In writing some years ago about **The Humanities In American Life**, the Report of the Commission on the Humanities sponsored by the Rockefeller Foundation, Hilton Kramer quoted from the study its basic premise that "the humanities are widely undervalued and often poorly understood." Kramer observed that the report "so systematically avoids any mention of our classic writers that one is left wondering what this committee has in mind when it speaks of the humanities. Is it really possible to discuss the fate of the humanities in our society without identifying at least some of the writings that are central to the tradition of humanistic culture? In this report we are given no clue" (**New York Times Book Reviews**, 28 December 1980).

Certainly the situation in higher education has not changed for the better if we are to believe those like William J. Bennett (**To Reclaim a Legacy**) who are appalled at the ignorance of students. Professor Hirsch (**Cultural Literacy**) deplores the absence of a body of shared knowledge, but is not particularly clear about why any body of shared knowledge is important to human beings trapped in a meaningless universe. Professor Bloom (**The Closing of the American Mind**) espouses an elitist theory of education but evades some of the most important questions by shrouding them in vague imperatives.

When we are informed that philosophy is important because it stimulates critical thinking, it is apparently felt by those who make that statement that the statement is self-explanatory, and self-authenticating, but in view of the facts that this statement has been made for decades by learned educators and teachers, and that there is no substantial evidence that such critical thinking is common in our classrooms, one might plausibly suggest that the statement is by itself inadequate. Critical thinking does not occur in a vacuum, one must think critically about something, and the something being examined should be important, of vital concern to students as human beings.

What are the issues and questions and topics that should be subjected to critical thinking? Why are they important in our opinion? If critical thinking is as important as educators claim it is, why do we not then require every student to take a course in logic? Why this reluctance to accept the logic of the statement? What prevents colleges and universities from requiring that every student be enrolled in a logic class? Does any experienced teacher really believe that requiring students to take a course from a group of courses in philosophy will be enough to enable them to learn how to think critically?

When we are told that a knowledge of history and the development of a sense of history is essential for all students, what history do we mean? Certainly not all of history! If we mean the Western experience, do we mean a survey course? If we do, does anyone imagine that an intelligent sense of history will emerge from one or two survey courses in Western civilization? We have had such courses in the past when higher education required them of all students, but the results were not particularly reassuring.

What do we mean by a sense of history? We obviously do not mean the memorizing of facts that will almost certainly be forgotten later. Is it enough to know that there was a great philosopher named Plato who believed in Forms or Ideas? If a sense of history is something other than facts, what is it? If we invoke Santayana's famous comment about those who forget history being doomed to repeat it, then what are the lessons of the past that will help us avoid making the same mistakes? Is this what we mean by a sense of history? On these and related questions our distinguished committees of educators are strangely silent.

The same reluctance to confront hard questions about the humanities characterizes almost all our learned pronouncements on the importance of the humanities. Those pronouncements have not been notably successful in infusing new life into the humanities. Are we by implication admitting that educators either do not understand these pronouncements or understand them in such different ways that no reasonable consensus is possible? Are we saying that political and partisan rivalries are so pervasive in academic communities that informed and responsible agreement can never be reached? Are declining enrollments in the humanities so frightening that our only recourse is imposition of general college requirements to insure the preservation of certain disciplines? Can the humanities stand on their own?

We are faced with one of two possibilities. (1) By themselves the humanities **cannot** substantiate their claim to an essential place in the curriculum. Or, (2) the case for the humanities **can** be made persuasively, but for some reason has not been so made. If the first is true, then the only practical solution is to fall back on general college requirements to maintain our place in the academy. If the second is true, then we need urgently to find out why the argument for the humanities has not been made. Perhaps it is because institutional politics inhibits arguments that go beyond expedience. Perhaps it is because the best arguments are so patently obvious to us that we neglect to present them at all. Perhaps it is because we feel apologetic about addressing subjective arguments to our "objective" colleagues. Let me suggest seven commonplace observations that might serve as a beginning, a way of justifying the humanities that goes beyond the platitudes, yet uses traditional language rather than sophisticated critical novelties.

First, if nothing else, **the humanities make clear how difficult it is to make sense of life**. No one familiar with our cultural heritage has to be told how perplexing has been the effort in all ages to understand the enigma of life. From the varied pressures that influence Achilles in the **Iliad** to the conflicts and tensions in Shakespeare's works to the picture of life in America in Ralph Ellison's novel **Invisible Man**, the enigma of life has been dramatized with extraordinary power and clarity. From the philosophical questions raised by Socrates in the Platonic dialogues to the Christian theologians to the radical empiricism of William James, the story of our search for truth and ideals has been charted with passionate intensity. Throughout the course of Western history, the hard questions raised have demonstrated a persistent hunger for ethical and spiritual principles.

Our history reveals the folly of the easy answer, the danger of fanaticism and self-righteousness, the inability of a single faith to establish and perpetuate itself without being challenged. We sometimes describe our Judeo-Christian heritage as though it constituted an absolute set of principles and values that represents the final answer to all our problems. Even a cursory knowledge of our history leaves no doubt that this was not the case. That there are certain values most of us can accept as essential does not obviate the fact that interpretations of those values have varied profoundly throughout the ages, even within established institutions.

Because the humanities dramatize and document that search for values in so many different ways, they are convincing reminders of how complex those issues are. They also reveal how deeply personal those issues become and how deeply rooted they are in human nature. The struggles of the past were not theoretical exercises of importance only to academicians and philosophers, but were implicit in the very texture of human experience. The classic confrontation between Antigone and Creon in Sophocles' play is not a conflict of abstract concepts, but the powerful struggle of two competing wills.

The humanities neutralize our tendency to simplify life, to reduce it to absolute principles. Pierre in **War and Peace** watches the battle at Borodino utterly confused about what is happening. Life is as baffling for Pierre as it is for Ishmael in **Moby-Dick** and Hans Castorp in **The Magic Mountain**. Montaigne pointed out that if we collected all the most profound thoughts of philosophers on the nature of reason and the human soul, we would be astonished at how dissimilar their definitions are. Montaigne learned much from the philosophers, but he also learned that life always eludes us, that human nature is not a simple thing.

Second, the humanities draw their strength from human experience, not from disembodied concepts and ideals. The humanities are perhaps the richest expression we possess of what being human means. The arts, history, philosophy begin with the raw stuff of human experience, our felt sense of life, the temporal conditions we all live within, the real pressures that influence us. They return us to the roots of our being, to the existential ground of all human experience, to the most basic of all truths--our subjectivity. They force us to see things as they are, how they function in human communities, how human beings think and feel and hope and suffer.

No one can read the great autobiographies without realizing how powerful the real world is and was for those like St. Augustine and Cellini who had to wrestle with themselves and the influences of social imperatives. The human conditions that affect all of us were urgent realities for men and women who knew that they could never escape completely from the experiential ground of their lives. What should impress us in reading Benjamin Franklin's autobiography is not the success story, but the detailed account of how Franklin learned to live within the human condition, drawing from it a set of values that was never divorced from that condition.

The greatness of a novel like **Huckleberry Finn** rests in part on its amazing particularity, its immersion in real human situations, its truthfulness about real people and real conflicts. Reality is the world Huck inhabits. His classroom is American society, its beauty and its ugliness, its heroes and its villains, its hopes and its tragedies. We may criticize its contrived ending, but the novel is a classic because it is real. The crowded and turbulent picture Balzac presents of French society in the first half of the nineteenth century is realistic and particularized, a society cruel at times, insensitive and competitive, unpredictable, yet recognizable as a society not wholly different from ours.

Third, the humanities focus repeatedly on the integrity and worth of the individual. If we learn anything from the humanities, it is this impression of extra-ordinary individuals. We remember Socrates patiently and resolutely pursuing his own destiny as a gadfly, Beethoven determined to express his own private genius, Schopenhauer articulating a very personal sense of life, Hamlet tormented by personal rage and the burden of his private doubts, Bigger Thomas in **Native Son** embittered by forces he cannot understand.

There is only one Beethoven, one Shakespeare, one Cervantes, one Rembrandt, one Sibelius. The search for selfhood is not confined to one age or one school of philosophy. It is writ large in the whole course of Western experience. The manner of its expression will vary from place to place and age to age, it may strike us at times as being fanatical, but it testifies to one of the strongest impulses in human nature--the hunger for selfhood. We sometimes imagine that this is only true of geniuses, but what they are driven by is surely not unique to geniuses. What they demonstrate is the urgency of that hunger, its determination to find a suitable mode of expression.

What the humanities make clear is that it is not enough to remain contented yuppies, to wallow in self-indulgence, to fondle the self in private. Mindless navel-grazing defeats itself, becomes boring. Being a real individualist means finding a way of expressing oneself without deferring either to social conventions or needless eccentricity. The humanities bring us closer to those individualists who, despite the constraints of their time, persisted in being themselves. Socrates made many enemies. Beethoven's music shocked some of his musical colleagues. The works of the French Impressionists were greeted by academicians with ridicule. Voltaire, for all his international fame, had to be wary of reactionaries and bigots. As Gustave Lanson explains, "Like a fox with the hounds in pursuit, he had, as he said, his front paws in Lausanne and Geneva and his rear ones planted in Ferney and Tournay" where he was safe.

Fourth, the humanities offer us something so simple and so obvious that we are tempted to treat it as self-evident--the eloquence of beauty. Beauty may be more apparent in music and painting than it is in philosophical works, but it is present wherever we look, wherever we open ourselves to it. It is more than the beauty of word or line or shape: it is the beauty of a noble conception attaining the immortality of form. The beauty of a creative mind opening itself under the impress of a noble conception is far more than an aesthetic joy independent of content and meaning. It is the beauty of greatness unfolding its riches with a grandeur and sublimity that transcend doctrinal principles and personal values.

Some two thousand years ago, Longinus, credited with the authorship of the treatise "On the Sublime," wrote of works distinguished by their sublimity: "For, as if instinctively, our soul is uplifted by the true sublime; it takes a proud flight, and is filled with joy and vaunting, as though it had itself produced what it has heard." It is this sublimity of concept and expression that creates a form of beauty that moves our whole being, our fullest sense of life, filling the mind and the imagination with something broad and deep and moving. It releases us from what is petty provincial, self-centered and grasping, and in that sense it ennobles what is best in us.

In his book **The Sense of Beauty**, Santayana wrote that "to feel beauty is a better thing than to understand how we come to feel it. To have imagination and taste, to love the best, to be carried by the contemplation of nature to a vivid faith in the ideal, all this is more, a great deal more, than any science can hope to be. The poets and philosophers who express this aesthetic experience and stimulate the same function in us by their example, do a greater service to mankind and deserve higher honor than the discoverers of historical truth." There is more than one Grand Canyon of the mind in the humanities!

What is beautiful escapes the confines of a narrow imagination, a constricted mind, an anemic obsession with insipid stereotypes. It broadens the very stuff of perception and feeling by liberating us from what is merely conventional and tepid. It is a sense of something ultimate and precious, an experience, not theory or idea or moral precept. Not to be able to feel it, is to become the victim of that deadness of the spirit Coleridge described so poignantly "Dejection: An Ode." To disparage it as sentimentalism is to disparage the very source of feeling and empathy, to make us ashamed of something felt deeply and eloquently. We may not share his mystical reverence for nature, but there is no doubt that Wordsworth's expression of this profound feeling forever emancipates us from the lovingly picturesque pieties of weekend vacationers and gift-book sentimentalists. Beauty is, as Keats said, a joy forever, always ours, impervious to time and corruption. Those who refuse to feel it might ponder a comment in William Congreve's play **The Old Bachelor**: "There is in true beauty, as in courage, somewhat which narrow souls cannot dare to admire."

Fifth, the humanities reunite us with the human family, not by precept or moral exhortation but by shared imaginative experiences, so vivid that the threat of the unfamiliar or strange or exotic is dissipated. We rediscover the power of the imagination, its ability to reveal forms of passion and intensity and aspiration we have never before encountered. We live with other human beings, in their minds and hearts, intimately aware of their hope and fears. We are not escaping from reality, but becoming one with it. We are not being asked to judge others, but to feel with them, to understand them, to range through the whole gamut of human emotions. We become Oedipus, Hector, Sappho, King Lear, David Copperfield, Eugene Onegin, Ivan Karamazov, Sister Carrie, Jay Gatsby and Holden Caulfield. We know them as we would never know them in our daily lives.

This is not identification with fictional characters existing in an unreal fantasy world, but imaginative involvement with characters who are recognizably human, who express more vividly what all human beings feel and experience. We learn how much we share with them and with our fellow human beings. Homer created astonishing characters who are as alive today as they were for the Greeks. Achilles is not an alien from another planet but one of us. Even the mad Ahab in **Moby-Dick** reflects with fanatical intensity our own rage and anger at the malevolence of evil.

Art, music, philosophy and history all in their different ways reunite us with the human condition. No one who has really heard Beethoven's Ninth Symphony can deny its heroic call to brotherhood and joy. Who would dispute the fact that in the magnificent paintings of Rembrandt we are not simply looking **at** human beings but becoming one with them. The more we learn about any period in history, the more we realize how human human beings have been and how much we share with them. The humanities enable us to free ourselves of that cultural provincialism that has always plagued American society. One symptom of that provincialism is our indifference to foreign films, our retreat to what is familiar and contemporary. The humanities offer us an opportunity to escape Plato's cave and its shadow realities. To live forever with shadows is to suffocate the soul, the mind, the imagination, to cripple us as individuals. The protagonist in Ellison's **Invisible Man** knows that he cannot remain for the rest of his life underground.

Sixth, the humanities teach us patience, a virtue not characteristically American. We cannot learn anything of value from the humanities if we lack the patience to open ourselves to them, to wait for what they can give. No reader, however intelligent, can exhaust **Moby-Dick** or **The Brothers Karamazov** in one reading. What makes the masterpieces of the past so important is the wealth of experience they contain. That wealth is not always discernible after one reading or one listening or a casual glance at a Rembrandt painting. A Platonic dialogue requires concentration and alertness and the willingness to return to it and explore it again.

Those who are bored with **King Lear** at age twenty may very well be excited at age thirty or age forty. We can no more understand important works at first contact than we can understand other human beings at first impressions. Some works demand enormous patience and experience and maturity before they yield up their treasures. **Walden** is a great work, without much question one of the finest non-fictional prose works in American literature. It is gritty, blunt, aphoristic, always challenging. It must be read carefully. The casual reader easily misunderstands what Thoreau is saying, fails to appreciate the crucial qualifications Thoreau is at such pains to clarify. Those who imagine that he is advocating total withdrawal from society have not read him with care.

The study of any historical period requires just as much patience. Tolstoy read everything he could find about the Napoleonic period before he wrote **War and Peace**, searching for an acceptable theory of history. He tested theories of history by returning to the people and events of the Napoleonic age. His detailed account in **War and Peace** of the invasion of Russia and the explanatory chapters in the novel reflect his rejection of almost all reductionist theories, a rejection he arrived at only after immersing himself in the period. It was St. Augustine who made an observation all of us should heed: "Patience is the companion of wisdom."

Seventh, the humanities make it clear that as human beings we must live within the bounds of life itself, that we cannot escape except through suicide or fantasy. If those who preceded us could struggle with those limitations yet create works that delight and move us and restore us to our common humanity, their example should convince us that strength, joy, beauty and wisdom are within our grasp. Life may frustrate and anger us, we may chafe at our bonds and cry out for Nirvana, Paradise, a heavenly Utopia, but with courage, patience, wisdom and respect for the human spirit, we **can** live as decent and responsible human beings. If Homer, Plato, Shakespeare and Beethoven were able to create in a very imperfect world, we can learn from them to make the most of ourselves in a brutal and frightening world.

We sometimes assume that life was simpler, happier, more fulfilling in other ages, that Socrates and Cervantes did not have to worry about the bomb, a population explosion, ecological disasters, violent crime, bureaucracy, competition, nihilism. No one familiar with Athens in the 5th century B.C. or Spain in the late 16th century would ever make such a statement. Thucydides in his great history describes vividly the plague that struck Athens. The society Cervantes shows us in **Don Quixote** is not free of greed, violence, suspicion, broken hopes, thwarted ambitions, despotism. In every age the conditions within which human beings lived imposed limitations and restrictions that were at times harsh and even tyrannical. There have always been individuals who sought to escape those conditions, like Goethe's Faust and Dostoevsky's Roskolnikov, but always were compelled to recognize and accept certain limitations as inherent in life and human nature.

What the humanities dramatize is how much is possible despite those limitations. The life of Helen Keller is a classic example. Every great artist has worked within the limitations of temperament and circumstance, limitations that in a strange fashion gave their works a distinctive coloring and texture. Mozart is Mozart in part because of those limitations. A visionary poet, like William Blake or Shelley, strives to transcend those limitations, yet it is those limitations that are implicit in much of what a visionary poet creates. We may agree that an artist's reach should exceed his/her grasp, but what is created is valuable because it helps us learn how to live as human beings within the natural order. Much depends on whether we see life as a prison or the natural world. We have far more freedom within the natural world than we have in a prison. Cynics have no doubt it is a prison. The humanities see it as the natural order of things.

The Faustian spirit in Western culture cannot abide limitation of any kind. It strains against confinement, the pain and anguish of the human condition, social constraints, all of the inhibitions that imprison the soul. We hear it in Hamlet's frenzied command to his mother that she purge herself of her human weaknesses, a command Hamlet himself cannot obey, tormented as he is by his own weaknesses, his failure to avenge his father's murder. We hear it in Nietzsche's deification of the Superman. We hear it from many in our own age who seek somehow to escape the contamination of the twentieth century.

But there is no real escape for even those sustained by religion must live out their natural lives within the human community. This is our world, the world of the humanities, the world where we can either believe in the dignity of humanity or conclude that human nature is so sordid and petty and destructive that only a fool would trust it. But is it really possible to love Shakespeare and Beethoven and Rembrandt and Plato and yet despair of life and humanity! Those who believe in the humanities know what they have done for those who listen and hear. Why should we imagine that we too cannot listen and hear? Nothing prevents us from hearing the Ninth Symphony! From hearing Shakespeare! From hearing the Gettysburg Address!

Those who **have** heard can never lose their most precious possession--their love of life. For when all the arguments for the humanities have been made and all the evidence produced and all the eloquence exhausted, what remains is our immense respect for life and humanity. Perhaps no artist has said it better than Joseph Conrad in the "Preface" to his novel **The Nigger of the 'Narcisus':**

> But the artist appeals to that part of our being which is not dependent on wisdom; to that in us which is a gift and not an acquisition--and, therefore, more permanently enduring. He speaks to our capacity for delight and wonder, to the sense of mystery surrounding our lives; to our sense of pity, and beauty, and pain; to the latent feeling of fellowship with all creation--and to the subtle but invincible conviction of solidarity that knits together the loneliness of innumerable hearts, to the solidarity in dreams, in joy, in sorrow, in aspirations, in illusions, in hope, in fear, which binds men to each other, which binds together all humanity--the dead to the living and the living to the unborn.

If the humanities can do what Conrad tells us the artist can do, why would anyone who loves life and respects human nature abandon the wealth of our cultural heritage? Why would anyone spend a lifetime pursuing what is shoddy and impermanent and demeaning? Why settle for Dr. Pepper when one can drink champagne?

USING ARTIFACTS TO INTRODUCE CULTURE

"The Techniques You Learn in this Course
will allow You to Determine Every Important Thing
There is to Know about a Culture
from the Design of Any One of its Common Artifacts..."

So I inform my students in Miriam Hall 205 each September, or anyone else who asks what I do in American Studies (AmS). Of course, I lie. No one can even identify "every important thing" about a culture. But then again, depending upon how willing one is to generalize, and on his or her definition of "important," perhaps I'm telling the truth.

This article describes what we do and try to accomplish in that course.

When the University of Dayton initiated its AmS Program in 1969, I was challenged with a course description which read "AmS 300. American Cultures: A study of American artifacts to discern how they indicate the periods of the life of our civilization and how like artifacts can be used to determine the stages of development of various peoples." That description has been a hard taskmaster because, even though I created it, I have never more than imperfectly understood what it implies about how the course should be taught.

In the summer months of 1968, as I cast the preliminary design of this proposed academic program into words, I sensed the description outlined an appropriate thing for an introductory area studies course to accomplish. I didn't know what I could do to fulfill the description's promise; I reasoned I could work out the details later. I had a well-developed notion about what the course should try to accomplish, and that has never changed. On the other hand, though, after teaching the course nineteen times, I have a good idea of what we do to achieve our goals and a less well developed idea of what we could do. I have no better grasp at all on what we "should" do. I don't think that will ever become clear, nor that the course could be as good or as important if it did.

In fact, AmS students learn that if they're not confused a few weeks into the course we'll have something to worry about. We've never had to worry. And then things clarify.

In childhood, perhaps in the Metropolitan Museum of Art, and certainly in the pages of the **National Geographic's** 1940's articles "Life in Ancient Egypt" and ". . . Greece" and ". . . Rome," I was indoctrinated: people live in distinct cultures whose designs we can imagine and attempt to recreate, and which, because they exist at such a psychological distance, are easier to see than the design of our own cultures can ever be. Part of the attraction of history has always been the apparent coherence, and the security of known rules, of earlier place-times.

An interest in many elements of culture pulled me out of literary studies after the M.A. and into American Civilization at Pennsylvania. Studies there both encouraged the notion that cultures can be known, and taught as well as a richer sense of "artifact." So the description of AmS 300 flowed easily.

What the course came to be in reality can be described as a delicious, if spicy, stew. The cook isn't able to describe all the elements chemically; you're not sure you'd use the same ones; you can't understand why some things are in there at all, and you suspect, but are not certain, the whole will prove healthful.

The featured element is an invention that I named **Polar Analysis**. You can read an earlier description in "Polar Analysis: Learning Much from Little" in the revised, 1972 edition of **Popular Culture and Curricula** (Bowling Green University Popular Press). But that article omits the pedagogic context that I incorporate here.

DEFINING "CULTURE"

AmS 300, American Cultures, begins with an introductory lecture in which newcomers learn that it is the first of a three-course sequence required of AmS majors. We discover the majors of the other students, determine what might have brought them into this course, and inform everyone that the grades of nonmajors, over the years, have averaged slightly higher than majors. The first of two texts is assigned; students have one week to purchase and complete reading Ruth Benedict's **Patterns of Culture**. While that is being achieved, students are also to find and record two definitions of the word "culture," three if they use one from the dictionary.

The students learn that each of the two projects they will complete will be worth 30% of their grades, and the open-notes open-book final the other 40%. The rest of the period is spent getting the participants used to the wide-ranging, questioning, apparently off-hand lecture style that will be employed during many of the subsequent hours. (Are Americans different? What has your ethnic background to do with your behavior? How much of our success is in our genes? Why are shoelaces?) Fortunately, the course is taught for a full semester and always in twice-a-week 75-minute classes.

For the next one or two classes, we put definitions of culture on the chalkboard and discuss their relative merits. Students learn that catchall definitions--culture is the sum total of everything the people of a distinct group do and believe--may be correct but are not easily helpful. We discuss elements like learning from earlier generations and like the possible patterning of culture traits.

We spend the next three classes on the first and last parts of **Patterns of Culture,** the parts the students did not enjoy or understand. We choose significant passages and reveal the thread of the argument that each is meant to help advance. Students begin to see that there are other ways to be human and that, though some are more or less attractive to a 20th-century American, all make internal sense and satisfy both individual and communal human needs.

FIVE AMERICAN CULTURES PLUS ONE

Then I divide American culture into five periods, recognizing that they characterize only the general culture and not the sub-cultures with which we are blessed. Many will recognize these periods, and will note the differences between my characterizations of these periods and other characterizations which are better known.

The first is the Theocentric, dated from the landing of the Pilgrims in 1620 to about 1720. New Englanders in this period measured everything by its relationship to God and to their personal salvation, centering their lives around their concept of God and his plan. We sense this period has ended in 1723 when Benjamin Franklin was not pursued even though he had illegally left the employ of his brother to whom he was apprenticed. As Anthony Garvan taught at Penn, a few years earlier such an action would have been seen as an offense against God as well as against humanity, and Franklin would have been chased and brought back.

The second is the Homocentric, dated from about 1720 to about 1810. In order to avoid the strife precipitated by religious convictions, Americans and Europeans of this period had surrendered their dedication to putting their religious attitudes first. They decided to emphasize the here and now and to make humanity in the whole the measure. The human intellect primarily, complemented by genteel sentiment, was trusted to direct humankind. Eighteenth-century American writers operated with such notions. But Bryant's later additions to "Thanatopsis" hint at something else which by 1830 Emerson (as had Beethoven before him) was demonstrating powerfully: western humanity could no longer deny the importance of an individual's instincts and emotions.

The third is the Age of the Individual, dated from about 1810 to 1862. Americans of this period used and celebrated their reliance on independent thinking and ways, on instinct and imagination. Each man was his own king, and any boy could aspire to be president. But Shiloh/Pittsburg Landing showed that the nature of war and of the warring culture had changed from one in which individual efforts were key to one in which the organization-as-machine dominated.

The fourth is the Age of the Corporation, dated from 1862 to 1933. In this period Americans encouraged monopolies in the name of free enterprise and, privileged corporations with the legal rights that individuals had enjoyed in the previous period. Further, Americans accepted almost any corporate or individual behavior which enriched individuals as long as it also seemed to enrich society and to hold out hope that everyone could some day be enriched. "Rape us," Americans cried, "but make us wealthy." They received what they wanted. But those who had come to resent that treatment were finally empowered by the Depression, and the next Age rode into power with Franklin Delano Roosevelt.

The fifth is the Age of Balance. Beginning with the New Deal, Americans have favored an emphasis on fairness which is seen, unconsciously, to be the surest guarantee of democracy. Each individual is to be given a fair chance at making a success of him or herself. And so is every segment of society, every group and subgroup, starting with the most obvious, the poor, and working through the ethnic minorities all the way to the largest and most subtly underprivileged group, women. For example, when, toward the beginning of the period, labor was seen as put upon, the Wagner Act passed Congress, but after the Second World War, when labor was thought to have become too powerful, Congress passed the Taft-Hartley Act to bring labor's power back into balance with that of management.

It is significant that each of the Ages, as they are identified and described here, is characterized chiefly by a quality Americans did not see to be important in the previous Age. Thus each is a reaction to the one previous, but not in so simple a way that each just repeats the second Age earlier. The Theocentric, it seems to me, was a reaction to the mercantilism of a previous time. The Homocentric (Neoclassic, Age of Reason) discouraged humans from expressing their religious passions to the injury of others, and, instead, encouraged the use of the intellect. The Age of the Individual (Romantic) reacted to the apparent cold-bloodedness of homocentricism by reemphasizing the importance of instincts and emotions. The Age of the Corporation recognized the inefficiency of unorganized individualistic and emotional behavior and replaced it with the standards of the engineer and the quartermaster. The Age of Balance tries to redress the imbalances which necessarily accompany untethered entrepreneurial capitalism.

The students in AmS 300 learn that if one were to try to predict the character of the next Age, and they come along on an average of every eighty years, one would have to look at the dissatisfactions which must accompany an attempt to keep everyone equally privileged. The students see that far left liberals in our system can be defined as those who believe that the equalizing process should be maintained as long as physically possible, those who favor "cradle to grave" assistance. Far right conservatives, the students see, are those who believe that birth into our society constitutes all the privileging anyone worth bothering about requires. Everyone of a more moderate political philosophy would continue such privileging to some stage of life intermediate between birth and death. I reveal to the students my suspicion that the next Age will try to move in the direction of greater social efficiency without creating a less compassionate society; that seems to be the way we are already heading and the increasing plenty which should accompany a breakthrough in fusion technology would make such a society affordable.

UNDERSTANDING 35mm SLIDES

Following this outline of past and future, we begin to study slides.

They are divided into six groups, and we take the entire term to get through them. The first group are of artifacts from other "less complicated" cultures, as anthropologists call them. The second through the sixth of the groups of slides are of artifacts from each of the five Ages of American culture.

Before the first picture is cast on the screen in the semi-darkened room, the students must learn about a vital technique. They are not to apply their intellects when they first see an artifact; they are first to feel it with their emotions. They must let it touch or push or punch or seem to avoid their emotions. Then they must ask themselves what just happened emotionally, and how they feel about this artifact.

The first slide pictures an African mask which seems sad to many of them, to others afraid, to fewer angry or frightened or serene. And they are right that its message is ambiguous. But ambiguity does not characterize everything they will see in class or out, so they must begin to understand that artists and craft- persons and architects are involved emotionally with their work and often expect their audiences and users to receive emotional messages.

The second thing students learn from the slides results from this question: "what are you looking at?" They suggest a mask. "wrong." They think that maybe it's a plaque. "Wrong." A picture? A brooch? A weapon? "wrong." They begin to think. A screen? "True, but more than that." In a minute or two they have worked their way around to or been told the answer. They "are looking at a reflection of a projection of a transparency of a photograph of a mask." They learn that such an experience does not tell them how large the artifact is, that from such evidence they can only guess at such things as an artifact's texture, weight, odor and substance. Even its color can have been distorted in one or several of the steps that brought that projection before them, and, in fact, the slide itself may now be faded. The students must understand the limitations of the evidence from which they may be drawing sweeping generalizations.

The third thing students learn from the slides is that artifacts often do not reproduce things as they would be reproduced by photography or holography. They hear that the first thing they must look for, whenever they first begin to analyze an artifact, is distortions. They learn to notice that the mask before them, though realistic to an unanalytical eye, could not possibly represent a real human being. The chin narrows sharply to a point; the forehead bows out and in; the eyes appear in a horizontal crease; the nose is unusably slender, and, most extraordinary of all, a high narrow ridge descends down the forehead from the hairline to the line of the eyes.

The students are to remember those three things for the length of the term and beyond. Feel the artifact emotionally before you analyze it. Understand the limitations of your evidence. Always look first for the distortions.

We use over two hundred slides, flashing past some, spending an hour on one, typically using three of four minutes analyzing each of several, the students attempting to answer posed questions, before turning on the lights again and returning to the standard lecture-discussion mode. The largest group of slides is of furniture (which can skew analyses too, since the furniture of the poor is not likely to have survived). Others are of buildings, gardens, interiors, paintings, illustrations, advertisements, weapons, and so forth. The subjects were not chosen carefully but randomly, chiefly from books of many types in the university library. Most of the slides themselves were created for a modest fee by a teacher in the fine arts department. A few were purchased at and depict the estate of George Mason, Gunston Hall. Pictures of practically any artifact will serve.

Truths jump out at you from those images.

Almost anything from several decades of the late-nineteenth century shouts of complexity and a compulsion to fill spaces.

Three particular slides teach us much about the differences between the Age of the Individual and the Age of the Corporation:

In the first, from 1820, two hunters on horseback, far in the distance, have shot two deer. The animals, with unbelievably large eyes, are crumpling gracefully to the ground right in front of us beneath a gentle overarching tree. It is impossible to miss the message that these are two lovely beings, and they die, with those expressive eyes, like celebrated heroines. They are individually significant.

The second two slides, printed together on a single book page in the 1870's, tell a different story. In the first, a pronghorn and a riding hunter have leaped almost simultaneously, slightly toward our right, from a four-foot embankment. The hunter has just expertly but casually fired his rifle with one hand; the bullet has no doubt entered the pronghorn who will, in the next few seconds, crash dead to the arid ground. But the animal's eyes, like his posture, are expressionless. The horse too is rigid, preparing to land. The second of these two slides shows us the backs of hunters on horseback, in the middle distance, who are holding their rifles vertically in one hand and shooting without aiming into a flying river of geese passing overhead. The hunters are apparently unable to miss, and crippled birds rain toward the earth around them. In neither of these slides is any emotion demonstrated. No individual, human or animal is significant. All seem parts of a machine.

POLAR & ATTITUDINAL ANALYSIS

During the first days of looking at slides the students learn about and begin to practice "polar analysis" which is based on these principles:

> Maleness in design is indicated by spareness, angularity, straightness, slenderness, and phallicism; femaleness is indicated by fullness, roundness and womblike receptivity.
>
> Elitism in design is indicated by complexity, by superior and inferior heights, an emphasis on verticality, an emphasis on distinctions, and a lack of stress on bodily comfort; equalitarianism is denoted by simplicity, by a leveling of heights, an emphasis on horizontality, an emphasis on likeness, and attention to bodily comfort.
>
> Rationalism in design is composed by the symmetry of intellected forms and develops intentionally from traditional forms; intuitionalism is composed by organically asymmetric forms and prefers change and newness.

Polar analysis indicates the nature not only of the separate articles studied but of the culture or cultures that produced them. One important tenet of the course is that a culture's artifacts always reveal either what a culture already has or what it wants, usually the former; therefore, equalitarianism in an artifact tells us that the originating culture is/was or wants/wanted to be characterized by that quality.

To introduce polar analysis so briefly as here is to inspire questions and to stimulate concerns and challenges. The space here is inadequate to treat them, and I believe they are answered and met in my earlier article.

That article emphasized the process of polar analyzing a Benin leopard statue to convince many students that such analysis can be trusted and used on all artifacts. (Those who do read of that episode may share such conviction long enough to try polar analysis for themselves.) Throughout the rest of the term, polar analysis is used on many but not all of the artifacts viewed, oftentimes being initiated by the students.

And "attitudinal analysis" is used just as enthusiastically. Even before I developed polar analysis I had sought to find other ways to study the meanings of artifacts, and it seemed that such a comparison would have to be made on the basis of meanings about phenomena that are found universally. Choosing quickly, I decided that every artifact must say something about its creator's and culture's attitudes toward at least some of five subjects: **humankind, God, nature, status,** and **change**. Studying such attitudes as they are revealed in artifacts also helps us to understand, as the course description puts it, "the periods of the life of our civilization and how like artifacts can be used to determine the stages of development of various peoples."

Unfortunately, it is not as easy to describe the qualities of an artifact that reveal attitudes toward humanity, God, nature, status, and change as it is to describe the qualities characteristic of the polar phenomena. The students and I must simply apply what seems to us to be logic. For example, we derive from our own primitive understanding that "above and higher than" are almost always more powerful than "below and lower than." We see, deriving from that truth, the superior status of tallness, and conclude that high heels and hats are claims to status, that tall-backed chairs such as thrones are so as well, and that churches and office buildings often seek height for similar reasons.

Of course, all these deductions about attitudes toward status are closely related to ones we make about elitism in polar analysis. In a similar way, the deductions about attitudes toward nature are related to the polar analytical quality of intuitionalism. Sometimes, too, the only evidence of an attitude toward God derives from the polar analysis of elitism, an elitist culture almost certainly requiring a supernatural structure to support the design of its social structure.

Attitudes toward humans can also be linked with polar analysis when both attitudinal and polar analysis are brought to bear on artifacts which help make human life more comfortable. But such linkage is not characteristic in the case of every artifact created for association with humans. Nor can change be logically linked to the results of polar analysis.

One clue towards a culture's attitude toward humans, for example, is the design of doors. The more ornate the door and doorframe, the more elevated the culture's estimate of the people who will walk through.

One more example. It is fascinating to measure attitudes toward God by observing where congregations place the steeples on or about the

846

churches they build. Steeple seems to denote God. George Washington's Pohick Church, which he designed, is without a steeple, implying the Deist notion of people's basic disassociation from a benevolent but uninvolved God. With like reasoning, we can learn much from churches which put their steeples directly over the middle of the church, as does the Puritan's "Old Ship" in Hingham, above the entryway or vestibule, or even, as do some of the 1960's and 70's churches, apart from the rest of the edifice.

Both polar and attitudinal analysis are performed with these three obviously unoriginal assumptions in mind:

*Every manifestation of a culture has features which are identical in psychological role with features of other manifestations of the same culture.

*By analyzing various manifestations of culture, we can determine if they are produced by the same culture and, by logical extrapolation, can draw some conclusions about the nature of that culture from the nature of the common features of those manifestations.

*Neither fashion nor technology ultimately dominates the subconscious cultural reasons for long-range design developments.

Because this is a course in American culture, I add this assumption:

*America has been a series of general cultures interrelated with and/or largely independent of various more slowly changing subcultures.

It is in light of these assumptions, and through using polar and attitudinal analysis, that we presume to be learning, from any common artifact, "every important thing there is to know about a culture."

TEAM RESEARCH

At about this time in the course, after three weeks or so and, as the students are always slyly reminded, after the day they would be allowed entry into a different course, they learn about the first project. (Warning of this procedure was given the first day.) They are to form teams of three. (Sometimes there must be one or even two groups of two, but never any of four.) Since it can be that men and women see things differently, each group should number at least one member of each sex. Teams would also be wise to include one person who can write more skillfully than the average student and, possibly, one who has access to a car.

Each team is to discover three artifacts, preferably American and certainly at least thirty years old. (They must discuss the candidate artifacts with me before going ahead so that I can prevent them from choosing artifacts with which it would be unnecessarily difficult to work. They will find that I usually recommend artifacts with more rather than fewer obvious design elements.) Teams will then meet to perform both polar and attitudinal analyses of each artifact. Team members are then to discover whatever they can about the artifacts by doing standard historical research, if possible, including whatever interviewing they can. They are then to do a careful comparison and contract of their analyses with the results of their historical research. All of this is to be written up in a paper, including adequate photographs of each article, and submitted in five weeks.

Each team member will also separately submit a journal of the work performed for the project both by himself and by his or her peers. Those journals will be graded for honesty and completeness. The team is to receive one grade for the project, but for the individual student that grade can be raised or lowered half a letter, or kept at the original level, depending upon the quality of the journal. No remarks made about any other team member can have any effect on the grade that other student is awarded.

Artifacts chosen for this project have included jewelry, furniture, bridges, a tower, buildings and building facades of every description, lampposts and water fountains, tombstones, an ornately carved bar with attendant mirrors and caryatids, a tomahawk, bookplates, pulpits and lecterns.

Each year one or two teams fail to heed some important advice; they divide the work and have each of the three of them do the total analysis of one artifact. Those teams always produce substantially inferior papers. Some other teams divide the historical research by artifact; in the majority of cases, it does not seem to hurt the group effort if no complex interviewing can be accomplished.

Space considerations forbid a lengthy example of the kind of work such teams do, but it is often impressive. After careful analysis, one team identified a bookplate featuring a helmet, a sun, starred dogs and a shield as having been produced by "a twentieth-century European research or astronomical society." They were gratified to learn that the bookmark belonged to "the United Kingdoms Atomic Energy Authority." That is a spectacular and unusual bullseye, but the intelligence of the analysis which led to it is characteristic of the work of many of the teams.

Of course, many problems attend the work on these papers. For those whose writing is clear, the two main ones are, first and expectably, a lack of adequate logic and, secondly, the difficulty of avoiding what I call "culture-dominated" remarks, comments which spring from the students' understanding of life as learned in this culture but not shared by the culture which produced the artifact under study. The most primitive of these remarks will identify an artifact as ugly or at least unattractive. In other cases, an artifact or an element of an artifact may be seen as silly or inefficient or useless. The impropriety of such remarks is always noted in the teacher's editorial comments.

When every team has submitted its paper, the students learn that the grade they individually receive for this first project will count only if it is higher than the grade each student earns for his or her second project. Some take good advantage of this opportunity which is offered them particularly because this course requires them to achieve things markedly different from any heretofore required of them.

The problems of judging from the point of view of one's culture is only one of many subjects that comes up naturally in such a course. Here are five brief references to some of the others:

--Lord Acton's prescription that "Power corrupts and absolute power corrupts absolutely." is accurate as far as it goes, but there is an equally important corollary: Responsibility ennobles, and absolute responsibility ennobles absolutely. For examples of each, we review the stories of Pope Alexander VI and of Chester Arthur.

--We must be careful not to change things without knowing all the ramifications of the old and of the proposed things and ways. Yet we must be alert to the need for logical change. Giving up on flattening their babies' skulls, the Flatheads took their babies from their papoose boards; when babies started being killed by the dangers inherent to their crawling around, the Flatheads learned that skull flattening was not the original intent of carrying babies on their backs. On the other hand, British artillery sergeants came close to the D-Day invasion still having members of their crews stand to attention as their guns were being fired because that posture most closely approximated the one in which those same men would earlier have been holding each artillery piece's team of horses.

*Revolution never works. It changes things too quickly for a culture's comfort. Any that seems to have succeeded was actually evolutionary. The French Revolution, a real one, was quickly overthrown and more familiar forms of government reinstituted. The American and Russian Revolutions, which did succeed, simply replaced the people at the top without substantially changing the form of government with which each culture was familiar.

*Each cultural institution is always part of the web of such institutions. Pre-martial chastity is always more important for cultures in which wealth is distributed along bloodlines.

*Cultures, like human beings beyond childhood, begin in strength and ignorance and end in weakness and wisdom.

INDIVIDUAL RESEARCH & GRADING

On the day the first project is due, the students learn the nature of their second major task. Working individually now, they are to produce for each of the next ten classes, representing most of the rest of the term, a short paper which reveals some original thinking, questioning, research and responses about some "interesting" fact of their culture. They are to react quickly, perhaps instinctively, to things they see about them. As an example, I ask them why one exterior door on campus is secured with an expensive brass handle lock above which the door is almost entirely nonalarmed glass. I ask them why a Catholic university displays almost no religious symbolism in its classrooms, though some classrooms show the marks left by crucifixes now removed. I ask them why people wear earrings. I ask them if they can measure any significant changes in life understanding or in attitudes between freshmen and seniors. I hope that such questions may help them get started.

The ten papers will be edited and commented upon, the students learn, by the class period after they are submitted. The grade for the project, however, will be earned only by all ten papers, read as one continuous project, at term's end. The students can be confident, therefore, that early inadequacies will not count much at all compared with later successes achieved by learning from the editorial comments on the earlier papers.

These papers yield a large number of issues and considerations worth serious study by experts. Such topics cannot be adequately treated in part of half of an undergraduate's week. But most of the students soon learn that they can produce, even with that amount of effort, meaningful evidence of opinions held among the microcosm of American culture represented by the university community. Similar research has also been carried into their workplaces by the older students who are working for a living as well as to the downtown streets and shopping centers of Dayton, Ohio and its suburbs, an area widely recognized by marketing consultants as typical America.

Here is a sampling of the subjects most recently treated: bar codes, ergonomics, speeding, education and foreign car ownership, images of work and play in advertising, tie-wearing, rock music and drugs, portable chairs, restaurant buffets, anti-female violence, and church attendance.

Even though the last weeks could easily be spent in nothing but discussing slides and second project papers, we reserve two periods for other integrative material.

In one we discuss the term's second text, Richard Leakey's **The People of the Lake**. It shows how early humans created culture and also demonstrates the forceful use of evidence to argue for one interpretation of human nature.

In the second of the two reserved periods we view the 11th of Sir Kenneth Clark's **Civilization** film series, "The Fallacies of Hope." It shows the students still another way of integrating massive pieces of the puzzle of their historic culture, beginning and ending with two remarkable artifacts, a rococo library and Rodin's statue of Baudelaire.

The final exam, as the students were told the first day and every time they asked thereafter, is a series of questions meant to give them the opportunity to demonstrate what they know in all the areas covered by the course. They are asked, for example, what they learned from the slides, from their readings, from the other lectures, from their projects. They are given as long as they like to complete this exam, the typical student finishing in from just under two to just over three hours.

Here are some of the answers most likely to be of interest:

"What seem to have been the goals of the course?"

--"To make us more aware of the world around us [and] that we are part of a culture."

--"To teach us how to view our culture effectively. . . to develop an ability to speculate about the future by looking at trends of the present . . . to make connections between disciplines."

--"To teach a new awareness of individual things--to teach that no manifestation of any society stands alone. It can teach a great deal about the culture that produced it, if only one knows how to read the signals."

"What was to be learned from viewing and discussing the slides?"

--"To look at artifacts as representations of a culture, that can be read as a record of what is important to that culture, was a new concept to me."

--"The slides give concrete examples of the way artifacts reveal a culture's attitudes and beliefs. They also helped develop analytical skills pertaining to cultural analysis."

"What have you learned from your two projects about the methods of studying a culture?"

--"To really study a culture one must first rid himself of all preconceptions and biases."

--"I learned to collect sample data so as to look for traits and trends in American Culture. In order to test hypotheses about traits and trends, I had to collect data. I learned to use techniques of data collection such as the face-to-face interview, the questionnaire and the compilation of statistical data."

--"A necessary humility [since] one cannot study culture from the point of view of 'What did they do wrong?' but rather of 'What did they do differently, and why?' . . . One needs objectivity."

This exam, like the second project, is also read as one continuous essay and awarded a single grade. Grades have ranged from 102%, for work far better than could be expected, to D minus. The grades usually cluster in the C plus to B minus range, which may say more about the teacher as a grader than about the work of the students. However measured, these open-book open-notes exams always demonstrate the differences which exist between students as students.

The commonest final course grade is B. Many earn A's or C's. Grades lower are almost always earned only by those whose work is incompleted.

HOW FAR CAN THESE METHODS GO?

Though it does not as yet constitute part of this course, I have been working on one other element which ultimately must be included: The application to the great **nonvisual** art of polar analysis and the other principles we use.

Listening to the squeezed notes of Billy May's orchestra, for example, one cannot miss the reality that his is a stylized music, a type weakened and overintellectualized and ready to crumble before the aggressive sounds of rock.

In music too the emphasis on differences in heights marks elitism, though here the differences are in the melody--the Capulet's ball in Prokofieff's ballet, **Romeo and Juliet**--or in the volume or rhythm. Equalitarian music--as in folk or "I'm Dreaming of a White Christmas"--features melody lines that rise and fall in easy stages, that are calmer in volume and rhythm.

Maleness in music is discovered in the opposite of female receptivity, a quality I call "projectivity." It emphasizes more assertive rhythms and volume changes, and sharper, less comfortable intervals than the softer, more curved shapes of female rhythmic structures, volume modulations and melodies.

Rationalism and intuitionalism in music is a more complex subject needing further study. It can be asserted, for example, that repetition is generally rational, establishing symmetry through time. But many repetitions, as in Indian **ragas**, can be quite intuitional, calling to the subconscious rather than the intellect.

Music can be analyzed attitudinally as well. If not, why are some chords and combinations of sounds so easily associated in our minds with worship? And why do others conjure moods of uneasiness and even fright? But, deserving as it is, this material is not taught except practically and narrowly in composition courses, and we cannot do it justice here.

In any case, every autumn without .fail another crop of students in AmS 300 begin to learn how to "determine every important thing there is to know about a culture from the design of any one of its common artifacts."

HUMANITIES EDUCATION
CONNECTIONS

Ideas and materials for better teaching and learning in the humanities.

Sharon Scholl

The Humanities Major: A National Survey

The standard directories which compile college and university data in terms of major programs list between them 184 humanities majors currently in operation. The design and catalogue description of these programs is the subject of this report, which includes only programs at the Bachelor's Degree level, though many community colleges offer programs designed for an Associate Degree. The 21 programs listed at the Master's level and the four at the Doctorate level are also not included. There are other important matters excluded, such as the disciplinary derivation of the faculty and the institutional structure within which these programs operate. In brief, this is a report on the information that can be obtained by careful perusal and comparison of catalogues from a wide variety of institutions. Many of those programs will not be mentioned specifically in deference to an article-length format. Those which are specified do not necessarily represent the best programs, in my estimation, but rather illustrate most clearly the boundaries of a particular tendency.

Where are such programs located, and in what institutional settings do they appear? The diversity is astounding. There can be large, varied programs in small colleges (Stephens) and cursory, non-committal programs in large institutions (Colgate). Though the bulk are found in standard institutions dominated by a post-high school age student body, some of the most inventive are found in decidedly non-traditional ones (Lincoln). The materials described are also less than predictable; the Stephens College program is entirely fine arts based, while the Ohio Wesleyan University program is almost entirely literary. Perhaps the most annoying discovery is the fact that 102 of the listings are not for interdisciplinary humanities at all, but for humanities departmental structures with standard offerings.

What is the purpose of a humanities major; what is it supposed to accomplish? Most catalogues do not explain the nature of or need for such a major. A few do offer some guidance, hopefully asserting the social benefits expected therefrom. Drake University explains: "We live in a society characterized by accelerating change, radically new speeds of technological development, a complex bureaucracy, a sense of loss of control of our private and corporate destinies, and an apparent selfishness." The humanities major, one assumes, by inference, is to be

854

an antidote to these conditions. More descriptively, Wayne State University's catalogue comments: "The Humanities curriculum focuses on the symbolic ways in which human beings represent their experience. By means of a multidisciplinary approach, it examines the relationships among such diverse humanistic disciplines as art, music, literature, history, language, and philosophy." Prosaically, the University of West Florida offers its program partly for those unfocused students who "have not yet decided on some concentration." Then we find more practical statements such as that from Dowling College: ". . .provides students with broad and balanced knowledge of literature and culture while affording them an opportunity to develop their ability to organize and present ideas clearly and persuasively, and to converse in a foreign language." Drexel University points more specifically to a career outcome: "intended to produce well-educated and imaginative graduates equipped with the requisite skills and attitudes for successful entry into professional communications." The endeavors for which universities believe humanities majors serve as good preparation are graduate school, law, the ministry, careers in service-related occupations, teaching, librarianship, foreign service, and medicine.

One of the motives of this research was to arrive at an inductive definition of the humanities. The theory was that though we wrangle over a deductive, conceptual definition, in practice we do the same things. This proved to be true if one considers only broad, general patterns of design and content. The directories must provide no criteria for the institutions to use in deciding upon their inclusion under a humanities rubric. Of the 184 programs listed as having a major, only 36 contained the characteristics that would be familiar to us in interdisciplinary humanities. Another 20 had a set of general distribution requirements spread over specific humanities and fine arts disciplines with one or two unifying interdisciplinary courses. Another 37 had that distribution system without unifying courses. A group of 65 simply had a humanities department, collections of separate disciplines with no selection option spread among them. The remaining 26 had no catalogue available in any research format.

Among the 36 universities which have recognizable interdisciplinary humanities majors, there is a marked variation in the number and variety of courses offered. The University of Louisville lists 34 distinctly delineated courses; Stephens College, 28; the University of Toledo, 22. Florida State University has a program that extends from sophomore to doctoral student level in only 15 courses. A norm average of all programs tabulated is from six to ten courses (not counting independent study, internships, etc.). In addition, there are distribution requirements in specific humanities disciplines.

FOUR COMMON MODELS

Within the major program the most commonly used curricular model is the **Western Culture sequence** in a multi-semester design. Especially in small colleges, this sequence often serves as part of the core requirements for all students. Humanities majors may be offered additional detailed Western Culture studies. For example, California State

University at Sacramento offers an Introduction to the Humanities (two courses) followed by five separate detailed studies ranging from the Renaissance to modern times.

The History of Ideas sequence differs from an interdisciplinary humanities group in that History of Ideas is predominately literary and philosophical, whereas humanities includes the fine arts. For example, the University of South Dakota has a Classical Humanities sequence which begins with a course in scientific terminology and continues with linguistically oriented courses based on Greek and Roman language and culture. Pepperdine University distinguishes between its Human Values major based in social and natural sciences and philosophy, and its Humanities major, which uses the Western Culture model.

Within this culture-history format the newest development is the adoption of global perspectives. Not simply large institutions (University of South Florida's East and West course; San Francisco State's courses on Asia and Mexico) but small colleges (Coe's Non-Western Studies; Marygrove's Latin American and African Studies) are part of a national trend toward global humanities literacy.

The next most frequent inclusion in a major program is the **survey of fine arts**, possibly featuring attendance at concerts or art events, as in the "Tapestry" course at the University of West Florida. John F. Kennedy University offers "A Day at the Gallery" with group attendance and individual review paper assignments. Nova University even offers "Community Singers" under a humanities designation. Film history and criticism also appears occasionally (University of Louisville; Converse College). Marygrove College bases two courses on the Kenneth Clark "Civilization" film series. San Francisco State University has three linked courses based on the arts--Non-verbal Humanities, Criticism, and Styles of Expression. Stephens College has a wide array of upper division arts electives, and Eastern Washington University follows its general introduction to the arts by specific courses carrying parallel titles: Dance in the Humanities, Music in the Humanities, etc.

The third most common model is the **thematic** one. Not unexpectedly, the diversity of specific courses is such that no useful summary can be drawn from a research tabulation. The Science, Technology, and Values alternative is more represented than any other single topic. Women's/minority interests and topics of cultural-sociological relevance form a notable class. "The Devil in Literature," "Computers and Folklore," "Art, Literature, and the American Land," and "Images of Labor in Arts and Literature" are just a few of the intriguing thematic inventions of the interdisciplinary mind.

A fourth model is what might be termed **methodological**. Such a course explores the ways in which humanities can be studied, the principles of analysis and comparison appropriate to inter disciplinary activities. There is a wide divergence of opinion as to where such a course should be placed within the curriculum. Northern Arizona's Approaches to the Humanities, is the first course listed in that ample curriculum. At Stanford it is the last course listed in the Ph.D. program: The Theory of Humanities and the Function of the University! Drexel University offers Metaphorical Thinking as an upper division elective, and Xavier University offers The Language of the Humanities at the graduate level. These, then, are the four standard guises in which interdisciplinary humanities appears at the university level: culture/history, fine arts survey, thematic and methodological.

OTHER COMMON CHARACTERISTICS

There are a few other nearly universal characteristics of the humanities major. One is its ease of acquisition. Most courses have no prerequisites and are available to students without prior experience. Senior seminars, independent study, and internships are generally the exceptions to this rule. Aside from an initial Western Culture survey (which may be required in the general education program) courses seem not to have obvious precedents and consequents. They are arranged as a display of equally available alternatives at a similar level of difficulty. The other notable feature is the highly expressive nature of humanities programs. Courses exhude the tang of specific interests of instructors (Yale University's "Individual Portraits of Self in Renaissance Arts and Letters") and regional characteristics of our nation (San Francisco University's "The California Scene").

Humanities major programs have responded to pressures inside and outside the university. Northern Arizona University includes what is clearly a "service" course: "Introduction to Arts Management," as does the University of Central Florida in its internship in fine arts administration. Stephens College offers Introduction to Museology, and Drexel University ties its humanities major intimately to a communications area. Stanford characterizes its humanities offerings as part of an honors program and uses the rubric as an umbrella for various interdisciplinary models (American Studies, Medieval Studies), thus responding to certain internal, structural needs of the university.

Course offerings in humanities are responsive to regional characteristics and to the status and experiences of students in remarkable ways. Miami-Dade Community College (Florida) offers a course on "Human Liberation" centered on forms of oppression, cultural expectations, and men-women relationships. The suitability of this model to a student population with high representation of Blacks and Cuban and Haitian immigrants is obvious. Similarly, the University of South Florida has a course on "Latin American Arts and Letters," while Valencia Community College in Florida offers travel-study experiences in art and anthropology in Mexico. Stephens College responds to its predominantly female clientele with a course on "Women in the Humanities," and to its Missouri location with "Arts of the Old South." San Francisco State University offers a course on San Francisco, and California State Polytechnic University lists "Human Values in Agriculture." The University of South Dakota tailors the heart of its humanities major to issues of the Upper Midwest, offering: "Cultural Components of Rural America," "Environmental Ethics," and "Art, Literature, and the American Land."

Humanities major programs fall somewhere along a continuum representing size and detail. At the scant end are programs such as that at Biola University in California. It offers an interdepartmental major with concentrations in classical studies, communications, English, literature, language, history and philosophy. A student selecting such a major takes eighteen units in one area with six units each in two supporting areas. There is one interdisciplinary course of seven units dealing with "the shaping of human culture and thought to contemporary times."

The humanities major at Jacksonville University falls into the moderate center of the continuum. At the core of the major is a Western Culture sequence of four courses, with additional courses in American Culture, Humanities and Fine Arts, Humanities and Social Issues, and Humanities and Science. Students majoring in humanities education have a course in the methods and materials of humanities instruction. In addition, students must elect one course each in specific disciplines of the fine arts, religion-philosophy, literature, and contemporary world studies (the non-Western component).

At the more elaborate end of the spectrum is the major program at Northern Arizona University. A required core of a two-course Western Culture survey and a senior seminar is completed by 26 course hours chosen according to student interest. The available choices are many and diverse, for example: "Man and the Arts," "Great Themes in Western Literature," a sequence of Asian courses, "American Ethnic Arts, Ideas, and Values," a detailed six course Western Culture sequence, "Arts and Religion," "Visions of Utopia," and much more.

SUMMARY

The summary impression gained from this expansive survey is that Humanities major programs reflect a scholarly endeavor with three major educational goals:

+to inculcate in students a basic literacy with regard to the Western way of life as it has developed through history

+to provide students immediate experiences with humanities materials and guidance to think critically about their meaning

+to provide connections between humanities materials and the significant issues and conditions of modern life; to use humanities content to structure and guide life in all its diversity.

For readers who wish to explore the array of well designed, reasonably ample humanities major programs, the following list is offered as a suggested starting point rather than as a complete, all-inclusive directory.

University of Alaska (Fairbanks)
Arizona State University (Tempe)
Northern Arizona University
Stanford University
John F. Kennedy University
Lincoln University
Florida State University
Jacksonville University
University of South Dakota
University of Louisville
California State (Sacramento)
University of Louisville
Wayne State University
Stephens College
Dowling College
Ohio Wesleyan University
Drexel University
Wofford College
Pepperdine University
San Francisco State
Yale University
Coe College

University of Colorado (Boulder)
University of South Florida
Bemidji State University
Suffolk University

Sharon Scholl
Professor of humanities
Jacksonville University
Jacksonville, FL 32211

Jonathan B. Conant

Does the Humanist have a Special Role in Advisement?

A recent request that I let my name be put into nomination for an all-university undergraduate advisement award forced me to think about my style as an advisor, since I had to draft a statement to support the application. A nasty business, this, that suborns one into a conniver at one's own congratulation and so amplifies the pain of rejection! But the process did force me to think about advising in a more structured way than is usual with me, and out of that thinking came the conviction that most advising is geared towards making advisees comport themselves in a manner agreeable to the institution and to a discipline. Advisement practice seems to say: the university exists, and once **you** find your niche in it, **we'll** tell you what you need to do. As I note below, if that attitude was realistic years ago in foreign lands, it is certainly a figment of cloud-cuckoo-land in modern America. And if advising teams made up of the unholy three--the registrar, the major advisor, and the college catalog--once worked, it may well be that now the wide-ranging interdisciplinarian typically found in humanities programs is the advisor **par excellence** of the present and future.

Let us look at those students in the modern American college or comprehensive university, at what they need from their advisors nowadays, and where they may most likely find it. But first, an anti-apologia.

In 1795-96 the German poet and dramatist J.F. von Schiller published an essay whose title (**Uber die naive und sentimentalische Dichtung**) might be translated "Concerning the contrast between primitive and reflective poetry". Poets like Homer, Shakespeare, and Goethe are--for Schiller--"primitive" in the sense that they simply do poetry, the world about them suffusing their consciousness and automatically emerging as epic, drama, or verse. Schiller regarded himself as a "reflective" poet who needed to set to work like an artisan, drafting, revising, failing, occasionally getting it right, and throughout trying without much success to construct a formula or recipe for successful art. While I do not mean to elevate a productive advisement session to the status enjoyed by **Hamlet** or **The Odyssey**, it does seem to me that Schiller's contrastive scheme works pretty well for academic advisors, and that I am more primitive (**naiv**) than reflective (**sentimental**) as an advisor. It is, seen in this light, nearly foolish for me to pontificate on "the concepts underlying [my] approach to academic advising" (as called for in the award application).

Let me begin then with a premise, namely, that the **General Bulletin** (one of our names for the college catalog) is a stopgap measure whose very existence suggests the failure of academic advising in the modern American college or university. Suppose students' interests actually matched faculty expertise, so that they were spread evenly among the professors; suppose the secondary schools had weeded out all but those students likely to profit greatly from higher education (this is done in Europe); suppose the faculty were united by a common understanding of purpose and were not answerable to outside agencies or internal administrations: under these suppositions each professor would guide ten or twelve students already devoted to the field through a course of study both tailored to the student's training and expectations and also loyal to the institution's fundamental purposes. There would be no need for a **General Bulletin**. Advisement as a distinct activity would not exist, since advising would be undetectably woven into the process of education.

But in the modern comprehensive university--and possibly in liberal arts and community colleges as well--these suppositions are grossly unwarranted. Students' interests are mismatched to the available faculty, so that each biology professor may have sixty advisees (mostly pre-med, pre-dent, and pre-vet) while each physics professor has two or three. Virtually any high school graduate can attend a college, and many have no devotion to a field--and many who claim such devotion are misguided; for many, college is the natural extension of high school, a further postponement of adulthood undertaken together with high school friends, almost forced upon them by parents and even their society (notice the strangely inappropriate term "college drop-out", used as if college were part of compulsory public education).

There is no unified purpose, and the faculty comprises several faculties, each responsive to its own imperatives both disciplinary and political, and each with its own idea of what higher education should signify for its students. For many students who reach the third and fourth year committed to a field of study, advisement is an integral part of the process of learning. But new students, and students who turn out to have followed the wrong path, are alienated from the institution. They float nearly freely, bound only by the punishable offenses and uncorrelated lists of required courses in a General Bulletin for whose turgid contents they are, as if in a story by Kafka, held completely responsible. It is these students who need at least one **attachment point** with their university, and the advisor supplies it.

I italicize **attachment point** because of its centrality. The alienated student is not accountable when academic and personal life bleakens. If (say) a recruited football player wants to leave college, he is accountable to the football coach for that decision--he has an attachment point, someone to whom it matters what he does as a student in college. He must make his own decision, of course, but a good coach is there to supply perspective, encourage tranquil contemplation of the consequences, and introduce hitherto unregarded variables. Notice that my hypothetical football coach has the three requisites of a good advisor: he is approachable, he has earned respect for his authority, and he knows what he's doing. If the troubled player has only this one attachment point, at least he has a reliable one.

I cannot consciously set about being like my idealized football coach, but if I am successful as an advisor, it is because somehow I meet the three requirements of approachability, authority, and knowledge. As I reflect on this claim,, I do not think that advising Ph.D. candidates differs much from advising German majors, or advising German majors much from students being dismissed from college, or students who have done badly from new students simply confused and unclear about charting their course at a school where all choices are theirs--including the choice whether to stay or to leave. That is to say, while disciplinary expertise does not translate into general advising competence, my experience suggests that the reverse works well and that general lessons in advisement can be specialized at will.

Being approachable means both being predictably present and being open-minded. I post a schedule for each week, leaving thirty or more blanks for appointments and saying where I plan to be at some other hours--I've done quite a bit of advising in the gym during my workout time. I ask students to be sure to sign up a day early to guarantee that I'll be there, but four hours' notice is usually enough. Some weeks find me very busy, while in others I have fewer office hours than the dean probably expects. I try to find out a student's extra-curricular avocations and am actually interested in them. And I am open about my prejudices, but label them for what they are, prejudgments based on general not specific understanding; I would rather see a student study a primary than a derived subject, biology or chemistry before nutrition. Finally, I manage to find something in the advisement situation which prompts me to inform the student about something I think interesting and maybe useful (as with the example of Schiller in paragraph three). Above all else: I remind students that being in college is a voluntary association, and that our common interest is merely to make it productive. College is but one of many uses to which they could put the years between eighteen and twenty-three, and maybe not the best for them. The increased presence of older-than-traditional students in class illustrates the point that a student can follow another call for a while and later come to college if it then seems wise. Perhaps knowing that I want to help them succeed, but have no desire to badger them into staying, makes me easy to approach.

Authority is after all what students pay their tuition for. Among their family and friends and other attachment points (if they are fortunate enough to have any) can be found many fine souls who will stroke their ruffled feelings. My value to them is that I have advised students, at every level and in many fields, for nearly twenty years on three quite different campuses, for almost six years (at Brown University) even living with hundreds of freshmen with my family as Resident Fellows, and that I can put their predicaments into a real perspective, citing chapter and verse of cases much like their own and the outcome of each. Together we can lay out options and predict the consequences implied by various courses of action, both of us knowing that we are building on a firm foundation of experience and not the shifting sands of supposition and emotionalism. As the association between student and college is voluntary, so the decision to stay or to leave, and--if to stay--what and how to study, is entirely the student's.

Knowledge is best if it comes both actively and passively. The good advisor will know the **General Bulletin** and related documents. The better advisor will have participated in every phase of orientation and registration, and will have been vigilant in serving on committees where decisions affecting students' scholarly life are made. I think that knowing the **Bulletin** is a fair expectation of all professors who advise, even of those who advise only majors in narrow and vocational fields.

But to advise wisely and well the undecided student and the student recently disabused of a major filed chosen for the wrong reasons, and certainly to advise a student facing dismissal, one must know why the **Bulletin** says what it does, how economically to overlap the requirements for competing possible majors, and which courses to balance other courses with to make a healthy diet most promising of success in the coming quarter. It is in meeting this requirement that the humanities-inclined interdisciplinarian has an unfair advantage over other colleagues, since we **do** know the **Bulletin** better and have had to be active on curriculum and academic policy committees simply to protect the ever-threatened "fluff" we hold so dearly.

Even in the early sixties, when I was in college, advisement was not a distinct activity of faculty members or even deans. There were "gentlemen's" majors like English and History (over half of my graduating class claimed these two fields) for those destined by birth or status to careers at law or in business, and other majors for those who pursued higher learning with a professional purpose. If a student proved indecisive about a major, at least the general realm (arts and letters, social science, science and mathematics) could be taken for granted, for those dice were cast in high school for all but a few of us. As remarked above, this situation is but a dim memory, and as students have come to us less programmed towards a field of study, academic advising has emerged as a distinct activity for which the professorate is but poorly prepared. We, after all, were advised **within** our field as a matter of routine, in a way indistinguishable from other faculty-student conversations. We always assumed (many still assume) that "advising" meant "discussing the field with our students."

Now we find many students who very much need advice but who are most certainly **not** our students. A third of entering freshman at my university declare no major at all, and half of those who have declared a major change their minds, many more than once, after a short time in college. Students who leave college after a quarter or a year tend disproportionately to have been undecided or soon rendered undecided. We have responded to this clear failing on our part by assembling and training a cadre of so-called SUM (for "Students Undecided about their Majors") advisors, and early results in cumulative grade point averages and retention are promising.

I, at least, am not surprised that the SUM advisor corps contains all of the faculty who have been active in the humanities program, and many who are contributing to our new campus-wide interdisciplinary Core Curriculum. These are people who appreciate indecision as a point of departure, who know that recognizing that "two roads diverge in a yellow wood" is the first sign of intellectual maturity, and who have a rich store of experience, learning, and anecdote to support a "primitive" approach to academic advising. Not the least tool in their baskets is a strong foundation in the humanities, for advising the undecided student poses the same questions which the humanities have perennially tried to answer: questions about personal decisions, made in ambiguous contexts, requiring that competing values square off. As noted above, the undecided student, **Bulletin** in hand, is in a Kafka-esque situation, like Joseph K enmeshed in a legal web without reference in his own life and yet condemned by it. Our job is--to borrow a central image from Richard Mitchell's exquisite little book on thinking (**The Gift of Fire**, 1987)--to help students take a grasp of their own minds, to empower them to self-direction, and not at all to tell them what to do.

EXPRESSIONS OF THE SELF

The Fall 1988 issue of HUMANITIES EDUCATION will be devoted to the theme of Self-Expression, including such topics as autobiography, self-portraits, self-expression in music, poetry, architecture, crafts-- whatever. This issue will also include selected color slides from the collections of the Minneapolis Institute of Arts with informational notes and ideas for teaching.

As always, articles should relate to interdisciplinary humanities learning. In addition to longer articles (see Editorial Policies on reverse), we like to have relevant reviews, abstracts of journal articles and short pieces describing classroom activities, museum exhibits, favorite documents and artifacts, etc. Selection of articles will be influenced by the need for balance among our many constituencies as well as the usual factors in accepting articles for HUMANITIES EDUCATION. The final deadline for acceptance of completed submissions is May 1, 1988. Send to the Special Issue Guest Editor:

Susan Coultrap-McQuin

BEST TRANSLATIONS

UNTRANSLATABLE? THE POETRY OF STEFAN GEORGE

(Editor's Note: Regrettably, this will be the last of Burton Raffel's series of contributions. See **HumaNews** for news of Dr. Raffel's new endeavors.)

We sometimes say, largely out of habit, that there are some writers--poets in particular--who are forever locked into the one language in which they have made their marks. These writers, we say, do not "travel" well. I confess to having said things of the sort myself, at times--until I informed Haraldo da Campos that Lewis Carroll's "Jabberwock" was one such poem, and he promptly recited an utterly superb, accurate, stirring Portuguese rendering.

The truth is that nothing and no one is untranslatable. Writers who are said not to travel well are writers who have not yet found their translators. They may never find them--but if and when they do, their light will beam across all barriers of language, culture, and time.

The great German poet, Stefan George (1868-1933), worked long and beautifully. He was and still is honored in his native country. But in English he remains, like so many other great names, poets and writers of fiction alike, only a name. It is impossible even to begin to speak of George's virtues, let alone of his accomplishments, when all the English-speaking audience knows of him is stuff like this:

TEMPTER

Our sum is not complete, we lack the thrice,
And would be rendered double with out twice.
So we invoke the four imploringly
From fog, from madness, spook and witchery.

This is not one of George's greatest poems. I have chosen it for its length: more complex material simply cannot be handled in so short a space.

Nevertheless, in German this little poem shows a good deal of what George is all about. He tends to be hermetic, and to write for an intellectual elite. He tends to be didactic. Above all, he tends--and tended throughout his life--to **sing**, to cast a glow of lyrical splendor over almost everything he touches.

856

Verfuehrer
Wir sind nicht voll, wir haben nicht die drei
Und möcht en dopplet sein mit unsrer zwei.
So rufen flehend wir dir vier herbei
Aus nebel wahn und spuk und hexerei.

Without trying to fully translate this little poem--that is, without polishing a translation to the point where it reflects as closely as possible the form as well as the structure and content of the original--one might render at least the gist of the poem as follows:

We're incomplete, unable to get to three.
We tend to be doubled if we try for two.
So what do we do? We scream and beg for four:
Mist and madness and witches' tricks and ghosts.

I have just concocted this latter version. The first rendering is from Stefan George, **Poems**, translated by Carol North Valhope and Ernst Morwitz. And it is not simply bad translation. It is in my judgment so bad that it represents non-translation--and since it is a fairly well-established rule that bad tends to drive out (or away) good, this is all the Stefan George we have available to us. Valhope and Morwitz seem to know German; there can be small doubt that they do not know English--not poetry, which is quite beyond them, but the basic language itself. "We lack the thrice" is sheer gibberish; most of the rest of their "translation" verges on gibberish, too.

Why have they done such dreadful things to George's neat, compressed, delicate lines?

Sin #1: They have assumed that rhyme is all-important.

Sin #2: They have assumed that meter is all-important.

Sin #3 (and probably most basic of all): They have assumed that one needs only to understand **words** in order to translate poems.

Sin #4: They have assumed that poetry occurs when one arranges lines in apparently poetic order. That is, labelling something poetry, in their judgment, makes it poetry.

Sin #5: They have assumed that no one actually **reads** translations, as one would read poetry in English. One **studies** them. Or collects them. Or--I do not know what.

Stephan George is translatable. He is worth translating. In the meantime, we must keep our students from ever seeing the work of so-called translators like Valhope and Morwitz. It is better never to mention Stefan George's--or any other "untranslatable" writer's--name than to present students with trashy blasphemy.

HUMANITIES EDUCATION
ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

HOW HI THE FI

Artspectrum, a two hour sampler videotape of **The Roland Collection** of art and art history films. $29. The Roland Collection, 3120 Pawtucket Road, Northbrook, Il 60062. Review essay by Fred Schroeder.

Educational films about the fine arts are abundant, but finding them is often a matter of serendipity. Purchase prices are high, and rentals are somewhat inconvenient. The Roland Collection addresses these problems quite effectively. Filmmaker and art authority Anthony Roland surveyed some 6000 films worldwide and has brought together over 200 titles on arts and culture. All are available for 16mm film sale (ranging from $200 to $700), rental ($20-$70 plus $7 handling), and nearly all are available on video (either VHS or Beta) at a purchase price of $70 - $100. Tapes range in length from nine minutes to 38 minutes. This review, however, refers to a two-hour sampler videotape of 65 films, with 1 1/2-2 minute segments of each.

Needless to say, it is a frustrating experience to view **Artspectrum**, and it is almost impossible to make a generalization about the Roland Collection. Some tapes are a visual exploration of a single work: **Ecce Homo** examines a Bohemian Gothic woodcarving; some play among a variety of drawings by a single artist: **Delacroix** and **Turner** are two; some incorporate documentary film clips: **Kathe Kollwitz** places her poignant studies into the context of depression, oppression and war; some use sound as innovative expression: **A Homage to Steinlen** accompanies close-ups of pen drawings with evocative sound effects of dogs barking and thunder rolling, **Royal Rococo** accompanies a visual tour of an Eighteenth Century palace with lively and sonorous Baroque music; at least one film turns a painting into a story: **Antoine Watteau: The Melancholia of Pleasure** tells of the love and loss of a harlequin; some are environmental: such archaeological tapes as **The Origins of Art in France**; and some cover periods of art history: the dozen from **The National Gallery: A Private View** series are excellent. Of the three or four extracts from this series on the **Artspectrum** sampler, **The Northern Renaissance** for example, studies vanEyck's **Arnolfini Wedding** in detail, explaining the symbolism clearly and efficiently, moving from detail to detail as does the sophisticated eye looking at the original painting. Or does it? Seeing the original in London is to be surprised at how small the painting is, and most certainly, it is also to learn that there is neither leisure nor easy access to permit the close study of the artist's signature or the oranges on the window sill. Which presents a number of conundrums facing anyone reviewing a videotape for use in the humanities classroom:

First: what is the ideal way to experience art?

Second: is motion picture appropriate to viewing static art?

Third: is videotape acceptable?

Anyone who has visited the Louvre on a crowded summer Sunday afternoon is likely to agree that viewing the **Mona Lisa** first hand may not always be the ideal way to contemplate or study this masterpiece. Nevertheless, for the aesthetic experience it is probably true that the immediate object is to be preferred over any mediation. The best situation is to have one's own collection of original masterworks. Second best is to visit a museum collection at leisure. Third best (possibly) is to visit the original in a group with a tour guide or teacher as mediator.

So much for the real thing. In practical terms, as art consumers and as humanities teachers, most of the arts must be experienced by way of reproductions. The greatest technical challenge to reproduction is in color paintings. From 1880 to about 1935 numerous advances were made in color printing from photographs, but with the introduction of Kodachrome in 1935 it became possible to project sharply detailed reproductions with only the subtlest departures from "true" color. In book illustrations, the publication of Thomas Craven's **Art Masterpieces** in 1939 marks the point after which dull-hued, faulty-registered reproductions became unacceptable, and in humanities textbooks such as Fleming's **Arts and Ideas** and Lammi's **The Search for Personal Freedom** the quality has risen with each new edition over the past two decades.

For many humanities teachers, however, the processes are combined in homemade slides copied from art books. In short, we **are** willing to compromise on quality--for a price.

The use of motion pictures for experiencing art second hand is hardly a question for architecture, urban arts, gardens and monumental sites. The "real" experiences are spatial and temporal, not static; neither slides nor books can adequately convey the **unfolding** of Versailles or Venice, Karnak or King's College Chapel. Furthermore, there are other limitations to direct experiences. The Roland Collection's **Michelangelo**, for instance, takes the viewer deeper into the Sistine Chapel by way of telephoto lens and adequate lighting than was the privilege of any Pope after Michelangelo's scaffolding was removed.

And there are other legitimacies for motion picture reproductions. Dance, for example, as in Roland's **Man and Mask: Oskar Schlemmer and the Bauhaus Stage** (a film which I have used **gratis** by way of the German Embassy for years, and which I heartily endorse). Or African arts, which in many respects are incomprehensible out of social context. **The Shape of Darkness**, unfortunately titled and unfortunately in black-and-white, is yet a superb rendition of (among other things) the Senufo's magnificent masks in their relationship to dance and ritual.

The catch, of course, is the filmmaking team. If it is dominated by art historians, noted for hedging and irrelevancy, you simply "ain't got no movie"; but dominated by cinema graduates, you must put up with frenzied cameramen, koo-koo zooms, bongo drums and electronic beeps and bleeps to make the "art alive." The danger is compounded when the topic is a painting or drawing. Some directors simply can't let sleeping masterpieces lie, but feel obliged to set staccato cutting of details to staccato music (as often as not from an inappropriate time-period). This fault appears to afflict some films in the Roland Collection, but in most cases cinematic style and sensitive directing help the viewer to linger thoughtfully over significant details, moving from point to point in a rational (or at least **dramatic**) progression, as referred to in the examples of Delacroix, Turner, Steinlen and in individual segments of the National Gallery's "private tours." In brief, used well, there may be no more effective way to train a student's eye to look perceptively and to see thoughtfully than to follow the enlarged vision of a camera exploring a single work of art.

What about conversion to video? Viewing **Artspectrum** in my home, it is clear that the compromises in quality the viewer must accept are profound. There is neither white nor black on the video spectrum, reds tend toward magenta, greens render as Astroturf or mud, and there is no such thing as a line or edge. All is electronic pointillism. On the other side, some of the advantages of film mentioned above remain (motion, close-up, spatial expression and interpretation), although color fidelity, sharpness of image and screen size are sacrificed. However, all but the most dedicated cinema buffs make these sacrifices willingly to bring feature films into their homes, so why not art? Video is low-priced, much more portable and convenient than film, usable by students without supervision, easy to re-run and review and adaptable to spacer from carrels to medium-sized lecture rooms.

The conclusion is obvious to the point of being platitudinous. Art videotapes should be selected by previewing, not be title. They should be used judiciously, but particularly where slides, prints and books are inferior (as in dance, architectural and environmental subjects). They should be introduced, supplemented, augmented or contrasted with slides, prints, books--or the real thing. And the instructor should think carefully about the interpretations, whether explicit or implicit. Is the narration compatible with the dogma of **your** course? If not, does it present a valuable alternative view? Will it require reteaching or criticism that is not a waste of time?

Notwithstanding all these cautions, the Roland Collection provides an important service to humanities teachers. Intellectually, aesthetically and critically these appear to be selections from the very best arts and culture films available. In video format, they are economical and convenient; in 16mm film,
I'm sure, visual quality is equal to static 35mm slides. The **Artspectrum** tape may be useful, but you should start by requesting the publisher's brochure.

AIDS TO ARTS

"AIDS, The Creative Response" by David Kaufman in **Horizon**, November 1987. $4@ newsstands.

The arts exist within the same social, economic and political environment as their contemporaries, but often--we might even say usually--the arts reflect the public environment obliquely rather than directly. This seems to be especially true in regard to public crises; the twenty-year "lag" in artistic examination of the Viet Nam War is a frequent case in point, as is World War II. A lot has to do with definition of art, but, Kaufman, a New York critic, does not include the journalistic and popular arts which respond quickly in photography and song. Art as commercial galleries, Lincoln Center, Broadway and New York critics, though, does seem to be guilty of tardy reflections upon the current scene.

This is not the case with the AIDS epidemic, most probably because so many artists have had close friends who have been AIDS victims. (All hasten to correct the unjust popular identification of artists with AIDS; male homosexuals and drug addicts are the prime victims but not to the exclusion of the more general population.) There is another reason, however, that the arts are impelled to comment upon this plague, for the disease is enigmatic. Causes, transmission, cures are uncertain. The course of the disease is related to intensely private behaviors. The largest groups of victims are not viewed sympathetically by the majority population. Diagnosis often implies public exposure of non-traditional life styles. Public hysteria is part of the epidemic. And, unlike many diseases, AIDS can deliver a death sentence without impairing the creative forces. Quite the contrary.

Poet Paul Monette, who figures his days as numbered, has a collection of eighteen elegies forthcoming on the death of his beloved Roger, and he is working on a book about the last months of Roger's life. Choreographer-dancer Arnie Zane, who has been diagnosed as having AIDS has with the help of his company produced **The Gift: No God Logic**, which in abstract form shows four people trying to cope and do good in a world of no logic. Robert Gordy, a New Orleans painter who died of AIDS in 1986 produced in his last year "an expressionistic series of mono-prints about very angry and tormented men." The intensity of feeling can be a problem for the AIDS-inspired artist. Kenneth Lithgow's paintings of life-size figures whose skulls and internal parts are visible through a tissue of personality are arresting, gruesome, pitiful, yet Lithgow fears they will die in his studio: "Who would want to live with them?"

The most directly human of the arts is theatre because through dialogue it can explore the personal and social complexities of a disease that has shattered so many human relationships and has brought so many others out into the open. Kaufman discusses several, but Harvey Fierstein's one-act **Safe Sex** is especially telling: two male lovers, perched on a see-saw, find that to maintain their relationship they must maintain a balanced distance. This, and many other instances show the importance of art as expression in times of crisis and confusion. "Art's mission," Kaufman says, "has always been perceived as the need to articulate what cannot be articulated, to share experiences and values through catharsis and metaphor for the sake of understanding the mystery that cannot be understood."

ILLUMINATING MUSICK

"Medieval art and the performance of Medieval music" by Richard Pestell in **Early Music**, February 1987. Oxford University Press, OX26DP England. $40/yr, $12/issue.

Many a music lover was introduced to the Baroque by way of Stokowski's schmaltzy transcriptions and to Renaissance music by way of Resphighi. Almost nothing like these exists for music of the Middle Ages, especially in an era marked by academic authenticity as the primary aesthetic. Medieval music is spare, austere, puritan, at least as we hear it today.

Is austerity really authentic? Very likely not, says Pestell, an English architectural historian with a doctorate in biochemistry; that is, if musicologists would take an interdisciplinary view of the fabric of medieval arts. First of all, there is a very thin supply of documentary evidence about music (and other arts) criticism of the middle ages, and what there is is widely scattered over both time and geography. In addition, many of the statements are puritanistic polemics against prevailing practices. If, for example, we were to believe that the words of Bernard of Clairvaux described authentic medieval architecture, we would have to raze all the surviving cathedrals as unrepresentative. In matters of building, fortunately, we not only have visual documents, but the opposing opinions of the Abbot Suger. Decoration in the arts was a debated question, not a settled dogma.

It was also a question of resources. The richer the parish or diocese, the richer the decor, and Pestell believes that this would apply to instrumentation in musical performances. Moreover, few of us have an inkling of how little of the architectural ornamentation still exists. Statues were painted in brilliant basic colors, doorways were gilded, columns were painted in imitations of marble, banners were hung in nave and aisles and most stained glass windows were more jewel-like than their replacements of the past couple centuries. If we can assume an aesthetic sense that spans the arts of an era, we might look at illuminated psalters and liturgical paraphernalia as indications of what authentic music might have been. (St. Bernard didn't like these, either.)

Finally, the liturgy itself became increasingly dramatic and expressive over the centuries. An instance of the Easter Passion story (drawn from studies by O. B. Hardison) shows not only theatricality, but a wide array of alternative interpretations of characters in the drama. Theatre was condemned by the church more because of the riotous audiences than the imitative art itself. So, Pestell concludes, "The use of instruments in the performance of medieval church music is entirely consonant with what is known of medieval sensibility."

SOAP STUDY

"The Next Episode: Soap Operas as a Bridge to Improved Verbal Skills" by Robert F. Moss in **English Journal**, January 1987. National Council of Teachers of English 1111 Kenyon Road, Urbana, IL 61801. $35/year, $4/issue.

If you haven't watched the soaps in recent years, there will be some surprises. For one thing, the pace is no longer that of a glacier during a cold snap. Also, from time to time they sport with foreign intrigue, the occult and science fiction. The largest difference, though, may be in the audience, which has expanded to high school and college students, including many of Moss' remedial English students at Hunter College. The attrition rate for these young men and women, mostly black and Hispanic from disadvantaged homes, is lamentably high, and anything that will make them better critical thinkers and, consequently, more sophisticated writers is all to the good.

The soaps are one vehicle.

Moss recommends a program of graduated writing topics beginning with which characters the student likes least/most and why. The results are generally naive endorsements of conventional morals and values of white middle-class protestantism with a California-style fillip. The students like "courage, honesty, charity, compassion and family loyalty" and abhor self-interested betrayal, tyranny, treachery and cruelty.

En passant Moss teaches much about the soap opera industry. Good/Bad dichotomies are required of the authors of soaps, for example. The next problem is to judge actors; students generally cannot conceive of actors as actors--they **are** the characters. Moss helps students to examine such questions as the credibility of emotions and the difficulty in portraying a character. Next is structure: The pertinent questions are how many running plots does the average soap include at any given time, how many story segments are devoted to each story line per day and per week, and are stories given equal emphasis or are some more prominent than others? The industry requirements, of course, include contract obligations for the regular appearances of actors as well as for the expenses of location shooting, staging fights, using special effects--all of which are departures from the usual low-budget strictures of limited casts, five per week production, studio sets and soap opera conventions. A character may disappear because of an actor's vacation; a community may be immune to a stockmarket crash or an earthquake because soap opera conventions don't consider headlines.

Which brings up the reality of this realistic medium. Where is the news? Where are the swearwords? Where are the churches? The priests? The Big Macs? The chewing gum? The current movies? The other TV shows? Why doesn't anyone smoke?

And why are there so few--or **any** blacks in soap-operasville? Why doesn't anyone really go to school or put in forty hours a week on a job? Why do people swap partners so often? (Because they are on contract.) Soaps manage to exploit the pop tops in medicine and psychology today, but, as a **Newsweek** writer said, "that's so much icing on the cake."

UNITY IN CREED

The Humanities and the American Promise: Report of the Colloquium on Humanities & the American People by Merrill Peterson. Texas Committee for the Humanities, 1604 Nueces, Austin, TX 78701

There's a lot to underline in this thirty-seven page essay, another in the series of NEH-supported reports that should be setting a new standard for governmental communications. William Bennett's **To Reclaim a Legacy** examined humanities in colleges and universities, Lynn Cheney's **American Memory**, humanities in the public schools, and this, humanities in American public life. As with the previous reports, it summarizes the findings of a think-tank group in the style of an individual author, in this case a University of Virginia professor who is an authority on the works of Thomas Jefferson. The funding was from the Division of State Programs which is mandated by Congress to receive no less than 20% of NEH appropriations. The central NEH has a Division for public programming, but as all readers of **Humanities Education** must know, the state-based councils have taken on as their main task public humanities for adult out-of-school populations. This report, however, casts a wider net than NEH agencies.

Because readers will want to do their own underlining, this abstract primarily gives the structure of the report. The Introduction provides clear and comprehensive defining characteristics of the humanities that humanities teachers may find useful to have at hand when definitions are called for. The first fifteen pages might serve as a model for the American studies approach; with the thesis statement that " a distinctive humanist tradition arose in America," Peterson first discusses our American **unity in creed**, the unique traditions of public statements of ideals of freedom, equality and self-government that are accepted by all regardless of how incompletely the ideals are realized. After this, the essay explores the paradox of **democratic culture** which includes the Whitmanesque artistic tradition, the ideal of public school education and the tensions of popular culture, at once refreshingly lively and crassly exploitative.

Within this culture, the humanities "have never been self- justifying to the American people," so it is necessary to explain the **uses of the humanities** to ourselves. The essay briefly describes what mental skills are fostered by each of the humanistic disciplines, suggesting as well their uses in public life, and then explains the newer concept of applied humanities.

The second major section, "The Humanities in University and Society" acknowledges that there are several "humanities communities" such as schools, colleges, museums and voluntary associations as well as universities, which Peterson regards as the proper lair of the professional humanist. The descriptive analysis of the American university notes both its resistance to change and its tradition of advanced inquiry. The general democratization of American universities, however, has forced them to become responsive to the interests and needs of the world

874

outside the academy. The outside pressures on the humanities, specifically, have taken three forms: to become more "scientifically" objective in methods, to preserve a hallowed intellectual tradition, and to become more vocationally oriented. The ramifications of each, for better and for worse are discussed.

Outside the university, there are many humanities communities. A statement to underline describes these most generously: "Wherever human beings remember, think, interpret, analyze; wherever they deal seriously with each other's conduct, wherever they try to understand life's meaning...there we see the fundamentally human impulse from which the humanities spring, but, like most things...the humanities are improved by art...." With this concept in mind, the essay looks into the patterns of humanities programs for the public that grow from the two well springs of the academies and society.

The essay closes with ten recommendations, briefly condensed here: 1. Improve the quality of civic discourse. 2. Examine public issues in all their complexity. 3. Strengthen humanities education of school teachers. 4. Encourage multidisciplinary activities in colleges and universities. 5. Take the initiative in colleges and universities for public humanities education as an ongoing commitment. 6. Advance cultural literacy without insisting on canons and lists. 7. In state councils, allow for non-academic generation of ideas and projects. 8. Be receptive to new movements, but criticize where these deaden rather than quicken thought. 9. Encourage new roles for humanists in the public arena. 10. Encourage research on issues critical to the humanities such as cultural literacy, popular culture, new technologies.

This is indeed an essay for every humanities educator to have at hand and in mind.

CREATIVE CONFLICT

"Community, Conflict, and Ways of Knowing" by Parker J. Palmer in **Change** 19:5 (September-October 1987). $20/yr, $3.50/copy. 4000 Albemarle St. NW, Washington, DC 20016

The sand table committee, the mural committee, the playwriting committee are strangely memorable spots in the learning history of those of us who attended progressive elementary schools half a century ago. Such intense indoctrination in collaborative learning is rare in public schools today, but even in the Thirties and Forties, the value placed on collaborative learning communities deteriorated as the student ascended the academic ladder. By the college years, competitive individualism was the watchword. Moreover, competitive individualism becomes a life ethic, one that has been a major contributor to "the collapse of civic virtue in the society around us" according to Palmer, who directs the Resident Program at St. Benedict Center in Wisconsin.

Higher education should become an agent for change as a model for community, both in advanced sandtables for the classroom and dorms, and in integrated curricula. The words come easily, but, Palmer says, the reforms cannot be superficial because both causes and remedies strike at the very heart of the mission of higher education - "the generation and transmission of knowledge."

Three rather abstract words describe the epistemology or grounds of method in collegiate learning: **objectivism**, whereby we distance ourselves deliberately from the things we wish to know; **analytic**, whereby we dissect the objectified things as a way of knowing; and **experimental**, by which Palmer means the manipulation of the dissected objectified fragments to suit our purposes. These "bloodless" words quickly become an ethic, not only a **way** to comprehend the world, but the **right** and only way to view the world, which is rendered as a fragmented collection over which we exert power by means of denying our relatedness to it.

Relatedness is a keyword for Palmer's idea of community for he means "relatedness not only to people but to events in history, to nature, to the world of ideas, and yes, to things of the spirit." How to foster relatedness as the basic way of knowing? Not by "add-a-course," which is simply one more instance of dissected experimental manipulation. There are areas of study that Palmer thinks are introducing new epistemologies of "the **relational** nature of reality," such as feminist, black, native American and ecological studies. While still employing analytical methods, these maintain a "way of intimacy, the way of implicating yourself in the subject."

But to get this down to the ground-level of classroom practice we must learn to foster **creative conflict**. Learning communities must habitually challenge, revise and refine, not for individual competitiveness, but as a way of knowing. The great barrier to creative conflict is fear--of exposed ignorance, of ridicule, of graded judgement--; the antidote for fear is love, of two kinds, love of learning and love of learners.

TRAGIC PUZZLES

"Aeschylus: Playwright Educator" by Robert H. Beck in **Educational Theory** Winter 1987. Education Building, University of Illinois, 1310 S. Sixth St., Champaign, IL 61820. #20/yr.

Homeric morality with a twist is what the ancient Greek playwright Aeschylus offered in the adult education program of the Athenian drama contests. The leaders of the city-state continued to underwrite productions of these moral lessons long after Aeschylus was dead and even passed a law that any private underwriter of a Aeschylian drama was guaranteed a place in the competition.

The Homeric lesson is simple: there is retribution for moral faults; wrongdoing is punished. Aeschylus does not depart from this severe and unequivocal code. Audiences would leave his dramas as did the listeners to recitations of the Homeric epics, not sated with an entertainment but thoughtfully pondering upon the meaning of the lesson as it had been exemplified by the characters of the narrative or the plays. The difference in Aeschylus (who may or may not have been predated by earlier now-lost dramatists) is that he injected greater realism into his characters, allowing "even those who had committed the worst crimes to claim provocation or other reasons why they may have transgressed." The Homeric code holds fast, but for us to try to act in accordance with it is not an easy endeavor. We may, like Agamemnon, do wrong, but for plausible reasons which understandably provoke us, though they do not justify the wrongdoing. What's wrong is wrong.

Aeschylus "dramatizes puzzles," says Beck, who is a classicist at the University of Minnesota, and there in lies the appeal to more general audiences. Because of the puzzle formats, audiences are drawn into the moral lesson in all its complexity. Here is the modern educational parallel that Beck ascribed to Aeschylus--public and private morality is taught not by dogmatic rules, but by helping the learners to internalize ideas of right behavior by means of involvement in the process of making moral decisions.

Beck provides analyses of a number of dramas, stressing that examination of single plays may distort the real structures of trilogies, in which the final play shows reconciliation to the morality of fate, as in **The Oresteia**, the only surviving complete trilogy of "moral rhythm."

ODD COUPLE

"Information Science and the Humanities: the Odd Couple" by Margaret F. Stieg in **Library Journal** October 1, 1987. 249 West 17th Street, New York 10011. $67/year.

Information science investigates the properties of information, how information behaves, how it flows and is used. Information science also studies the best techniques for storing, retrieving and disseminating information. Concerned with both theory and practice, this is an interdisciplinary science, for **information** knows no boundaries.

True enough, says Stieg who teaches in the Graduate School of Library Service at the University of Alabama; information may not have boundaries, but people do. And in taking on the name **information science**, this field of endeavor has declared its allegiance to one side of the boundary between "The Two Cultures" of sciences and humanities. The division of these two cultures of the academy was propounded in the late Fifties by scientist-novelist C. P. Snow. There is some validity to the idea, but, Stieg maintains, the division into two cultures is social and political and "ignores the whole question of intellectual relationships." Especially for librarians, the front-line practitioners of information science, the distinctions among the ways different disciplines generate, store and use information are more or less minute variations on a common theme. We all value accumulated knowledge, try to discover general truths and attempt to discern patterns that may be useful to humanity. Still, there are differences.

The humanities--a humanistic education--"encourages the individual to develop a personal code of values and standards." Is such a point of view, with its component parts of cultural sensitivity, appreciation of excellence, critical attitude and awareness of ethical implications - is the humanities viewpoint of value to information science? It is, if the right questions are asked. For example, **why?** Information science may ultimately improve the creation of new information. What ends are we serving by this activity? The organization, storage and dissemination of information implies **control** of information. For whom? What are the limits of control?

What is information? What is worth preserving? Is all information equal? What information is dispensable? What might we anticipate as useful information for future generations? Are narrow specialists the best guardians of information? As to the last question, Stieg answers **no.** "Ultimately," she says, "knowledge is an integrated whole and we need to avoid the unfortunate lack of communication and interaction that invariably follow compartmentalization." The information scientist must be "an integrated individual."

TRUE PLACES

"Cultivating an urban Aesthetic" by Arnold Berleant in **Diogenes**, Winter 1986. Nuova Italia Editrici, Casella Postale 183, 50100 Florence, Italy. 40,000 lira/year.

Although "the city" is not an explicit theme for many humanities courses, its importance is implied as a factor in almost every one of the Golden Ages of humanities and arts. That a city can have aesthetic characteristics is undeniable, yet of all aesthetic objects the city is unique in being a full participatory experience, a "theatre without spectators," as Berleant, who teaches at Long Island University puts it. Like a natural landscape, the city is both a human perception and a human projection, but unlike the natural landscape, the city is the "creation of people" whose human-made structures obscure all but the grossest natural features of hills, rivers and harbors.

Prior to the industrial age, cities, like villages and towns, developed at a slow pace; "what was unsuitable was eliminated by attrition of long deliberation or of the vicissitudes of weather and climate, and what proved itself...endures." In these environments the people belong to the city, or exist in a symbiotic unity of person and place, of present and past. This is the ideal that we strive to **cultivate.** Attempts have been made to restore the unity, but there are few successes, and probably none that are comprehensive. The engineering mentality has dominated most twentieth-century American urban planning with almost total lack of success. All problems are not technical, all answers are not technological. Urban problems are human problems, and at any point, they are at a stage of historical evolution of human experiences. The historic preservation movement which has largely replaced the engineer's slash-and-burn technology certainly takes cognizance of the need for continuity and tradition in the perceptual experience of the city, but, at its most extreme, it produces "lifeless museums by a kind of architectural taxidermy" as in Colonial Williamsburg and its imitators. Preserving outward features alone does not recognize the totality of the perceptual experience.

For the key to understanding the urban aesthetic is sensory awareness, but of a very special kind, because of all the art forms the city includes smells and tastes along with the more usual aesthetic sensations, and more, because we experience the city as a kinesthetic continuum in which we also interact dynamically with other people who are also perceiving, acting and reacting. Berleant has no formula for successful cultivation of the urban aesthetic, but he does distinguish between **false environments** and **true places**. Unfortunately--or fortunately--people are resilient and can endure false environments such as shopping malls, luxury high-rises and sterile urban plazas, but observing these may help us "to see, in contrast, what a humane environment would be like...[where]...the environment does not lie around us but is continuous and integrated with us."

HUMANITIES EDUCATION

HumaNews

Official Newsletter of the National Association for Humanities Education

Edited by Darrell Bourque & Vaughn Baker, University of Southwestern Louisiana, Lafayette, LA 70504-4691.

EDITOR'S NOTE: Member-subscribers are invited to submit personal newsbriefs about their activities, publications, awards. We will be pleased to print announcements of upcoming conferences, calls for papers, fellowship and seminar opportunities relating to humanities and arts education. Such announcements should be submitted at least three months in advance of events or deadlines to ensure properly timed publicity.

NATIONAL ASSOCIATION FOR HUMANITIES EDUCATION: BOARD OF DIRECTORS

President

Fred E.H. Schroeder
Institute for Interdisciplinary Studies
ABAH 405
University of Minnesota Duluth
Duluth, MN 55812-2496

Vice-President/President-Elect

Sharon Scholl
Professor of Humanities
Jacksonville University
Jacksonville, FL 322211

Past President

Vasant Merchant
436 North Evergreen Drive
Flagstaff, AZ 86011

National Board of Directors Members-at-Large

Gary D. D'Lamater
Director, AMP Institute
AMP Incorporated
Harrisburg, PA 17105

Bryan Lindsay
Professor of Humanities
University of South
Carolina Spartanburg
Spartanburg, SC 29303

James V. Mehl
Professor of Humanities
Missouri Western State College
4525 Downs Drive
Saint Joseph, MO 64507-2294

Marion Jackson
Associate Dean, School of Art
University of Michigan
Ann Arbor, MI 48109

Ron Maggiano
University of San Diego
High School
5961 Linda Vista Road
San Diego, CA 92110

David Stringer, Head
Humanities Department
Huron High School
Ann Arbor, MI 48104

Inez Wolins
287 Seventh Avenue
Brooklyn, NY 11215

NOTE: Send all news items, announcements, and brief comments to Darrell Bourque and Vaughn Baker, Editors **HumaNews**. Drawer 4s4691, University of Southwestern Louisiana, Lafayette, LA 70504-4691.

NAHE ELECTION RESULTS

The response of members to the election was very good, indicating both high interest in the Association and the high quality of all the candidates. President-elect/Vice-president for the next two years will be Sharon Scholl.

Because of a tie vote, three At-Large Members of the National Board of Directors will be seated. They are Mame Jackson, Ron Maggiano and James Mehl.

Scholl teaches Humanities in the interdisciplinary studies program at Jacksonville University in Jacksonville, Florida. Jackson is Associate Dean of the School of Art at University of Michigan, Ann Arbor. Maggiano is a history-humanities teacher, chair of the Social Studies Department, and a poet from University of San Diego High School. Mehl, Missouri Western State College, is presently serving as chair of the 1989 national conference in Kansas City. David Stringer, Humanities Department Chair at Huron High School in Ann Arbor, will also continue as an At-large Member of the Board of Directors.

President Fred Schroeder expressed his thanks to all the candidates, as well as to the members who voted on the September ballot. He also remarked that the roster of Board members does fairly well in representing NAHE membership geographically and institutionally. "But," he says, "our interdisciplinary membership is so varied we'd need to have twenty or more members to come close to true representation." One of the early tasks for the Board is to revise and streamline the NAHE Constitution and Bylaws.

1989 NAHE CONFERENCE

James Mehl is now calling for proposals for papers, panels, workshops, presentations and other activities appropriate for the 1989 NAHE Conference scheduled for April 20-22 in Kansas City, Missouri. The theme will be "Teaching the Humanities." It's not too early to begin working on presentations and getting a delegation from your area to the meeting. Inquiries and proposals should be sent to James Mehl, Program Director, Department of Humanities, Missouri Western State College, St. Joseph, MO 64507. **Deadline** for proposals is **September 1, 1988.**

NEWS ABOUT MEMBERS

All members of NAHE will miss BURTON RAFFEL's informative and urbane essays on "Best Translations in the Humanities." Burton has left the academic world for the world of philanthropy. He will be the administrator for a new foundation headquartered near Lake Placid. "It's a bit of a homecoming," he says, because before joining the academic world, Burton was the founder and first editor of **Foundation News.**

President FRED SCHROEDER served as a consultant to the Snowbird Institute of Utah, along with NAHE member DELMONT OSWALD, who heads the Utah Endowment for the Humanities. Snowbird, a ski resort, has had an Institute for Arts for several years and is exploring possible expansion into Humanities. NAHE Board-member INEZ WOLINS is deep in dissertation-writing, but continues to work as an educational consultant to several NYC area museums as well as teaching museum education in a NY college. Long-time member BARBARA RESPESS has added to her humanities teaching responsibilities at Benjamin Mays High School in Atlanta the job of editing a monthly newssheet of the lively enrichment activities in her school.

SHARON SCHOLL presented a session at the Association for General Studies in Cincinnati on "selling" the humanities to students who do not wish to buy. She has also been to Jamaica to attend a meeting of an interdenominational church association created to support agriculture, medical clinics, and vocational education. She became involved in the program as a result of teaching in the Contemporary World Studies Program (the humanities portion of courses in Africa, Middle East, and Far East).

MAME JACKSON, long active in field research among the Canadian Inuit (Eskimos), and Judith Nasley are the organizers of the first comprehensive survey exhibition of contemporary Inuit drawings. Jackson and Nasley also published a book to accompany the exhibit which opened in December in Guelph, Ontario and which will go to Ann Arbor Michigan (U. of M. Museum of Art), Manitoba (Winnipeg Art Gallery), Yellowknife, Northwest Territories (Prince of Wales Northern Heritage Centre), Halifax (Mount St. Vincent University), and Ottawa (National Gallery of Canada) where it will close in April 1989.

INSTITUTES, WORKSHOPS, PAPERS, ETC.:

Aristotle for the Non-Specialist, a six-week institute introducing Aristotle's works to 25 college faculty members who teach some of his writings but who are not themselves expert in his thought as a whole. The institute runs from July 5 to August 12. For application form send name, address, academic or professional affiliation to Professor Eugene Garver, McNeely Chair in Thinking, St. John's University, Collegeville, Minnesota, 56321. St. John's is about 80 miles northwest of Minneapolis-St. Paul.

The theme of the ninth annual **Lowell Conference on Industrial History** (Lowell, Massachusetts) is "People at Work." The conference is seeking a wide range of proposals addressing such issues as changing work processes and perceptions, social relations impacted by work, relationships of gender and ethnicity to work, the impact of technology on work, etc. Proposals can deal with subjects in American, European, or Non-Western history as well as address contemporary public policy issues. The conference, scheduled for Fall, 1988, will accept applications for assistance from individuals without institutional affiliation or whose institutions cannot fund travel costs. Proposals deadline is March 31. Mail proposals and assistance applications (with estimated travel cost) to Edward J. Pershey, Paul E. Tsongas Industrial History Center, Boott Mill #8, Foot of John St., Lowell, MA 01852 (tele.: 617/459-2237).

The **Seventh Annual Meeting of the Group for Research into the Institutionalization and Professionalization of Literary Studies (GRIP)** will focus on "Disciplinarity: Formations, Rhetorics, Histories." The meeting will be on April 20-23, **1989**. Inquiries are welcome. Papers must be submitted by October 15, 1988 to David Shumway, Department of English, Carnegie-Mellon University, Pittsburgh, PA 15213 (tele: 412/268-2850).

The University of California Humanities Research Institute provides a continuing series of conferences and seminars addressing themes at the forefront of current dialogue in the humanities. Research themes are developed from major area of humanistic concern: **Area Studies** (western, eastern, third world, dominant and minority cultures), **Historical Studies** (retrieval of texts and contexts in major periods), **Discourse Studies** (the languages of the arts, humanities, and the sciences), **Humanities Beyond Its Boundaries** (humanistic concerns in medicine, law, business, science, etc.) On March 10-11, 1988: Thomas Mann Symposium; on April 8-10, 1988: Annotation and Its Texts (both at UC Irvine). Future conferences now being planned include Biomedical Ethics, Legal History (UCSD), Cultural Interactions: Japan and the U.S., and Women and the French Revolution (UCLA). Nominations and applications will be accepted anytime. As the primary focus of the Institute is on collaborative research, the initial response to proposals usually will be to conduct a conference on the proposed topic on the campus of the proposing faculty or at the Institute. For information write or call University of California, Humanities Research Institute, 307 Administration, Irvine, CA 92717 (tele: 714/856-8180).

INTERFACE '88. The Department of Humanities and Social Sciences of Southern College of Technology is sponsoring, together with the Humanities and Technology Association, the 12th annual conference on the interface of the humanities and technology. Papers, panels, and presentations examining the interaction of humanistic concerns and technological development with the disciplines of, for example, art, music, literature, history, political science, law, architecture, physics, medicine, etc. Conference dates: October 20, 1988, deadline for abstracts: May 1, 1988. Send inquiries to Rex Recoulley or Susan Morrow, Department of Humanities and Social Sciences, Southern College of Technology, Marietta, GA 30060, (tele.: 404/424-7202).

Culture and Society in Victorian Britain, Yale Center for British Art, a summer institute supported by a grant from NEH. The aim of the 4 week institute is to provide university teachers in several humanist disciplines with an opportunity to carry out a program of cooperative research within the context of Yale's unparalleled collections on the Victorian Period. Limited to 25 participants. Each will receive $2,500 to defray housing and transportation costs. Home institutions are expected to contribute $250 toward the cost of the Institute. Mail typed applications (plus three copies) to Director, Yale Center for British Art, P.O. Box 2120 Yale Station, New Haven, Connecticut 06520 to arrive by March 1, 1988. Include name, address, telephone number; curriculum vitae; list of courses that you currently teach as well as those planned for the 1988-89 academic year; two letters of recommendation and one letter of institutional support; brief outline of objectives (not to exceed two pages: what you hope to contribute and plan to gain from participation); an indication of participation in other recent NEH-sponsored projects.

The South Central Modern Language Association has issued a call for papers for a conference on INTERDISCIPLINARY STUDIES IN THE HUMANITIES scheduled for October 27-29, 1988 at the Sheraton Hotel in Arlington, Texas. Submissions on all aspects of interdisciplinary studies --both practical and theoretical--are solicited. Papers focusing on the philosophical and/or theoretical assumptions of interdisciplinary studies are encouraged. Papers should be from six to eight pages in length (ten to fifteen minutes reading time). All presenters must be members of the SCMLA. Sends papers and 100-word abstracts to Keith C. Odom, Department of English, Texas Christian University, Box 32872, Fort Worth, Texas 76129. Deadline: March 15, 1988.

TENURE-TRACK POSITION/ASSISTANT PROFESSOR IN PERFORMANCE STUDIES/NORTHWESTERN UNIVERSITY. The position begins Fall 1988. Applicants should have the Ph.D. and expertise in the area of performance theory. Candidates whose doctorate is in the field of Performance Studies, Anthropology, English, Theatre, or Folklore will be reviewed. Applicants should be capable of teaching performance-based courses such as courses in performance of literature, in culture and ethnographic approaches to performance, in literary and performance theory and in presentational aesthetics. N.U. has recently been funded by the Ford Foundation to develop an undergraduate program in the integrated arts. Applications should be in by March 15, 1988. Send vita, letter of application, three letters of recommendation and a sample of scholarship to Professor Carol Simpson Stern, Chair-Search Committee, Department of Performance Studies, Theatre/Interpretation Center, Northwestern University, Evanston, Illinois 60208 (tele.: 312/491-3171 - inquiries Welcome).

The Commission on the Bicentennial of the United States Constitution is launching a second round of grants competition for use at the elementary and secondary school level. Deadline for receipt of applications is March 15. Sample of first round projects: 44-minute film on Constitution for secondary school students, four-week seminar on the Constitution, three-day conference for teachers of the Constitution, preparation of 38 lessons on the Constitution for use in the eighth grade. Submit applications to Commission on . . ., 736 Jackson Place, N.W., Washington, D.C. 20503. For more information call Tish Avery 202/653-5244 or Anne Fickline 202/653-5110.

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with content that draws upon the human cultural heritage, methods that derive from the humanistic disciplines, and a purpose that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Seniors Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanities**, **humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three commentaries, etc.; and articles of six to ten pages (3500 work maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have word-processed your article, please specify the program you used (we use Word Perfect). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

*THEORY "Piaget and Theories of Integrated Study"

*ADMINISTRATION "Crediting Departments for Team Teaching"

*HISTORY "Nineteenth-Century Multi-Media at Chautauqua"

*RESEARCH "A Comparative Study of Writing Skills Development
in Freshman Composition and Western Civilization"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

*"What you should know about teaching novels in a philosophy course"

*"Pre-teaching history students for an art museum field trip"

*"How to help non-musicians to follow a score"

*"A designer speaks of humanities bulletin boards"

*"Getting adults to role-play in public humanities programs"

*"Understanding Oedipus: An Actor's View"

What we don't want:

*Creative writing by teachers or students (it doesn't relate to our purpose)

*Syllabus outlines (curricula should be explained, not listed)

*"The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)

*"Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)

*"Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

CONTRIBUTOR INFORMATION

Contributors should consult the Editorial Policies sheet carefully. As will be seen, HE is wide-ranging, quite permissive and has no "party line" in respect to definitions of **humanities, interdisciplinary** and **education**, but the wide boundaries are nonetheless firm. Please do not submit articles over ten pages long unless you are planning to revise.

Copyright 1988 by HUMANITIES EDUCATION

FROM THE EDITOR: The following four articles describe the rationales and methods of college humanities courses from Freshman to post-graduate years. William Wallace describes courses at Western Washington University that examine whole cultures by way of in-depth study of a few major texts. Edmund Burke explains courses at Coe College that emphasize formal analysis of a larger number of artifacts from a variety of disciplines and arts. Richard Danner's interdisciplinary course on irony at Ohio University is for seniors, while Joseph Wessling tells of a course specially developed for the Master of Humanities at Xavier University. Is there a common thread that defines these as humanities? And is there any commonality in method among these widely disparate courses? We think so, because each is deeply concerned with the teaching of reading--reading as an act of illumination, enlightenment and self-discovery.

William Wallace

A RADICAL APPROACH TO HUMANITIES

What exactly **is** a "humanities" course? What exactly do we **do** to distinguish those courses from other courses in English, history, or other disciplines generically grouped under the title "humanities"? What emphases and methodologies distinguish these courses? These kinds of questions are maddingly difficult to explain to a layperson or even to a biochemist colleague familiar with terms like "interdisciplinary." The reactions to Mr. Bennett's 1985 address advocating a return to a traditional canon of great and timeless books made clear that the questions also provoke serious and even hostile disagreement among those of us who design and teach such courses. The very real problem of definition and purpose, especially with regard to traditional canons, calls for an approach to humanities courses and programs that descends from Renaissance **humanistas** like Petrarch and Valla.

From the perspective of one advocating that substantial works significant to their cultures be taught in the relevant humanities courses, Mr. Bennett's "To Reclaim a Legacy" was an egregious and unhelpful polemic. It came late: most institutions have stopped the proliferation of smorgasbord courses, eliminated the worst, and insisted on at least minimal standards of literacy and eloquence (i.e., reading texts and writing about them). Worse, his remarks set up an indefensible straw man. Members of minority groups, feminists, and others concerned for multi-cultural and non-western studies are especially mistrustful of any canons. They vigorously object that traditional canons are by their nature racist, sexist, and at best parochial, serving the interests of narrow economic or other power groups, that they prevent the accommodation of more relevant interests, and that they are elitist, suited neither to the experience of the non-traditional student nor to most of the rest. Others object that teaching from a received canon of traditional texts cannot foster the critical think-

891

ing necessary in an increasingly diverse and complex world. The most damaging practical charge is that the "coverage" in traditional canons results either in a lack of context or, worse, a naively shallow, false overview. Of course, there are those who celebrate the "deconstruction" and decay of this curriculum of major texts as "a good thing" because, wittingly or not, they have an ideological agenda of their own.

But even one enthusiastic to teach works from the traditional corpus is uncomfortable with prescriptions like Bennett's. These seem to refer to a virtually fixed list of books existing in their own immutable eternity, not to a curriculum of great and historically important works rooted in history, to be read with a constant awareness of their historical distance and context. One has reason to fear that in practice what are called the "great ideas" and insights gained from the "great souls" would be found in selections from texts chosen to fit a Procrustean agenda.

Actually, I suspect that few of us would wish to ally ourselves either with Bennett or with those who would dispose of the traditional corpus completely. There is much more tacit agreement among us than we are used to admitting. When we bemoan the generic and specific incapacities of our students we betray a common assumption that they should understand more about things upon which we are generally agreed. Foremost among these capacities is the ability to read a text--to read a text with a real awareness of the problems of cultural, generic, and historical context.

To that end, consider a profoundly radical but old approach to teaching humanities, one which subtends a number of serious ideological and pedagogical problems, an approach as workable for non-Western as for Western traditions. Rather than approaching "the humanities" as a smorgasbord of materials (however tastefully and coherently chosen and arranged) borrowed from the departmental disciplines, philosophy, history, etc., we should recognize that until comparatively recently these materials were the common property of literate people, the **padiea** of the Greeks, the **studia humanatatis** of the Romans and the Italian Renaissance **humanistas.**

We should teach courses in the humanities with such Renaissance Italian humanistas as Petrarch and Valla rather than modern prescriptionists like Bennett as our guides. The latter hark back to men like John of Salisbury who knew and cherished ancient texts for their supposedly timeless meaning and value to their own Christian universe. In contrast, the quattrocento humanistas "investigated ancient history and mythology, ancient customs and institutions in order to understand the texts on their own terms" (Gilmore, 6-7).

> Humanism made clear for the first time the perspective of historiographic distance. [The] attempt to understand the personalities of literary men and the philosophers of the past in their own world are all the indications of humanism's fundamental concern for historicity. [T]he humanists were aware of the value of this task and they insisted on it and insured its continuance by leaving it as a legacy to modern culture (Abbagnano).

Today, with inexpensive, well-restored, edited, and translated texts available to us, we should return to Valla's example. The first goal of a humanities course should be a reading and understanding of its texts as close as possible to that of their original authors and audiences. In the case of texts drawn from the Torah (see below) and Amerindian traditions, one will go behind even this to understand the text in terms of its own layered history. For this approach to work, a number of things too frequently spoken of as higher goals must be emphasized as basic from the start. These are: close, sensitive reading of the actual text, openness to diversity and complexity, alertness to dissonances within the text and between the text and the reader's own assumptions and expectations, a working appreciation of textual complexity, of historical distance, and of differences among cultures and periods in respect to their most basic assumptions. The last is perhaps the most enduring and valuable, for as the students increase their insight into the (frequently unstated) assumptions and values underlying the work and its culture, they become more aware of the values and assumptions underlying their own.

Let me explain how such courses do work in the Department of Liberal Studies at Western Washington University, a regional, comprehensive institution enrolling about 9,500 students. The department is a small one of seven to nine faculty whose chief role is to offer interdisciplinary humanities courses to fulfill general education requirements in the areas of both "humanities" and "non-western cultures." Recently, we replaced our tutorial major with one quite directly outlined in the general catalogue.

I regularly teach Lbrl 121: Humanities of the Ancient World, a "required," five quarter-hour freshman course regularly enrolling 35-45 students per section. I use the following texts: Genesis; Homer's Iliad, entire; Aeschylus's **Orestia**, entire: and Books 1-6 of Virgil's **Aeneid**. There is no attempt at coverage; the rationale is to focus on texts from four comparable but different cultures. (Although the three freshman humanities courses are prerequisite to the major, individual instructors retain total autonomy in syllabus and text selection: our Greek specialist reluctantly leaves out Homer to make room for **Gilgamesh** and New Testament material.)

I choose Genesis first because it must be treated as a "text," to be studied and deciphered. To the general student coming to it as a subject of academic study for the first time, it is so strange, so seemingly jumbled, incoherent, and contradictory in details that it is, in fact, impossible to read (or to misread) as a straightforward narrative or chronicle. Homer's **Iliad**, Aeschylus's **Orestia**, and Virgil's **Aeneid** provide three works which, as too frequently treated in college as well as preparatory courses, seem homogeneously "classical," but which upon close examination prove most interesting for the contrasts in their underlying concerns and assumptions. An understanding of the basic assumptions in the world view of Homer's warriors is of course necessary to an understanding of the central events in the narrative, and even more to appreciating the pathos of Hector and the tragic character and role of Achillius. In the **Orestia**, however, these same heroic values are themselves the major problem energizing the larger theme central to the trilogy, that of the well-lawed polis. The centrality of Roman **imperium** and **pietas** in Virgil's **Aeneid** provides yet another contrasting world view.

Genesis works well as the beginning text in the course. Most students have something of a built-in interest in Genesis because they are aware that it is important to their own Jewish and Christian culture and tradition. Some students approach it with proprietary concern, others with an agnostic hostility, but almost all know that it is still supposed to be important. They are thus, more than is the case with other seemingly impenetrable texts, willing to try to unravel the puzzles. The project is to get the students to begin to notice for themselves dissonances in the text which they can explicate, discuss, and build upon. Reading Chapters One through Eleven serves to confuse them and provokes a number of questions about sequence, differences in detail in the Noah stories, and so on. A close reading of Chapter One over against Chapter Two, noting the obvious differences in focus, concern, narrative type, and factual detail (plants and animals created before or after humankind, for instance), is an exercise possible for the general student, after which some of the more daring may observe that it seems that two different people with different concerns seem to be behind them. They may then wish or be required to discuss the "meaning" of each version for themselves. This provides an experiential basis for a discussion of the theories of Biblical scholars about the formation of Genesis. After this, students can be led through the Cain and Seth lists, the two Noah traditions, into the Abraham and Jacob stories and an analysis of the different concerns of the earlier and later writers in light of the different historical and cultural circumstances and concerns out of which each is supposed to have been written. A critical reading which notices that different passages betray different styles, concerns, and authorial traditions is a useful exercise in critical thinking. It in no way prevents my students from noticing and vigorously criticizing what they call the sexism, racism, and imperialism in the cultural values underlying many of the discrete stories within the Abraham and Jacob cycles. This same ability to read a text sympathetically within its own context but to criticize its values from their own continues throughout the course, especially in the **Iliad** (e.g., Hector taking his leave of Adromache) and the **Aeneid** (nearly throughout).

Lbrl 302, Introduction to Interdisciplinary Studies, is an introductory seminar limited to students admitted as Humanities majors after having completed the fifteen quarter hours of freshman humanities (Lbrl 121, 122, 123). It is focused on a close reading of the entire **Commedia** of Dante Aligheri in the cultural, historical, political, and philosophical context of late medieval Europe. Since Dante set out to create a work which was a mirror of the entire universe, the **Commedia** is especially suited for use as an exemplar of the techniques of interdisciplinary study. Its inclusiveness reflects the inclusiveness of humanistic inquiry; its large structure and difficult nature prepare students to analyze and understand other large complexes they will meet in the three senior seminars and in formulating and writing their senior thesis. During the quarter's work, each student completes an annotated bibliography on a topic related to the **Commedia** and writes an 8-10 page documented paper based on that research. (The seminar, designed for eight to twelve students, enrolled twenty-three last fall; twenty-two completed it.)

Particularly for the **Inferno**, the temptation of an impressionistic reading, of going directly to the poem's riches without allowing scholarship to intervene, is great. But such an attempt to extract the meaning of the poem from the text itself ignores the six hundred years of change in European culture between Dante and ourselves. Thus, though I assign a first naive reading of three or four cantos a night, I begin the term with lectures and discussion of C. S. Lewis's **The Discarded Image**, a treatment of the popular medieval world view common to Dante's contemporary readers. This dual approach of a naive reading simultaneous with mature background material gives the students frustrations in understanding the text which lend point to the contextual material on which they are working and insight into the enterprise of humanistic inquiry. From their freshman courses, students are somewhat familiar with such necessary topics as allegory, plenitude, hierarchy, Ptolemaic astronomy, and medieval Roman Christianity, but too many (children of the Enlightenment) still assume the culture of medieval Christendom to have been primitively simple. Lewis, who avoids discussing writers like Ovid and Virgil in order to focus on those who, like Statius, are virtually unheard of today but immensely important to medieval culture, confronts them with the sheer size and complexity of that intellectual culture: with its sources in late pagan antiquity, its bookish reverence for ancient writings, the largely Platonic assumptions behind such important doctrines as plenitude and hierarchy, and the conception of a hierarchial physical universe which inversely mirrors the moral and spiritual one in its relationship to God. After about ten class days, students have read the **Inferno** through and have an idea of the background necessary to read the text closely in its context.

We begin with a virtually word-by-word explication of the first five cantos of the **Inferno**. This involves a number of interdisciplinary topics: the allegory of Dante the poet/pilgrim/everyman character in the poem; allegorical iconography in the wood, hill, sun, etc; Aristotelian ethics and the three beasts; Virgil and the idea of Roman **imperium**; and Dante's own theories of papal and secular power. Here students start to choose and begin work on their quarter-long research topic. After canto five, whose events and their structure are paradigmatic for the rest of the canticle, we move progressively faster and more selectively through the poem. (Students are advised to read well ahead of class discussion since both the **Purgatorio** and the **Paradiso** are discussed in about the same amount of time spent on the **Inferno**. The quarter system does take its toll.) Although particular sections of each canticle are specifically assigned for discussion (eg, **Inferno** xi on the classification of sins, **Purgatorio** i-v as introduction, the free-will cantos xvi-xviii, and the first and last five cantos of the **Paradiso**), such topics as the growth and education of Dante-the-pilgrim and the theme of human discourse are to be followed throughout each canticle. Students are of course encouraged to bring their individual confusions and insights on any passage or topic to the seminar table.

Last and essential: from the beginning of the term and especially once the discussion of the **Commedia** begins, there is a premium on student interaction, whether in the form of questions, simple queries or insights into large concerns significant to the text and period; answers or contributions to these; responsibility for certain cantos assigned to individuals or groups of students; to inquiries about or helpful suggestions arising from their library work. Since the library here is no better than those at most other regional universities, the last, along with interlibrary loan, is essential. The research topics chosen or developed by the students range from Dante's use of medieval animal lore, to his development and use of the Ulysses theme, to his adaptation of love motifs in the figure of Beatrice (divine love). Especially after the middle of the term, the research topics increasingly inform the discussions with, for example, the student working on "Light and Mirrors" becoming one of the de facto leaders as we discuss the **Paradiso**. The last several class meetings and the time during exam week are given to student presentations based on their research.

Libl 302 follows directly from the required general humanities courses and successfully prepares students for advanced senior seminars ("Techniques of Cultural History," "The Historical Transformation of Major Texts". . .) and the development of their senior theses in which a working appreciation of textual complexity, historical and cultural distance, and the ability to use such research instruments as the **Humanities Citation Index** are given. Our experience in Liberal Studies, both in general education courses and the Humanities major, indicates that at regional comprehensive universities--given a collegial department of faculty trained in diverse textual traditions with very different specializations (and personal ideological commitments)--various **studia humanitatis** can be successfully taught.

Edmund Burke

UNPACKING THE TEXTS IN TWO INTERDISCIPLINARY COURSES

Inaugurated in the fall of 1974 under the aegis of an NEH Program Grant, the Humanities Program at Coe College ambitiously set as its principal objective a revitalization of student interest in the study of the humanities at the college. Although the Program was dissolved as an administrative unit in 1987, approximately half of the Program's courses were integrated in one way or another into the college's curriculum. Moreover the approach of the course Introduction to the Humanities, a broad interdisciplinary survey, served generally as a model for one of the college's new (in 1982) core courses for freshmen, Introduction to Modern Culture, which also is an Interdisciplinary survey of the West, but from the Enlightenment through the early twentieth century.

Both courses are self-consciously predicated on the view that as a field of study the humanities are different in perspective from other fields of academic endeavor: viz. the natural sciences, the social sciences, and the fine arts. The fundamental distinguishing trait of the humanities is their historical orientation; the study of humankind's achievements in the past, as opposed to the efforts of the natural sciences to measure the material and physical world, or those of the social sciences to measure and evaluate the contemporary human environment, or those of the fine arts to produce creatively. To be sure, overlapping among the materials of these fields is acknowledged; but emphasized at this introductory level is the peculiarly historical perspective of the humanities. To reinforce this point, both Introduction to the Humanities and Introduction to Modern Culture are organized diachronically; the former moves systematically from Greece, to Rome, to the medieval period, and ends with the Renaissance, while the latter begins with the Enlightenment, moves to the Romantic era, then to the later nineteenth century, and ends with the earlier twentieth century.

There is at least one additional advantage to so organizing both courses into, as it happens four, distinct historical units. Such structuring actively invites students to recognize both continuities and differences between and among the periods: a practice which is reinforced, as will be discussed below, by the selection of texts. Paradoxical as it may appear, such active comparing and contrasting as is invited by the clear diachronic arrangement, tends actually to heighten student awareness that history is rather a continuum than a set of discrete temporal units.

Methodologically, however, increased historical awareness is the final objective of the courses. Logically, such awareness can occur only after students have grappled with the specific texts, for it is these in fact which constitute the evidentiary base of historical understanding. The texts that constitute the daily assignments and whose analysis is the first objective of both courses are uniformly primary sources, though necessarily translations are used in both courses as appropriate. Secondary and background materials are also required in both, though these are intended principally to assist integration of materials and as review aids for examinations.

In so relying on primary texts, we seek among other objectives to make clear to students that the disciplines of the humanities, while constituting a distinct field of academic endeavor, are nonetheless to be distinguished one from another; so that, for instance, the methodology of literary analysis is to be recognized as different from that of art criticism, as it is from that of music appreciation, etc. On the face of it such distinctions are easily made; it can be demonstrated readily enough that a painting, a sonata, and a poem are apprehended by different intellectual faculties and that, logically, different methodological approaches are appropriate to the appreciation of each. As easily made in theory are distinctions in the methodological approaches to be taken in the analysis of the written texts of the humanities--literary, historical, and philosophical/religious--though as a practical matter the demonstration of such differences proves difficult. As written texts, all are apprehended by the same faculty, and there is the risk of appearing the hair-splitter in claiming significant distinctions, for example, between the methodology of unpacking a Platonic dialogue and an Ibsen drama. Thus, we do not gainsay a fundamental methodological similarity among the written texts of the humanities; differences of approach in the analysis of these, as will be shown, are illustrated by other means.

A variety of factors influences the selection of texts, some objective, others less so. Among the more subjective, we attempt to use materials that are recognized as "legitimately representative" of an era or cultural period. The potential for historical over-simplification with such a criterion of selection is, of course, real, but at this introductory and survey level our preference has been to emphasize the representative over the eccentric. As well, texts are chosen which have been judged to be "legitimately representative" of the specific disciplines of the humanities. With a course like Introduction to Modern Culture especially, which is required of all freshmen and is taught by faculty from every department of the humanities, self consciousness about individual departmental judgments on the suitability and representativeness of texts is important.

Among the objective considerations affecting the selection process is that the texts be complete works, though some exceptions have been tolerated. Typically, we have found, students are disinclined to re-examine a textual fragment or an excerpted chapter, and with materials rich in substance, re-examination is to be encouraged. Further, the texts selected are of such a length as to be teachable in detail within three or fewer contact hours. Beyond enlivening the pace of the courses, texts of limited size tend better to allow students to focus simultaneously on the content and the method of analysis. Indeed, it is the methodology of analysis about which we work to make them especially conscious, and with texts of too great length this objective can be lost in the detail of content. Brevity allows for sharper focus.

To promote facility in the exercise of methodology, texts of a type appear more than once in the courses. Thus, for instance, in Introduction to Modern Culture there are four units on painting: one on Neoclassicism, another on Romanticism, a third on Realism and Impressionism, and the last on Picasso. In each unit, the principal objectives are the same: the systematic analysis of visual elements--linear and spatial composition, light, color, etc.--and the relationship of these to iconographic elements, viz. the picture as narrative. Thus repeated, the method of analysis becomes familiar to students, so that by term's end, typically, paintings such as Picasso's **Absinthe Drinker** or his **Les Demoiselles d'Avignon** suffer reasonably acute analysis at the hands of the students, who at the start of the term tended to view a painting like J. L. David's **Oath of the Horatii** almost exclusively from an iconographic perspective.

Repetition of exercises that are complete and relatively concise is, then, the principal means by which we attempt to instill an awareness of the importance of methodology in textual analysis. Nor do we insist that the texts in these exercises be identical in genre. Again with examples from art, there are in Introduction to the Humanities three units: the first on Greek **kouros** sculpture, the second on Gothic architecture, specifically Chartres, and the third on Renaissance painting, most specifically Leonardo's unfinished **Adoration of the Magi**. Common to all three of these units is again the attempt to identify the purely visual elements and to note the relationship between these and the image: whether male nude, cathedral, or Mary, Christ Child and attendant crowd. If students become habituated to the need to identify the relationships between 'form and content' and acquire some experience in the practice, then, we believe, they will have taken a first step in the methodology of art criticism.

In fact, a primary objective in our approach to the analysis of many of the texts of these courses is to heighten awareness of form, i.e. the presence--or lack thereof--of principles of organization. The first unit in music in Introduction to Modern Culture, for example, focuses especially on the use of the sonata allegro form in the Classical era, specifically by Mozart in **Eine Kleine Nachtmusik**. Later in the term, Berlioz's **Symphonie Fantastique** is analyzed, with particular attention devoted to the first movement, where again the sonata allegro form is in evidence, but in such an altered guise from the Mozart as to make clear certain of the differences between Classical and Romantic style. Other differences are also noted, of course, but those of form are central to the units, as they are later in the course when the impressionism of Debussy and the atonal music of Schoenberg are analyzed.

Awareness of form is also a principal methodological concern in the analysis of the philosophical texts of Introduction to the Humanities. Here we examine Plato's **Phaedo**, Boethius' **Consolation of Philosophy**, and More's **Utopia**. In each a first step taken to unravel the often complex arguments is to see how the works are designed. It can be shown at times that content in fact is revealed by form. So in the **Phaedo,** a plotting of the course of the dialogue will indicate that for Socrates convincing his audience not to be haters of reason (misologists)--and all that that term implies about open-mindedness in debate--is as critical as convincing them by arguments that the soul is immortal: arguments which most undergraduates can rebut. No less, an analysis of the first book of More's **Utopia** reveals a particularly deft illustration of the ironic detachment which author More would maintain, if temporarily, from the views of his creation, Raphael Hythlodaeus. In sum, the recognition of formal elements is a methodological step that can be shown to be common to the analysis of a variety of materials in the humanities: visual, aural, or written.

With works of literature, fiction and poetry, examination of form can also be helpful as a means of analysis. But with these texts we tend to emphasize other devices of analysis; and with this begin to illustrate certain differences among the written texts of the humanities. In Introduction to Modern Culture, there are three units on poetry: one on Pope's **Essay on Man**, the first epistle only, another on Wordsworth's "Intimations Ode," along with some shorter poems elucidating themes found in the "Ode," and the third on T. S. Eliot's "Love Song of J. Alfred Prufrock." None of these works is susceptible to quick, facile analysis, and the Wordsworth and Eliot poems especially are sufficiently subtle of thought as to invite from undisciplined readers the widest and wildest interpretations. Our approach is to stress first the identification of poetic punctuation, syntax and grammar; to have them identify the rhyme scheme, if present; to identify whole sentences and to note the correlation between these and the rhyme; to look for repeated phrasing in stanzas; to rearrange complex word order so as to establish the more conventional subject-predicate relationships; to identify the referents in similes and metaphors; in sum, to unpack the poem in such a way as to make it as much as possible an objective, narrative statement. Such an approach, we have found, which eschews brilliant insight for systematic analysis, disciplines students to be more careful readers of poetic texts, and at the introductory level this is our principal objective.

Fiction typically proves the least difficult medium to introduce; it is the sort of reading that students generally have done most, and the practice of identifying significant characters and following the flow of plot has been reinforced by their experience with film and TV. Because of this prior experience, we can focus our attention on such particular concerns as devices of plot structure or on broader but less fully appreciated issues such as the role of setting. In Introduction to Modern Culture students read **Candide**, M. Lermontov's shorter Romantic novel, **A Hero of Our Time**, and Kafka's **Metamorphosis**. With **Candide**, for example, identification of the picaresque nature of the hero's adventures serves to reinforce judgments on the fallibility of Pangloss' optimism about the perfect order of the universe. As Candide shows, all is random. No less, recognizing that the events as presented in **A Hero of Our Time** are out of conventional chronological sequence helps further illustrate Romantic "abnormality." Similarly, a clear visualization of setting is critical to a fuller appreciation of Lermontov's masterpiece. The contexts in which the actions of the novel unfold, while varied, are almost uniformly sublime, thereby further effecting a sense of the Romantic. So, too, awareness of the starkness of Gregor Samsa's room serves to reinforce judgments about the sterility of his existence and his alienation. Heightened awareness about such issues as plot devices and the role of setting, while perhaps not the stuff of a genuine methodology, is nonetheless vital to a fuller appreciation of fictional texts.

Our approach to effecting a sense of the methodology of history is different from the approach taken with the other disciplines; in part because different from them there is prerequisite to historical criticism a familiarity with a body of data of one sort or another. Still, our approach here is also one of multiple steps, the first of which is embedded in the design of the courses. As students progress through the temporal units of the courses, analyzing the different types of texts, they are naturally invited to make comparisons and to draw conclusions. Necessarily, the judgments made are limited, but in making them the students act the historian, drawing selectively on a variety of sources and qualifying conclusions in the face of conflicting or inconsistent data.

In Introduction to the Humanities the second step taken is to read an original historical monograph, the encomium **Agricola**, written by Tacitus to the memory of his father-in-law. Though brief, the work requires some unpacking, but throughout the exercise there are noted ways in which biases--cultural, intellectual, and personal--affect historical judgments: Tacitus' and the students' own. Finally, the students are given an historical case study to work through. We have designed a unit on the reign of Richard III, the objective of which is to determine responsibility for the death of Richard's nephew princes in the Tower of London. There is a preliminary background lecture, followed by discussion of two contradictory and clearly biased interpretations of the events: Shakespeare's Richard III, the villain, especially as portrayed by Lawrence Olivier, and Josephine Tey's Richard III, vindicated in her pop novel **The Daughter of Time**. Beyond reinforcing the issue of historical biases, the exercise of viewing the film and reading the novel also reinforces student familiarity with the events and people in question. Finally, the students are asked to solve the mystery by relying on a packet of materials we have prepared. The packet contains various types of evidence, including primary documents, a medical report on the skeletal remains of two youths found in the Tower, and a detailed and accurate chronology. Typically the exercise produces heated discussion and necessarily allows no certain resolution. Though varied, these three exercises do work cumulatively to heighten student awareness about some of the methods and problems of historical analysis.

In sum, Introduction to the Humanities and Introduction to Modern Culture have three principal objectives. Each surveys a broad span of Western culture, from antiquity to the Renaissance, and from the Enlightenment to the mid-twentieth century. As well, each requires that students engage significant, substantive and varied texts within these cultural contexts. Finally, each attempts, deliberately and self-consciously, to make students aware not only of what the humanities are comprised but as importantly how they are to be understood.

TEACHING AN INTERDISCIPLINARY COURSE ON IRONY

Ohio University's general education requirements for undergraduates fall into three categories. Tier I involves courses in English composition (freshman and junior levels) and in quantitative skills. Tier II, our "breadth of knowledge" requirement, offers a wide range of courses in the major fields of learning; students must complete a total of thirty credit hours taken in at lease four of the five distribution areas--applied science and technology, humanities and fine arts, natural sciences and mathematics, social science, and third world cultures. Tier III, now in its third year as a university requirement, is the senior-level element of the general education program. All seniors (except those in the Honors Tutorial College) are required to take an interdisciplinary synthesis course in which, ideally, they have opportunities to apply knowledge acquired in their own field of specialization to a topic designed to interest students from a wide range of disciplines. Some of these courses are team-taught; others have been developed by one faculty member, who will perhaps invite guest lecturers to address the class. A selective list of course titles will give an idea of the range of Tier III options available to our seniors: "The Nuclear Era" (involving professors from political science, physics, and history); "Science, Culture, and Human Values" (taught by a member of the German faculty); "Social Crises in Medicine"; "War: Historical and Dramatic Perspectives"; "Cultural Traditions and the Arts"; "The Autobiographical Quest"; "Evolution and the Challenge of Creationalism"; "Entropy and Human Activity"; "Shakespeare and Psychology"; "Cognitive Processes in Writing"; "Darwin among the Poets: England in 1859"; "Semiotics in Communication"; "Ethical Issues in the Human Services"; "Meaning in Music"; and "Images of Blacks in the American Mind." As chair of the General Education Subcommittee of the University Curriculum Council since 1983, I have carefully evaluated many Tier III proposals. I have been impressed by the array of imaginative courses developed by colleagues in many fields. Often the subject matter goes well beyond the primary discipline of the individual proposing the course, but that does not mean that the necessary credentials are lacking; all the Tier III courses we have approved possess intellectual credibility. Translating high educational aspirations into classroom practice can be very challenging, to be sure; the reports I have heard so far seem to indicate a mixed record, shining achievements being somewhat offset by disappointments. During the 1989-90 academic year a comprehensive review of Tier III will be conducted; many of us eagerly await the results of that survey.

My own Tier III course is entitled "Irony in Literature and Society." While doing research for my book on irony in the **Fables** of La Fontaine several years ago, I became so enthusiastic about the study of irony that I decided to broaden my investigation for instructional purposes. I had long been interested in interdisciplinary education, having developed and coordinated two team-taught courses involving faculty representing several departments: "Tradition and Change in Twentieth-Century France" (an undergraduate honors course) and "Decision-making, Public and Private" (for the Master of Liberal Studies degree program). Then in 1983 I had the opportunity to participate in an NEH-funded Summer Curriculum Seminar in Interdisciplinary Education on the OU campus; my Tier III course was developed in that seminar.

My involvement in the seminar turned out to be an immensely satisfying experience. We may take for granted a common critical vocabulary when we communicate with people in our own field, but it can be quite challenging to express our ideas in such a way that colleagues from such a variety of departments as mathematics, philosophy, home economics, political science, geography, journalism, and psychology will understand what we mean. Everyone participating in the seminar probably had at least a rough idea of what irony might be and how it works in certain environments, but it was my task to make sure that in discussing the tentative course outline, as well as examples of irony taken from several media, all my colleagues would be able to follow my line of reasoning. Successful communication was really vital at this level because my listeners were all bright, well-educated professors. I knew that if these people couldn't understand me I would be in serious trouble in the classroom, because in Tier III courses it is common to find students from several academic colleges. Well, my first oral presentation in the seminar left a good deal to be desired. I believe that everyone followed my explanation of the course structure, but when I began analyzing examples I ran into trouble. Part of the problem was that a few of the seminar participants expected quick solutions and became impatient when they were asked to probe for hidden meaning. It would be no fun to develop a course concerned primarily with overt irony. Another part of the problem was that I failed to ask enough leading questions. And finally, a couple of my examples may have been too obscure--at least for such an audience. Fortunately, in the second round of oral reports I was able to engage my colleagues in a much more lively and meaningful discussion of ironic devices.

This quarter I am teaching my course on irony for the third time as a Tier III elective. The enrollments continue to increase modestly. In winter 1986 I had nine students, representing eight majors in five academic colleges (Arts & Sciences, Business Administration, Communication, Fine Arts, and University College); last spring thirteen students completed the course, with an additional college being represented (Education); this fall sixteen are enrolled (nine from the College of Communication, three from Arts & Sciences, and two each from Business Administration and Engineering).

In planning the course I thought it would be important to consider ironies in as many disciplines and symbol systems as possible. Each time I have offered the course I have made some structural changes, but the conceptual core remains the same as when I first began developing it. We always consider various theories of Irony, especially those of D. C. Muecke and Wayne Booth; I try not to impose my own views, but I have found that in this area many students need a good deal of patient help. This quarter prose fiction is the first and last genre to be discussed; I chose two strikingly different novels, opening with Kurt Vonnegut's **Breakfast of Champions** and closing with **The Company of Women** by Mary Gordon. We have examined irony in pictorial arts with the aid of a slide presentation; we have also read and discussed Susan Sontag's **On Photography**, not only because she implicitly reveals a number of ironies underlying photographic art but also because she provides an excellent model of interdisciplinary writing, for she is informed, creative, eruditely articulate, and elegantly combative. The students reported on the ironic strategies employed in films of their choosing, paying special attention to techniques that exploit the unique resources of the medium; as a group we saw the Peter Sellers movie **Being There**. We always read some plays; this quarter seven dramatic works in an anthology of modern theater were assigned, including works by Brecht, Beckett, Durrenmatt, Genet, Pinter, Ionesco, and Stoppard. Depending on the stage productions that have been scheduled, we sometimes attend theatrical performances on campus; in winter 1986, for instance, the Ohio University Theater presented four plays by the important American playwright Sam Shepard, whose vision fits the course theme very nicely. We always spend a day discussing irony in music; in addition to encouraging the students to provide examples, I have them listen to a cassette on which I have recorded selections from several well-known musical comedies. At the end of the term we will address two central questions: 1) Do the ironic structures created through language differ fundamentally from those found in the visual arts and in music? And 2) In what ways can irony be a vehicle for the integration of knowledge?

The course grade is based on discussion (30%), journal (20%), midterm exam (10%), term project (20%), and final exam (20%). In addition to discussing works on the reading list, short passages taken from other literary and expository works, aspects of cinema and live theater, all course participants are asked to bring to class every week two examples of irony--one taken from a published source, the other invented or found in a nonverbal medium. The journal (approximately 3-5 double-spaced, typed pages per week) is intended to be a wide-ranging, open-ended log of each student's ongoing confrontation with the course theme.

The term project (10-12 double-spaced, typed pages) should attempt to demonstrate the hypothesis that irony can be useful in integrating knowledge from two or more fields. I employ these evaluation criteria: organization; definition of irony adopted--coherence and applicability; analysis of material; appropriateness and specificity of examples cited; language skills (grammar, syntax, usage, style); effectiveness of interdisciplinary synthesis. Topics chosen in past quarters include an analysis of ironies in representative cartoon frames from **The Far Side**, a comparison of images of the American dream in **Breakfast of Champions** and in magazine advertisements, and religious issues in **The Company of Women** in light of contemporary American society.

The midterm and final exams include essay topics and analysis of texts. For instance, as part of one exam students received a copy of a photograph by Nic Nicosia entitled "Near Modern Disaster," and they were also given a written commentary by Douglas Davis from the accompanying **Newsweek** article, "Seeing Isn't Believing" (3 June 1985). Then they were instructed, "Analyze the ironies in Nicosia's work by referring to Davis' analysis and also by taking into account this comment of Susan Sontag (in **On Photography**): 'Photography implies that we know about the world if we accept it as the camera records it. But this is the opposite of understanding, which starts from **not** accepting the world as it looks. All possibility of understanding is rooted in the ability to say no. Strictly speaking, one never understands anything from a photograph'." Here is another example of an exam question: I quoted D.C. Muecke's hypothesis "that the nature of drama is such that plays tend to be ironical as a result of internalizing one or more elements of their immediate theatrical environment or context. . . ." (Muecke cites "internalizations. . . of production and performance, . . . of the playwright, the director, the actor, the audience and the script.") Then I told the students, "Analyze a play that you have seen performed recently . . . by indicating the degree to which internalizations of various kinds (as explained by Muecke) contributed to the ironies found in the production."

So far, what have been the most successful teaching strategies in my course? 1) The examples of irony provided by the students and discussed in class. This weekly exercise helps keep even the reticent people involved in class discussions. Each student is asked to explain why a given example is ironic; this can lead to interesting debates about the meaning of irony in context. 2) Questions based on the reading assignments. Students are encouraged to look for signs of irony as they read. My questions in class typically begin at a general level, so that students have an opportunity to demonstrate how they probed and organized the material; then I ask them to discuss ironic strategies found in specific passages. 3)Discussion of ironies in films, with emphasis placed on differences between cinema and other art forms. 4) Cases for study (provided by me in a series of handouts). These are examples of irony in various disciplines. This technique is designed to prompt discussion and to illustrate the range of texts displaying ironic elements.

What strategies have been at least somewhat inadequate? 1) The presentation of theories of irony. Some students, especially a few whose majors are far removed from literary studies, have difficulty moving beyond basic definitions. 2) The discussion of irony in photography. Despite the brilliance and polemical energy of Sontag's **On Photography**, some of the students have had trouble grasping her arguments and finding how they can be applied to the concept of irony. 3) The analysis of slides illustrating irony in painting. In winter 1986 some of the students appeared to be unconvinced that the examples chosen were ironic. (I selected works ranging from the romantic period to Picasso). I think my presentation of this segment of the course has improved a little each quarter.

What have the students themselves had to say about the course in their anonymous end-of-quarter evaluations? The reactions have been generally positive. Here are a few responses to the question, "Did the instructor achieve synthesis?" 1) "Yes. I found that I am able to find irony in practically any discipline. . . .I think that looking for ironies can make life in general more interesting." 2) "Without question the course has brought together under one main rubric many disciplines. The knowledge acquired in this class seems invaluable. I can't recall a course where recollection, experience and intellect have been so important." 3) "Yes. The course has re-lit an intellectual circuit, and has allowed me to look at things in different ways." 4) On the other hand, one student in particular made clear that I cannot afford to gloat: "Yes. There was some synthesis but the synthesis was not valuable. It made me recognize certain things but nothing of substance."

Finally, how does my course on "Irony in Literature and Society" relate to the overall philosophy of Tier III? I have shaped this course to fulfill some of the goals of a liberal education as well as those of an integrative general education program. The main objective of Tier III is interdisciplinary synthesis, which involves analytical thinking, imaginative efforts to bring order to scattered fragments of knowledge, rejection of the view that ex cathedra wisdom is the primary source of learning, and the awareness that higher education is less a product than a process. In short, any course that converts the ideals of Tier III into classroom reality will necessarily contribute to the liberal education of the students enrolled in it. These are my assumptions as I continue the trial-and-error tactics of making my Tier III course a meaningful component of the participants' undergraduate experience: 1) prepackaged learning should not be the dominant mode of a college education; 2) professor and student should be engaged in a common quest for higher awareness; 3) in certain intellectual pursuits it is more important to ask the right questions than to find answers; 4) although specialization obviously plays a vital role in the advancement of knowledge, strict adherence to departmental boundaries often produces myopia, whereas interdisciplinary thinking can invigorate the mind, leading to sharper insights.

Let me invite others to develop courses on irony, the study of which continues to be an exhilarating enterprise. In "The Empire of Irony," an article published in the Winter 1983 issue of **The Georgia Review**, Wayne Booth wrote eloquently on the subject of irony and value: "When a piece of intended irony works, when a clever ironist manages to hook us, we come closer than at any other time to a full **identification of two minds**" (729); he adds that ". . . in moments of effective ironic communication, when much remains unspoken and much is understood that is not said, the two minds engaged together come closer to identity than is ever likely with straight talk" (730). Indeed, the pleasure of being alert to hidden ironic messages helps make life itself a keen esthetic experience. Once you start looking, you will find ironies of many kinds in virtually every academic field, making this rhetorical concept an excellent choice for the interdisciplinary curriculum.

907

ADDENDUM: SAMPLE CASES OF IRONY

Example 1 **POETRY:** An epigram by J. V. Cummingham:

This **Humanist** whom no beliefs constrained
Grew so broad-minded he was scatter-brained.

This tightly constructed couplet about a mind's metamorphosis portrays, in a comic register, the humanist, an individual who, however else defined, is interested in humans, **Homo Sapiens**, "... the only extant species ... distinguished by the ability to communicate by means of organized speech and to record information in a variety of symbolic systems" (**American Heritage Dictionary**). Ideally, humanistic thinking ought to be integrative, holistic, representing the triumph of meaningful synthesis over fragmentation. But the path to a perfect integration of knowledge must remain free of detours into dogmatism: along the way no belief should be viewed as more compelling than any other. Appropriately enough, Cunningham's humanist is characterized by a high degree of tolerance toward the various ideas he presumably encounters en route. Unfortunately, however, his liberal spirit is undermined by a wickedly suitable free association of ideas, an intellectual process by which, ironically, **Homo sapiens** distinguishes itself from other--ostensibly lesser-creatures: the positive epithet **broad-minded** is transformed into the pejorative **scatter-brained**. The synthesizing mind has been victimized by its own exceptional generosity; a vehicle apparently well equipped to organize learning on a grand scale has become flagrantly disorganized; the healthy absence of philosophical constraint has been transmuted into a total incapacity for concentration. The humanist having turned into a humanoid parody of himself, the poem has nowhere to go. Paradoxically, the incoherence of a flighty brain serves as an unmistakable sign of adequate closure; that is, a token of dispersal proves to be a unifying force.

Example 2 PAINTING: The setting: Le Monde Art Gallery, Cincinnati, Ohio. One sees a series of framed photographs composed by Peter Chou. Our natural-world expectations are overturned by the appearance of white (seemingly painted) objects: an apple, a lemon, a pepper, carrots (each fruit or vegetable is the subject of its own photo). Each picture also contains paint (tube, can, or roller pan) of a color normally associated with the natural object, and a blob of the appropriate color has been applied to each fruit or vegetable. Can any precise meaning be ascribed to a nonverbal situation? Probably not, but in this case it seems clear that the artist (or arranger) has chosen to adopt an ironic stance. The very distortion of these natural objects may imply that our traditional perceptions of them are illusory, and the added paint may suggest the artificiality of our initial impressions. The photographer may also be calling attention to his craft, a medium that selects elements of exterior reality rather than faithfully recording the physical world in all its complexity.

Example 3 FILM: In **The King of Comedy**, Robert DeNiro appears as Rupert Pupkin, a would-be comedian; Jerry Lewis plays the role of Jerry Langford, a talk-show host vaguely reminiscent of Johnny Carson. Pupkin tries to recreate the Langford show in his own apartment. He uses tapes, a simulated set, and life-size cardboard-backed photos of Langford and a guest (Pupkin sits between them, having just been introduced). One hears the off-camera voice of Pupkin's mother, who tells her son to make less noise. The jarring reality of Pupkin's mundane existence undercuts the tacky and pathetic fantasy world he has created for himself. Visual effects help to reinforce the irony of his situation. But the issue of Pupkin's ironic self-deception becomes problematic at the end of the film. Having been sent to a minimum-security prison for kidnapping Langford (as a means of gaining a spot as stand-up comic on the talk show), Pupkin profits from his time there by honing his comic skills, even writing a book about his experiences, **King for a Night**. As the story ends Pupkin has become famous and successful. Finally, by means of well-orchestrated auditory, visual, and verbal strategies, the film audience has become the collective victim of an ironic reversal: we have probably assumed that Pupkin was a comedian without talent, but when he appeared on the Langford show he generated a good deal of audience laughter, his material ringing with the wry honesty of a schlemiel triumphant.

Example 4 EVERYDAY LIFE: The explicator may enjoy, but cannot cope with, private irony, described by D.C. Muecke (in **The Compass of Irony**) as a type "not intended to be perceived either by the victim or anyone else." Here is an instance of irony destined to remain private--from the viewpoint of uninformed motorist. Several years ago, as I was driving on Interstate 70 near Springfield, Ohio, I spotted a bumper sticker--"There Is No Life West of the Chesapeake Bay"--on a car bearing a Missouri license plate. It is quite possible that the driver (and perhaps his family and a small circle of friends) would have been able to reconstruct the sign's real meaning without difficulty, but I was hopelessly perplexed. I knew that the words could not literally mean what they said, but essential clues for the interpretive process were lacking. Maybe the driver, having been raised in the East, had recently been transferred against his will to an office in St. Louis. On the other hand, he may have spent all his life in Missouri, was fiercely proud of living there, and had seized on an opportunity to put down those whom he considered to be Eastern Seaboard snobs. My point is that irony depends on a context--even if that context is filled with ambiguous but analyzable elements. In the case of this bumper sticker, however, all contexts one might imagine, competing endlessly with each other, would foreclose resolution. Thus private irony, though it might entertain us briefly, is best left unexplored.

(This paper was presented at the 9th Annual Conference of the Association for Integrative Studies, held at Pennsylvania State University in November 1987.)

Your membership includes a subscription to our quarterly journal, ***Humanities Education.*** We cover integrated humanities and arts in colleges, secondary and elementary schools, museums and adult public programming.

Joseph H. Wessling

TEACHING THE LANGUAGE OF THE HUMANITIES

I

In 1980 an NEH Pilot Grant enabled Xavier University to establish a Master of Humanities Program, designed for "business executives, members of professions, teachers, and any other mature adults who believe that encounters with the humanities can be exciting and challenging." This program was conceived and brought into being by Dr. Richard Gruber, who continues to serve as its director. One of the courses especially developed for the program is The Language of the Humanities, intended to:

a) expand and refine one's powers of written expression;
b) develop distinctions between humanistic and non-humanistic discourse;
c) explore relationships between a given humanistic vision or style and the sensibilities of the age which generated it; and
d) critically examine our own responses to a variety of humanistic works.

II

The expansion and refinement of one's powers of written expression are accomplished through bi-weekly essays, followed by revisions based upon the instructor's feedback, and through the keeping of a journal. The essay assignments are designed to develop, not only critical thinking, but habits of imaginative thought. Serious attention is given to figurative language and to allusive discourse, both of which are ways of thinking analogically--a mode of thought found not only in a Dylan Thomas ("The force that through the green fuse drives the flower/Drives my green age") but in a John Kennedy ("a New Frontier") and in anyone who sees another person as a Scrooge or a Pollyanna.

Exercises in the evaluation and generation of metaphors, personifications, and hyperboles precede the writing of a descriptive essay. "The stranger spoke in a greasy voice and his very presence gave a mustiness to the air." Can grease attach itself to sound? If not, what could justify the phrase "greasy voice"? Eliot's J. Alfred Prufrock might have said, "I'm no hero, not even an indecisive one." Instead his discourse is allusive:

No, I am not Price Hamlet, nor was meant to be
Am an attendant lord, one that will do
To swell a progress, start a scene or two,
Advise the prince; no doubt, an easy tool,
Deferential, glad to be of use,
Politic, cautious, and meticulous;
Full of high sentence, but a bit obtuse;
At times, indeed, almost ridiculous -
Almost, at times, the Fool.

The literate reader recognizes the Polonius allusion. Is this allusive discourse richer than the literal? More effective? Although analytical thinking is a decidedly human activity, is the language of the humanities likely to be analogical and synthetic rather than analytic and linear? Why?

When students are asked to generate original metaphors, they are cautioned to expect very limited success but advised that, as Chesterton said, "If a thing is worth doing, it is worth doing badly." This diminishing of expectations allows peer evaluation of student-generated metaphors to be relatively painless; and occasionally gratifying. Though only two or three students may display a genuine knack for metaphorical description, all will come to a newer appreciation of poetic imagery and be brought to see that such imagery emerges from close observation, from a habit of imaginative thought, and from a spirit enriched by great art--a spirit which has, in the words of Yeats, "monuments of its own magnificence."

As students move from description to narration, exposition, and argumentation, appropriate readings are examined, sometimes as models, other times to stimulate student response, as is common in writing courses. One good collection (such as **The Norton Reader**) will probably suffice, though for the argumentation assignment one may want to use a special collection. In 1984 I used **Opening up the Canon** (ed. Leslie Fiedler and Houston Baker) and in 1986 **The Informed Argument** (ed. Robert K. Miller). The above sequence from description through argumentation allows for incorporation of each mode of discourse into the next: description into narration, both of these into exposition, and these three into argumentation.

III

Contemporaneous with their writing instruction, students experience and respond to a range of artistic creations. Ideally, they should be experiencing art in all its forms: literature, painting, sculpture, music, dance, architecture-- whatever outlets may exist for the human spirit. Time constraints and the instructor's limitations require some selectivity. In my courses, the emphasis is upon poetry and painting. Because significant poetry is generated in virtually every period of Western culture, it provides an opportunity to examine the relationship between art and the sensibility of the age which produced it. Every cultured person knows that Renaissance poetry is different from the medieval, that neoclassical poetry is different from both, and that Romantic poetry has a still different character. An examination of the various sensibilities which generated poetry in those and later periods prepares students to consider the question: what are the sensibilities of our own time and place? (There is more than one sensibility in a pluralistic society.) The follow-up question is: what, if anything, gives one sensibility more validity than another? Wrestling with these questions provides an opportunity to overcome a jingoism of time and place--an assumption that my sensibility is the **right** sensibility--and to break down what Mary Lynn Johnson has called "the arrogance of the present toward the past."

Painting, too, provides an opportunity to examine various sensibilities, but, through a judicious use of John Berger's **Ways of Seeing**, it also provides an incentive to reexamine one's responses to all art--responses which are often an effect of questionable conditioning or yielding to a perceived expectation: the **Mona Lisa** is a masterpiece because everyone knows that it is. Berger's book is a challenge to the unexamined response. When is the painted nude art and when is it exploitation? What biases (e.g., capitalist, sexist) do viewers unthinkingly accept? (Most students need no help in detecting Berger's Marxist bias.)

In the closing weeks of the course, each student makes an oral presentation on an art work of the student's choice. It may be a painting, a sculpture, a piece of music--whatever meets the criteria of practicality and the student's competence. Because the Master of Humanities program attracts a diverse and largely mature group of students, the presentations have tended to be enriching to both student and instructor. One woman made a most interesting presentation on her own multimedia creations.

The most valuable part of the course for some students is the keeping of a journal. Sample journal selections from Joan Didion, Ralph Waldo Emerson, and Woody Allen show that a journal may be personal or impersonal, but that it should present responses to life and art, not a mere recording of external experience. Journal entries, edited for grammar and mechanics, are collected three times during the semester. The entries are not expected to be mini-essays (though an occasional student may go that route)--they are expected to ramble--to be the record of a mind in motion. It is important that the assignment not be an invasion of privacy; impersonal commentaries on readings and on current events are quite acceptable. Nevertheless, many students, once they realize that the instructor is a sympathetic and confidential audience, begin to reflect upon their most private experiences and concerns.

The journal is, of course, a writing exercise, but it is much more than that. It forces the student to reflect upon his/her experiences, whether cognitive or affective, whether of life or of art. The keeping of a journal precludes the unexamined life and the unexamined response. For some, it is psychotherapy; for others it is an opportunity to play with language; for all it is a means of introspection and a sorting out of their inner experience. Some include clippings in their journals; some draw in their journals; some compose poetic entries; a few drift into fantasy, which is an important part of the life of the mind and therefore to be encouraged. Only trivia and shallowness are discouraged. Students generally find journal-keeping a valuable experience, and many resolve to continue their journals beyond the end of the course.

IV

Because The Language of the Humanities is intended not as a content course but as a growth experience, there is little lecturing, much discussion, and no final examination. Student growth is best achieved in a non-threatening situation--one that elicits **genuine** responses without anxiety over whether such responses are correct or incorrect. If that situation is realized, students become contributors to each other's growth, by virtue of the diverse perspectives they bring to the subject or work of art under discussion. In 1984 and 1986, the classes included an artist, an art teacher, several other teachers, two librarians, a newspaper editor, a newly retired businessman, a computer programmer, and the wife of a corporate executive. Though so rich a mixture of students will not always occur, mutual enrichment is important to the course, and it is the instructor's responsibility to create a classroom atmosphere which maximizes that enrichment.

The enrichment sought in The Language of the Humanities is not measurable in an examination; it is something the student demonstrates throughout the course. Essays, essay revisions, journals, oral presentations, and class participation are sufficient bases for evaluating achievement. Nor are there pre-determined weights placed on the various assignments. One student's journal may deserve more weight than another's; the same may be true of the oral presentation. Students are credited with what they have achieved, whatever form that achievement may have taken.

Students responses to the course have been more than positive. They have been enthusiastic. But their satisfaction is derived, not so much from what the instructor has done for them, but from what they have done for themselves and for each other. The measure of success is not that students know more at the end of the semester (though, of course, they do) but that they have been transformed--that they are more reflective, more confident, more articulate, more human, more alive. The great joy of teaching this course is the witnessing of--and sharing in --that transformation.

HUMANITIES EDUCATION
CONNECTIONS

Ideas and materials for better teaching and learning in the humanities.

Ron Christenson

THE INTEGRATING OF THE AMERICAN MIND

We should not think it news to be told that a liberal education requires integrated learning. Allan Bloom in his best seller (**The Closing of the American Mind**) and the Carnegie report written by Ernest L. Boyer (**College**) are only the most recent authors to tell us that a genuine general education requires that our fragmented learning be re-connected. Both made news. Nor should we wonder that the re-connecting can best be done when we encourage our students to recognize that reading, thinking, writing, and talking are one integrated activity. The ancient Greeks knew it. Finally, I suggest that the great books offer a sound foundation for liberal education. That, least of all, should be news.

Let's begin with writing. Our students must first overcome the simple-minded assumption that essays, or any significant writing, are produced in two distinct steps: (1) thinking, during which the student does the research and organizes the ideas and materials, and then (2) writing, during which the student leaves aside all thinking in order to put words on paper. No such thing. Thinking and writing, re-thinking and re-writing, must be interwoven. Students might be encouraged to keep a journal of their ideas. Notebooks would do fine, but most students seem to think that the notebook is a place for the professor's ideas, or, lacking those, classroom doodles. Perhaps they should be disabused of such an image of their trusty notebook. The jottings can become the basis for a rough draft and can jog the mind to organize concepts. During the writing of a rough draft the student should follow new thoughts which lead in unplanned directions. Subsequent drafts can bring better order and phrasing, provided, that is, that all re-writing means re-thinking. Although word processors make tinkering, rearranging, and practicing surgery easy, no writer should miss the opportunity for re-thinking while re-writing.

Another mistaken notion is that writing is a skill. Spelling and grammar are matters of correctness, but writing is much more. As all Scrabble players know, errors in spelling can cause difficulties, but some writers are born spellers, some achieve spelling, and some have spelling thrust upon them. Only the middle group will gain from attempts to teach spelling. The others will find it a waste of time. Especially the third group must keep a dictionary within arm's reach at all times while writing. In any case, no excuses.

Grammar, like driving a car, can be learned by following the basic rules and developing a sense for when it is time to shift from present to past tense, how to take corners in subject-verb or pronoun-antecedent agreement without overturning, and when to slow down with a comma or come to a full stop with a period. Frequent mistakes include operating with dangling modifiers, speeding into run-on sentences, and driving through a plural with a possessive.

Once beyond the correctness of spelling and grammar, writing means learning to use the language to its full potential, a project for a lifetime of writing. There are few rules, but the great books provide models. Shakespeare gives us a sense for the rhythm of language; Edmund Burke can demonstrate how to master the long sentence, just as Alexander Pope, Tom Paine, and Emily Dickinson can teach us to be succinct. One does not read George Eliot or T.S. Eliot merely for a lesson in error-free writing. Their ideas and their writing are so linked that we learn style from them by paying attention to what they have to say.

Talking, the impromptu ability to express oneself, should be a goal of liberal education. I suggest that, whenever class size permits, the final exam should be an hour-long oral for each student. The oral final complements the essays. Where essays focus on one or a few aspects of the subject, allowing for analysis, the oral final encourages a comprehensive synthesis. If essays put a premium on re-writing and re-thinking, orals maximize the student's capacity to think while talking and to talk while thinking. Because oral exams promote integrative thinking, we should use them where we can. Students study for oral finals by looking for ways in which the various aspects of the material relate to one another, have significance for basic questions, and can be applied. The details are important, naturally, but not in themselves, isolated from a wider meaning. Details become key elements during an oral exam when the student can use them to illustrate certain ideas. The teacher will generally find that asking, "Can you give an example?," is the most useful and revealing question. At its best the oral final is a conversation.

Reading and thinking are stimulated by challenging and far-reaching questions. In the great books we find our most enduring questioners. The list of great books and authors is often called "the canon." The term is unfortunate if it carries with it the suggestion that such works are great because some Great Book Authority stamped them with the Great Book Imprimatur. It comes with the further suggestion that such books are read by insiders. Presumably, those who read the canon will become insiders. If that is why we should teach the Bible, Plato, Aristotle, and Voltaire, then I'll take my stand outside and say to my students, "Don't bother yourself with the canon--concentrate on your major and your textbooks."

It just so happens that two of the best features of the great books are: First , they are great not because an authority says so but because they raise questions that are important. Secondly, they are for everyone, not merely an elite, because they raise vital questions each of us should face.

Consider some of the questions. What causes war? I know of no one who gives that important question a more thought-provoking consideration than does Thucydides in his **History of the Peloponnesian War**. It is a complex history, full of detail, but running through Thucydides' story of the war is a simple theme: human pride has its consequences.

What is love? Charles Dickens wrote many novels, all with exceedingly complex characters and involved plots. His characters and descriptions of situations add up to a deep sense that, as Mr. Sleary said to the utilitarian Mr. Gradgrind in **Hard Times**: There is in the world a love which is more than self-interest. This simple idea takes shape only after we involve ourselves in the complexity of human motives, desires, and circumstances. Dickens gets us involved as well as anyone ever has.

What is justice? When faced with this question, it is hard to get beyond Plato's **Republic**, another complex book. Early in the book Thrasymachus enters the dialogue to argue that justice is nothing more than a word used by those with power to cover over their self-interest. Glaucon adds that, while we might behave properly, we really would desire to be unjust toward others. Socrates spends the rest of the book answering the challenges of Thrasymachus and Glaucon, demonstrating that not only is justice more real than our estimates of our self-interest but that we actually do desire justice, although we often don't quite know what it is.

What is peace? It is hard to imagine a clearer statement than the one offered in the **Book of Isaiah**. Israel was conquered by the Assyrian Empire. The prophet Isaiah then came forth with the vision of what peace means and what the future could be. The historical setting was complex, but the vision is simple: From the royal house of Judah, although it may seem to be in ruin, will spring an ideal ruler in the future. That ruler will have the gift of divine spirit and will not judge by appearances and heresay but with mercy and righteousness. He will bring equity to the poor and put the wicked in their place. Following the establishment of a reign of justice, human society will be regenerated and peace shall rule. That is a vision of peace, and it is simplicity itself.

We must distinguish simplicity from simplification. They are vastly different--opposites. From the slogans of television advertisements, which tell us we will find ourselves, our very souls, in our purchases, we know simplifications well. Simplicity is more difficult to come by. In reality, we probably must spend our lifetime developing our sense of simplicity by asking questions. What truth we know about the world emerges out of complexity. Simplification is a way of avoiding having to wrestle with the basic questions by seeking quick and easy solutions to complexity. Simplicity, found in myth, story, and symbol, presents us with infinite possibilities. Although simplicity might seem to result in relativism because it encourages a variety of interpretations, it is based on the healthy skepticism of Socrates who doubted every absolute answer but never doubted that there were answers. Simplification, ironically, seems to present answers, but, because it is mere ideology and slogan, in the end it is cynical, rigid, and leads to nihilism. The questions--among them, What causes war? What is love? What is justice? and What is peace?--are simple, but their answers require us to think. The danger is that we will be lured off the track by the attraction of the easy solutions contained in simplification.

It is the simplicity of the great books that opens them up to every serious person. But that, again, is no news. Socrates knew it and confronted the Sophists with questions which opened the walled knowledge of specialists and made way for integrated learning. Encountering these questions, thinking, writing, and talking about them brings us and our students into what Robert Hutchins called the Great Conversation. Leo Tolstoy told us, "Certain questions are put to human beings, not so much that they should answer them but that they should spend their lives wrestling with them."

BEST TRANSLATIONS

Yolande Jenny

VOLTAIRE'S CANDIDE

To pray or not to pray, depends on the translation.

Ever since its publication in 1759, Candide has remained Voltaire's most popular philosophical tale and translations of the text abound. As I teach Candide in English on an annual basis, I have become increasingly aware of the dilemma between the literal approach and the stylistic approach to translating, the difficulty of conveying the intent of the author as well as his distinctive style. This task becomes even more challenging when dealing with the subtleties of the ironic mode.

A particular passage of Voltaire's utopia, Eldorado, lends itself well to a stimulating class discussion and research on differing translations. In chapter 18, the author contrasts an ideal deistic religion to the organized religions of Europe and the Near East. Cacambo, who acts as Candide's mouthpiece in the particular episode, asks an old wise man about the religion of Eldorado. The response reads:

". . . nous avons, je crois, la religion de tout le monde; nous adorons DIEU du soir jusqu'au matin." (Literally: "We have, I believe, the religion of everyone; we adore GOD from evening until morning.")

But here are four published English translations:

"Ours, I apprehend, is the religion of the whole world; we worship God from morning till night." (Tobias Smollett, 1761-1765)

"We have, I think, the religion of everyone; we worship from morning till evening." (Donald Murdoch Frame, 1961)

"I suppose our religion is the same as everyone's, we worship God from morning to evening." (Robert Adams, 1966, reprinted 1985)

"We have, I think, the religion of everyone else; we adore God from evening until morning." (Ben Ray Redman, 1949)

"We have, I believe, the same religion as anyone else; we worship God, morning and night." (Lowell Blair, 1959)

The French quotation stems from the 1775 Cramer edition published in Geneva and verified by the author, so we may assume that Voltaire intended to insist on the word order of evening-morning, to portray Eldoradans who worship in bed in their sleep, i.e., who do not worship at all. Also, the definitive annotated modern edition in the Bibliothèque de la Pléiade lists no variant for the sentence quoted above.

Although, according to a recent survey by Renée Waldinger, Donald Frame's English version is favored for its stylistic qualities, in this particular passage, it seems to miss an important point and it does not adequately convey Voltaire's wit and irony. I presume that since Voltaire did not believe in a personal relationship between the Creator and human beings, he deliberately reversed the expected word order of "morning until evening" in order to either dismiss any form of prayer and worship, or to better ridicule, by implication, the formal Christian and Muslim methods of prayer and worship, in daytime, in specially designed buildings. A statement in the article on Theist (Voltaire's **Philosophical Dictionary**) supports the theory of absence of formal worship in Eldorado: "To do good---that is to worship, . . ."

Since several translations repeated the same error, one may wonder to what extent the authors consulted each other's translations. Or did any of the translators assume there was a typographical error in the original French text? Or did they assume that daytime worship services are held in Eldorado? Or did they simply and correctly interpret Voltaire's phrase to mean that all human activities, at any time of day and night, can glorify God?

In conclusion, and after verification of the original French text, I can only disagree with the wording of Smollett, Frame, Adams and Blair. However, in regard to Voltairian narrative, the greatest of sins is not a mere mistranslation, but rather the failure to convey the philosopher's all-pervasive wit and irony.

Call for Articles

EXPRESSIONS OF THE SELF

The Fall 1988 issue of HUMANITIES EDUCATION will be devoted to the theme of Self-Expression, including such topics as autobiography, self-portraits, self-expression in music, poetry, architecture, crafts--whatever. This issue will also include selected color slides from the collections of the Minneapolis Institute of Arts with informational notes and ideas for teaching.

As always, articles should relate to interdisciplinary humanities learning. In addition to longer articles (see Editorial Policies page), we like to have relevant reviews, abstracts of journal articles and short pieces describing classroom activities, museum exhibits, favorite documents and artifacts, etc. Selection of articles will be influenced by the need for balance among our many constituencies as well as the usual factors in accepting articles for HUMANITIES EDUCATION. The final deadline for acceptance of completed submissions is May 15, 1988. Send to the Special Issue Guest Editor:

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

NOTE: Because we have an extended essay reviewing computer programs for humanities writing and research, this issue does not have abstracts of articles from journals. Abstracts will return in the Summer issue. If you are interested in contributing abstracts of articles, send a sample to the editor, Fred Schroeder. Readers are also invited to serve as reviewers of books, texts and other resources. Write for guidelines to Dr. James Mehl, Book Review Editor, Humanities, Missouri Western State College, St. Joseph MO 64507-2294.

Charles Ess

Electronic Scholarship: Programs and Resources

Within just a few years, computer technology has become central to the tasks of humanities scholars and educators. The microcomputer is now used by the majority of humanities scholars as a writing and research tool. It is now commonplace for conferences and publishers to accept papers and other scholarly documents in electronic form -- e.g., as a wordprocessing document stored on a disk. (HUMANITIES EDUCATION welcomes manuscripts with disks in *WordPerfect*.) And it is no longer unusual for scholars to communicate by way of networks such as BITNET or ScholarNet. The literature of academic computing alone now fills at least three major journals, scads of books, and a virtually unlimited number of smaller newsletters and discipline-specific journals. To be an electronic scholar (i.e., one who makes use of the new technology in teaching, writing, and research) virtually requires becoming a scholar of this peculiar mix of literature, software, and hardware.

For my colleagues who struggle, as I do, with attempting to exploit the new technology in teaching and writing, I offer the following observations, first of all, on current, top-of-the-line wordprocessing packages. In addition, I will provide an overview of resources on academic computing which I have found helpful.

Word Processing

Wordprocessing remains the major academic use of the computer--and with good reason. Wordprocessing packages offer academics exquisite control in their writing--beginning just with editing, filing and storing documents. As well, the more powerful programs offer the user such features as: spelling- and style-checkers, and "on-line" thesauri which can be called to the screen and used while working in the original document; automatic formatting and numbering of footnotes and endnotes; automatic generation of tables of contents, bibliographies, and indices; outline generators for creating and writing under outline headings, and which automatically renumber headings as headings are reorganized; style sheets which automatically set margins, spacing, indentation, location of page numbers, etc., as defined by the user or by a standard style manual; programming languages, "macros," and phrase libraries allow users to enter frequently used words or phrases with a keystroke or two, and to automate common procedures such as calling for file listings; the ability to incorporate foreign language characters and graphics within a text; and, in the case of Nota Bene, the wordprocessing program works with a "text-base" system for storing, searching, and retrieving research notes.

All good wordprocessors accomplish the same basic tasks; they are differentiated primarily in terms of "user-friendliness" and specific strengths. Which wordprocessor is best for any given academic writer depends on two things: one, what she or he really wants a wordprocessor to do, and two, how much effort he or she is willing to put into learning the program. Generally (though this is no longer a hard and fast rule), either programs are easy to learn and use (while slow in execution, limited, and inflexible) or they give the user great control, flexibility, and speed (while being comparatively more difficult to learn, if not use.)

For example, both Microsoft **Word** (hereafter referred to as **Word**) and **Nota Bene** offer style sheets which control many formatting details. **Nota Bene**, however, not only provides the same option as in **Word** of creating one's own stylesheets; it further includes stylesheets designed according to the requirements of the MLA, the APA (American Psychological Association), the **Chicago Manual of Style**, and the **Turabian Manual for Writers**. In addition to controlling formatting details such as margins and line spacing, **Nota Bene's** style sheets, when appropriate, further prompt the user through the process of creating the proper cover page, abstract page, etc. Given that one frequently submits articles to journals with differing style-manual requirements, and given that one is willing to undertake the additional effort required for learning a somewhat more difficult program, **Note Bene** is a dream come true. Other writers with little or no need for this feature will find **Word** or **WordPerfect** to be perfectly satisfactory -- and somewhat less difficult to learn.

Or, as a second example, **Word** will create up to five levels of subheadings in an index -- but the program is limited to one index per document. **Nota Bene** is limited to three subheadings per index -- but it can create up to three indices per document. **WordPerfect** can "only" generate one index per document with "only" one level of subheadings. Clearly, the writer who routinely creates documents requiring sophisticated indices will need to learn **Word** or **Note Bene** -- depending, finally, on what sorts of indices she or he is likely to need. By contrast, the writer who rarely, if ever, creates a document requiring an index will be satisfied with **WordPerfect** or **Word**.

Further, it may be helpful in considering this issue to think of the computer **qua** wordprocessor as somewhat analogous to the printing press. Like the printing press, the computer as a tool for writing and scholarship offers exciting new possibilities for creating and distributing texts. Academicians facing the prospect of using a computer as a tool in their work might ask themselves how they would respond to the invention of the printing press. Upon hearing the news, some of us, while eager to get our writing into print, would happily let someone else actually set the type and worry about the details of font size and spacing, margins, "gutters," etc. Others of us would get our hands on a press as quickly as possible and learn how to set our own texts. Those of us from the first group might likewise be more content with a wordprocessing program that is easier to use because it has the computer attend to many of the details. By contrast, those of us in the second group will only be satisfied with more complex programs as they let us do more and give us greater control over the text-creation process.

At the same time, however, scholars inclined to place themselves in the first group should further keep in mind that after six months or a year, the features that make the program easy to learn may also make the program cumbersome or unusable in the face of more exacting tasks. For example, **WordPerfect** is one of the easier programs to learn. But this ease of use also makes it seriously limited for the academic writer. Like the other wordprocessors, **WordPerfect** automates the production of footnotes and endnotes -- i.e., it will automatically number and format such notes, automatically renumber and reformat notes when changes are made, etc. To generate endnotes, the program "dumps" the writer's notes at the end of the document. This will do nicely for many documents, including chapters in a book or dissertation. But in the case of the scholarly paper which must also include a bibliography, a "Works Cited" page, acknowledgments, and other end matter after the endnotes, **WordPerfect** becomes unworkable. Because **WordPerfect** will dump the endnotes only at the end of the document -- if you want to include end matter after the endnotes, you must either create two files (one with the original document and endnotes, and a second file with the end matter) and paste the two together in printing; or you simply enter the endnotes manually in the document where desired -- which means sacrificing the original advantage of the wordprocessor, namely automatic numbering and formatting. Neither solution seems satisfactory for the academic writer who will write lots of documents with endnotes and accompanying end matter. In the long run, she or he would simply be better off beginning with the somewhat more complex -- but more flexible -- **Word** and **Nota Bene**, which give the user very precise control over the location of endnotes, and thus lets the user easily include other sorts of end matter.

A final point: precisely because these programs are so powerful, they are made up of very long files. (The "LEX.WP" file, for example, which is used in the spelling checker of **WordPerfect** alone fills up one 5.25"/360K disk.) While each program can be used as distributed over several 5.25" disks, this approach requires considerable "disk-swapping" -- for example, when one wants to activate the spell-checker or other ancillary features. Users with access to 3.5"/720K disks will be less constrained in this regard. But using a hard disk is most efficient, both because the hard disk is much faster than floppy drives, and because the hard disk provides for more than enough room to store the programs and text files.

Given these considerations, I offer the following comments on these three top-of-the-line wordprocessors (all are for IBM/compatible machines). Rather than attempting to provide a complete overview of each program, I focus instead on the most apparent strengths and weaknesses of each which I take to be of primary interest to humanities scholars. (Interested readers will also want to see the comprehensive review of wordprocessors recently published in **PC Magazine**, Feb. 29, 1988. Out of a field of 55 programs, the three reviewed here -- along with two others -- emerged as "Editor's Choice." See pp. 344f.)

WordPerfect (4.2); Microsoft Word (4.0); Nota Bene (2.0)

WordPerfect (hereafter referred to as **WP**) is quite easy to learn and use, thanks to an exceptionally clear documentation manual and the generous use of menus and "on-line" help screens to guide the user through most operations. In fact, the help screens are one of the most useful features of the program: they can be displayed on the monitor without losing the document you're currently working on, and they are sufficiently clear that further inquiry in the manual is rarely required.

Most of the common operations in **WP** -- as in **Word** -- are carried out primarily by executing combinations of function keys and "Control," "Alt," or "Shift." This approach contributes to the program's ease of use -- though it also imposes limits on the program. (There are only so many possible key combinations, so that the number of possible operations tied to key combinations is relatively limited. By contrast, **Nota Bene** executes most operations through a "command line." This means that the user must move the cursor to the command line at the top of the screen and enter an abbreviated command -- which further requires the user to remember the abbreviation. This approach overcomes the intrinsic limits of the **WP** strategy -- but even with **Nota Bene's** excellent help system, such an approach initially makes more demands on the user.)

The program's ease of use and power extend to its speller and thesaurus. These functions can be accessed at any point during the creation of a document, so as to check spelling or suggest synonyms for a particular word. In addition, the speller will proof and identify misspellings throughout a paragraph, page, a defined block of text, or the entire document.

Several other features of **WP** have made it a favorite among the scholars I know. These include its ability to create "macros" -- specific keystroke combinations which

926

one uses frequently, as in typing a name or term, or in performing a sequence of operations, which are then "memorized" by the computer and saved for future use. As well, an additional program called **WordPerfect Library** integrates with the program to make such DOS-related functions as copying and deleting files, etc., somewhat easier. Finally, the program comes with an exceptional range of printer drivers (i.e., the files needed to properly match the texts created within the program with the commands recognized by specific printers), virtually assuring a match between the program and whatever printer -- including Hewlett-Packard and Apple laser printers -- that one may have.

WP includes a number of other features of value to scholars, including the ability to generate tables of contents, indices, and bibliographies automatically. Its power and ease of use make it a popular choice for academic writers, and the **WP** format for documents is frequently one accepted by editors and publishers. **Purchasing information:** Finally, the program offers two advantages in terms of price. One, while listed for $450.00, it is available at an educational discount for $125.00, with additional discounts for volume purchasing. Two, a restricted version of the program is bundled with other software (a database and a spreadsheet program) as part of a reasonably priced text and lab manual package from McGraw-Hill for courses in microcomputer applications. For information on the text (Microcomputer Applications, by Robert T. Grauer and Paul K. Sugrue) contact McGraw-Hill: tel. 800-624-7294. For more information on **WordPerfect** and the educational discount, contact: WordPerfect Corporation, 288 West Center Street, Orem, UT 84057, tel. 801-225-5000.

Despite its many powers and graces, however, **WP** is by no means perfect. Beyond its inflexibility in producing endnotes, the program is marred by two further flaws. First, one of the most basic operations in wordprocessing is the process of defining a block of text and then either deleting it and/or copying it to another location in the document. This procedure is more awkward than most others in **WP**. And, because it requires working through two different menus, it is especially cumbersome compared with the equivalent procedures in **Word** and **Nota Bene**, which allow the user to drop the menus once she or he becomes familiar with the appropriate commands. Precisely because this is a basic operation, for it to be somewhat clumsy is a serious drawback. Moreover, the program limits the user to working with two documents at any given time. The ability to read and work with two documents may be sufficient for many users -- especially keeping in mind that the program allows you to temporarily shift from the open documents to look up words in the speller and/or thesaurus, and to look up files on a disk or subdirectory. But for those users who may want to look at and work with more than two documents, the two "windows" in WP will not suffice. For example, if a scholar wanted to see the use of a word or phrase in, say, six or eight distinct texts -- the ability to display all these texts on the screen at once would be useful indeed. Such scholars will want to learn either **Word** or **Nota Bene**, which allow the user to open, display, and edit up to eight documents in individual windows. More generally, these programs also give the user more extensive control over editing and formatting texts.

Word 4.0 closely approximates **WP** in terms of ease of use and power. **Word** offers the same sorts of more advanced features -- speller, thesaurus, and automatic generation of tables of contents and indices. Its documentation rivals **WP**'s in clarity and organization. And its help facilities, including an on-screen tutorial, are at least as useful as those in **WP**. Unlike **WP**, however, **Word** can be used in conjunction with a mouse, which for many users -- especially students -- seems to make the program more user-friendly.

Indeed, **Word** is more powerful and easier to use than **WP** in a number of ways. For example, the procedure for copying text is both more straightforward and more flexible. Once a block of text is defined (by using the Shift key or function key F6 in conjunction with arrow and other direction keys), the user hits "Escape"; this brings up the main menu, and the user hits "C" (for Copy). Unlike **WP** and **Nota Bene** which allow the user only the possibility of copying the blocked text to one temporary "buffer" in memory, **Word** gives the user the choice of copying the blocked text to a "Scrap" buffer, or to a new file contained in what is called the Glossary. (An additional advantage here is that **Word** displays the beginning and ending characters of what is in Scrap at the bottom of the screen. The related operations in **WP** and **Nota Bene** assume that the user can remember what he or she has just cut or copied. But in practice this is not always a reasonable assumption, especially if one is editing complex documents.) The user can then relocate the cursor whither she or he will and dump the contents of either the Scrap buffer or the temporary files in the Glossary. This means that in **Word** you can "copy out" a number of different pieces of text in one location of a document before relocating them elsewhere. With the one buffer allowed for by the other programs, such editing would require a more laborious procedure of marking, copying, relocating, and dumping the buffer for each piece of text one wants to copy.

Word sports other nice touches. It gives the user more control over screen display--including display of the menu, screen borders, etc.. The user can further shift from a text display to a graphics display which, given the appropriate hardware, shows the effect of formatting commands (e.g., bold text is brighter, underlined text is underlined, and italic text appears as italic.) An especially useful feature is the summary sheet. Summary sheets are small files which **Word** appends to each text file. The summary sheet for a given text file acts as an index card which allows the user to enter a considerable amount of information about the file such as title, author, version number, creation date, revision date, comments, and "keywords" -- i.e., indexing categories. The summary sheet (like the document summary feature in **WP**) thus provides a much more complete description of the file than the often cryptic DOS names (which are limited to 8 characters and a 3-character extension). In addition, **Word** (unlike **WP**) uses the summary sheets in an indexing system which allows the user to search for documents in both simple and relatively sophisticated ways. For example, you can instruct the program to find all documents marked by one keyword (e.g., "romanticism"). Or, using parentheses and Boolean operators (OR, AND, NOT, and for dates, LESS THAN and GREATER THAN), you can initiate a more complex search -- say for any documents marked by the keywords ("romanticism" OR "Kant") AND written after June 24, 1985 (i.e., with a date GREATER THAN 6/24/85).

Word's power and flexibility is further apparent in the sorts of formatting tasks especially called for in the use of laser printers. (**Nota Bene** gives the user at least as much control over page formatting and the fonts -- e.g. bold, underlined, italic, and specific sorts of printers fonts -- and pitches -- "expanded" or 5 pitch, pica or 10 pitch, elite or 12 pitch, etc. -- in which characters or lines will be printed. **Word** does so, nonetheless, in what is at least initially a somewhat friendlier way.) This orientation towards laser printers, however, is tied to my one serious reservation about **Word**; the majority of printer drivers supplied with the program are for laser printers, and the number of drivers for the more usual dot-matrix and daisy-wheel printers is limited, especially in comparison with **WP**. (My thanks to Rev. Peter Sawtell, Co-Pastor of First Congregational Church in Sioux City and adjunct instructor in the Religious Studies Department of Morningside College, for introducing me to **Word** 4.0 and guiding me through some of its complexities.)

Purchasing information: Like **WP**, **Word** is available at a steep educational discount from its $450.00 list price -- for $125.00 (when purchased in orders of at least two units) . For more information, contact: Microsoft Corporation, 16011 NE 36th Way, Box 97017, Redmond, WA 98073, tel. 800-227-4679.

Overall, **Word** provides the writer with more control and flexibility than **WP** -- but is at least as easy to learn and use as the latter. Nonetheless, **Word** is not the last word (!) in wordprocessors. Rather, **Nota Bene** 2.0 (hereafter referred to as **NB**) remains the premier program for writers and scholars.

NB, in fact, can be characterized as the scholar's complete toolbox, insofar as it provides the academic writer with what is arguably the best wordprocessing package around -- coupled with a powerful "text-base" program that exploits the computer's capacities for sorting, organizing, and retrieving information. The text-base program is essentially the equivalent of index cards (called "records") in a shoebox. But in contrast with many database programs which limit the length of records, in **NB**'s electronic shoebox, records can be as long or short as the text one wishes to quote or comment on. The index keywords can be determined by the user -- or documents (such as letters, papers, notes, etc.) can be indexed through a "every word as keyword" approach. Finally, because the text-base works in conjunction with the wordprocessor, records can be searched and, if desired, inserted into a document quickly and easily.

NB is also unrivaled in its ability to incorporate "graphics" characters -- including the accent marks and characters of Western European languages, as well as many Greek symbols -- in a text. **Word** and **WP** require the user to know the ASCII code numbers for such characters, and then to enter these numbers after a special combination of keystrokes; alternatively, the user can set up macros (in **WP**) or glossary files (in **Word**) which will partially automate this process. By contrast, **NB** provides the user with a total of eight "keyboards," including a keyboard with Greek and Western European characters. Each keyboard is accessed by pressing some combination of the "Alt," "Ctrl," "Shift," "Esc," and "Capslock" keys; a template accompanying the program clearly labels each keyboard and identifies the effects of particular keys within a given keyboard. To get to lower case Western European keyboard, for example, one holds the "Alt" and "Ctrl" keys; to type an "a" with a German umlaut then simply requires pressing the "Q" key. Logically enough, the upper-case Western European keyboard is accessed by the same combination plus the "Shift" key. Alternatively, users may choose software-defined keyboards for Western European languages to be set up as their usual or "default" keyboard. Or, with a bit of work, users may redefine the keyboard so as to provide still readier access to frequently used foreign language characters. Finally, additional language modules allow wordprocessing in Hebrew (including the appropriate right-to-left wordwrap), Greek, Cyrillic, Old and Middle English, and still other languages.

Even those of us who have little need for foreign language text processing or research text-bases will find **NB** to surpass other wordprocessors on almost every point. As a simple example, the program provides for the most flexible and powerful cursor moves and deleting functions of any wordprocessor I know. The "Alt," "Shift," and "Ctrl" keys are used in conjunction with arrow keys (for cursor control) and the "Back Space" key (for deletions). The arrow keys and "Back Space" will move the cursor or delete, respectively, one character at a time. Used in conjunction with the "Ctrl" key, the cursor moves or deletes one word. In conjunction with the "Shift" and "Alt" keys, the cursor moves or deletes one sentence or paragraph at a time, respectively. Such an elegant arrangement for such basic operations means greater speed in many editing procedures. More generally, in **PC Magazine's** "benchmark" comparison of **WP**, **Word** 4.0, and **NB** -- with one exception, **NB** performed standard wordprocessing operations as fast or faster (often by three to ten times faster, and occasionally 20 to 70 times faster!) as its competitors. (The one exception was in time required to print a 50K document to a RAMdisk. **Word** required 35 seconds, **NB** required 5 seconds, and **WP** required 2 seconds; see "Performance Tests," **PC Magazine**, Feb. 29, 1988, pp. 280-290.)

While the "command line" structure of the program makes it somewhat more demanding on the user, **NB**'s help system makes the program only somewhat more difficult to use and learn as its less complex counterparts. Its help system is comparable to the systems provided with **Word** and **WP**. In particular, the **NB**, like **Word**, incorporates an extensive series of optional menus which guide the user through most procedures. For example, if one wants to save a file, but has forgotten the proper command, she or he can simply press function key F6. A basic menu appears across the top of the screen: the user then selects the "INFO" option. A prompt screen appears and asks you to type in the concept or topic for which you desire help. By typing "save," the user gets a second prompt screen which asks for the name of the file to be saved. Once this is typed in, the program automatically executes the procedure. These help functions are especially useful when first learning the program, and they are always available to remind experienced users how to get through forgotten procedures and commands. But these helps are optional and thus can be bypassed by more experienced users. They hence do not become irritating and time-consuming constraints as do the menus of other programs which always force the user to work through a series of choices before arriving at the particular operation he or she wishes to execute.

Perhaps the most serious drawback to **NB** 2.0 is the lack of a speller and thesaurus. Happily, this will be overcome with the release of **NB** 3.0 this spring.

Purchasing information: Less happily, because **NB** is a product designed primarily for academics (so that it has a more limited market), and because it simply does more than the other programs, it is not so sharply discounted. Still, persons who purchase **NB** in quantity (either through Dragonfly Software or a dealer) or through the MLA (which has endorsed the program) enjoy a considerable discount from the $495 list price. MLA members pay $375, and graduate students pay either $275 (MLA members) or $285. Inquiries should be addressed to: Stephanie Monka, MLA, 10 Astor Place, New York, NY 10003. For more information, especially regarding group discount prices, contact: Dragonfly Software, 285 W. Broadway, Suite 500, New York, NY 10013, tel. 212-334-0445.

Academic Computing -- Additional Resources

Scholars interested in expanding their use of the computer in their writing and publishing activities face no shortage of useful programs and pertinent literature. For example, in 1987, the University of Chicago Press published **The Chicago Guide To Preparing Electronic Manuscripts: For Authors and Publishers**. My colleague John Lawrence describes the book as the result of the Press' editorial staff experience with authors' initial efforts to submit manuscripts in electronic form. Out of this experience, the new handbook "is simultaneously an attempt to define the electronic manuscript and to set some guidelines for the electronic behavior of authors who deal with the vast University of Chicago publishing enterprise." ("Electronic Manuscripts in the Midwest or When Chicago Talks, People Listen," **Research in Word Processing Newsletter**, Dec. 1987: 2.)

In the face of a variety of wordprocessors, each of which creates documents in a format which only the program itself can properly read, the need for such guidelines is very real. Indeed, as Professor Lawrence further points out, to impose order upon the chaos of manifold wordprocessing formats, Pergamon Press has taken a still more radical step. Pergamon has gone so far as to create its own wordprocessor -- **Manuscript Manager, APA Style**, for both Apple II and IBM/compatibles -- and to require authors to submit their manuscripts as created within **Manuscript Manager**. More generally, authors and publishers who struggle with converting documents from one format to another long for a "generic" wordprocessing format as a universal standard for documents. IBM's DCA (for "Document-Content-Architecture") format is now available with some wordprocessing packages -- including the new **Nota Bene** 3.0 -- as a format into which the program can subsequently "translate" a document created within the program. Whether DCA -- or a format resulting from the Association of American Publisher's Electronic Manuscript Project -- will in fact emerge as a standard format remains to be seen.

A number of journals and newsletters focus specifically on wordprocessing and other computer uses in the humanities. As an initial instance, Professor Lawrence's review was published in the **Research in Word Processing Newsletter**. Edited by Bradford A. Morgan and James M. Schwartz, the **Newsletter** is published nine times a year by the South Dakota School of Mines and Technology; each issue includes an extensive bibliography on recent publications in wordprocessing, desktop publishing, the use of computers in writing instruction, etc. A subscription is $18.00/year. Inquiries and manuscripts should be addressed to the Editors, **Research in Word Processing Newsletter**, SDSM&T, 501 E. St. Joseph, Rapid City, SD 57701-3995.

Bits and Bytes Review is devoted exclusively to reviews of computer hardware and software of interest to academics. I have found the reviews to be among the most extensive and detailed available. Faculty subscriptions are $55.00/year; institutional subscriptions are $70.00/year. Subscription inquiries may be addressed to: BITS & BYTES COMPUTER RESOURCES, 623 North Iowa Avenue, Whitefish, MT 59937. Tel. 406-862-7280.

Paradigm Press publishes a number of journals and newsletters. Journals include **Computers and the Humanities**, published quarterly for $89.00/year for institutions and $25.00/year for individuals. This journal reports on research and applications of computers in humanities disciplines, and includes book and software reviews. **SCOPE: Humanities Computing Update** and **disSCOPE** (a disk version of the former, utilizing a menu system for access to selected items), also published by Paradigm, are newsletters which provide annotated overviews of recent software, courseware, hardware, databases, networks, and publications; bibliographies of software and hardware reviews; brief articles, announced calls for papers, a "Campus News" summarizing recent events and accomplishments in academic computing, and a calendar of upcoming events. **SCOPE** is published six times a year: institutional subscriptions are $52.00, and individuals may subscribe for $25.00 per year. Address: SCOPE, P.O. Box 1057, Osprey, FL 34229-1057.

Scholars will be glad to know that two journals may be had gratis for qualifying subscribers. **Technological Horizons in Education Journal**, published 10 times yearly, features two or three significant articles on applications of computer technology in education, from K-12 through higher education; the articles are especially helpful insofar as they focus less on technics and more on pedagogical aims and experience. The articles can be found hiding among lots of product announcements and advertising (which are not necessarily unhelpful). Address inquiries to: T.H.E. Journal, Box 15126, Santa Ana, CA 92705-0126. A second journal which contains still more articles is **Academic Computing**. Restricted to computer use in higher education, the journal is published 9 times yearly. Requests for free subscriptions should be directed to: Permissions Manager, Academic Computing, P.O. Box 804, McKinney, TX 75069.

BLOOM AGAIN

Allan Bloom, **The Closing of the American Mind.** New York: Simon & Schuster, 1987. 432 pp. $18.95. Reviewed by Sharon Scholl, Jacksonville University.

By now Bloom's book has about been reviewed to death. What is important here is to consider the implications of the work for liberal arts in general and humanities in particular. A necessary prelude is to consider carefully the predispositions of the eyes through which American higher education is regarded. Bloom has been bitterly and permanently affected by the violence and capitulations to what he regards as ill-founded student demands which transpired on the Cornell University campus during the Sixties. He is profoundly European and Classical in his outlook, regarding contemporary life as a tangled thicket stretching from Locke to Rousseau. He finds American thought standing about in rags feeding on the remains of Nietzsche and Heidegger (and unaware that it is doing so). He especially decries "value relativism" and the American sense that we have nothing important to learn about life from the past. His heroic paradigm is Socrates. His outlook is completely literary and specifically philosophical (the issues, "enduring questions" are what education is about). He adopts the Enlightenment definition of the university as a free agent established to examine (and probably reject) the uncritical mass assumptions of public opinion. In summary, these are the glasses through which he regards the world, denigrating other styles of glasses such as economic patterns (Marx) or instinctual urges (Freud).

The student population upon which his observations are based are, admittedly, not that with which many of us work. He may find "their gratitude at learning of Achilles or the categorical imperative is boundless" (p. 344). The students I know anything about regard both these matters as untoward obstructions in the path leading onward to their true purpose--the gaining of a semi-honest buck. Yet in another passage he admits, "It is much more difficult to attach the classic books to any experience or felt need the students have." Now he's talking!

933

The bulk of the book is a detailed description of the ailments of higher education, which are symptomatic of general disease in the culture. The main ones include the following:

1. We are victims of "indiscriminateness" allowing anything because somebody somewhere does it. We need to justify and rationalize our ways and values, not abandon them.

2. We are cynical about our leaders and our heritage. We have lost the broad human connections we used to get from the Bible.

3. The greatest danger in a democracy is, as de Toqueville asserted, enslavement to the mass mind, to popular opinion. Democracies hate elitism in every form, demanding concentration on the useful. Universities are a genuine counter-culture, and keep forgetting this role. The old enemy of the university was the dead hand of revealed religion; today it is the mass mind with its blanding out of all values. Just as Heidegger in 1933 capitulated to becoming a servant of National Socialism, so the modern university has capitulated to democratic "civil society".

4. The Sixties witnessed the "dismantling of the structure of rational inquiry" and giving up decisions about value to the mob. The distinction between educated and uneducated was leveled so that popular culture is all that is now influential on our scene. The hero is the hedonist who acts out his private fantasies in public.

5. Traditions absolutely necessary and not simply the burden of an outworn past. Tradition provides "models of discussion on a high level." It provides models such as Cyrus, Romulus, Moses, rather than Wall Street financiers and TV personalities.

To focus more specifically upon material intimately involved with instruction in the humanities, Bloom devotes a substantial chapter to the problem of music. He contends that pop music is the one passion of the young and their almost exclusive form of spiritual nurture. Because of the failure of the family and the loss of attachment to religious institutions, rock music is to a large extent the only moral education of our young. "Rock music provides easy, premature ecstasy and without effort, talent, virtue, or exercise of faculties." (p. 81) It presents a "worldview balanced on a sexual fulcrum." If education is the taming of the soul's raw passions, pop music is the celebration of them. I personally believe there is some truth in this. I am constantly aware that in assigning my students to listen to any music at all (even the folk music of other cultures) I am asking them to commit an act of unconscionable disloyalty to the one universe of value they have been sold since they were children with every wile of the advertiser's art. And where has music in grades K-12 been all these years? Why don't these people have any other traditions from which to draw meaning?

Indeed, Bloom is ready to dismiss all education before the college level in his assertion that "University years are civilization's only chance to get the student." (p. 336)

But college curriculum is in such disarray that he sees little possibility that civilization will add many recruits. There is, as we are painfully aware, no agreement about what an educated person is or how higher education is to produce such a thing. So students sign up for some narrow specialty where at least there is a sense of control and outcome. Liberal education of the sort Bloom is interested in has no prestige in the world today. And this niche is, of course, where we find the humanities.

What is to be done, and where do the humanities come in? After 371 pages we get to his tired old solution: return to the Great Books curriculum. He is not without sympathy for courses which attempt large syntheses of texts of many kinds based upon such themes as "Man in Nature," "Arts and Creativity," etc. But he suspects they are trendy, popularized, made up of bits and pieces, and "lacking rigor." He believes small, detailed issues are better, leading to larger questions and other studies, and giving competence in specific (undoubtedly literary) works. So we come out with exactly what he complains of in higher education--the lack of a concrete vision around which a coherent curriculum could be built. However, this lack is an important concern, reflecting a deeper crisis in our civilization and not merely an institutional glitch in administration.

Humanities may well be the one area of the curriculum where value questions still have importance, where the mass mind is still subjected to criticism, where the university is living up to Bloom's assigned role in a democracy. No wonder it is such uncomfortable territory. To point students, against the grain of their culture, toward the earned elitism of taste and intelligence is a dangerous kind of work. America clearly doesn't want it done, but we are here to do it and bear the consequences. Bloom promises only the occasional reward, that sometimes a student will perpetuate our values and validate our perceptions.

OUR CULT

Cultural Literacy: What Every American Needs to Know, by E. D. Hirsch, Jr. (Houghton Mifflin Co., 1987)
Review by Sharon Scholl

Described on the dustjacket as a "national bestseller," Hirsch's prescription for American education is interestingly argued and bafflingly detailed. The thesis, in brief, is that only by advancing from basic verbal literacy to cultural literacy (participation in a shared universe of information) can a student thrive in the modern world. Cultural literacy refers to that huge body of assumed understanding which lies under our conversations and varied recorded expressions of meaning. The complexity of that assumed knowledge has been rising steadily, but students' ability to cope with this body of symbols and allusions has deteriorated. Hirsch blames the educational assumptions derived from Rousseau for much of the damage. Students are far from culturally illiterate, but very much of what they know is ephemeral and shared only within their narrowly defined generation. In order for a society to hold together, it must share a broad range of intergenerational information. Our public documents and media presentations assume a large audience of persons who know things also known by all other literate people in the culture. Without that broad base of shared reference points, elements of a culture break apart into their individual ghettos of discourse.

The second most important point Hirsch makes is that this broad base of understanding is not merely absorbed by the young from surrounding, more experienced humans as a matter of course. It may once have been so in rural, tribal societies, but no longer. Contrary to past educational theory, cultural literacy must be taught directly; it is deliberately sustained by national systems of education. This does not make cultural literacy conservative or class-bound, in Hirsch's opinion. It is open to change; it is truly democratic, excluding no class or age group. It has been so taken for granted that only now when we recognize its absence in a significant segment of our youthful population do we grow anxious as to where and why it has disappeared and wish to reinstate it in some form.

Hirsch argues further that a shared cultural literacy serves as a form of social protection. The more specialized and technical our civilization becomes, the harder it is to avoid being manipulated by practitioners of arcane specialties. Maintaining a broad base of cultural literacy out of which everyone must speak to everyone else is the appropriate antidote to this dismal future. The lack of a national agenda for the acculturation of the young and the resulting incoherence of our patchwork of local curricula bodes ill for accomplishing this essential task.

Much of the book is devoted to the results of studies of educational attainment and a review of the swing of educational theory and practice in the United States. But more to the point of what the book suggests for those of us in the humanities disciplines, Hirsch does produce an enormous appendix listing some major items every american should know about by the time he completes high school. (Unfortunately Hirsch does not assume students must have first-hand experience of reading, hearing, or seeing these items, but only that they know what the people, objects, and concepts listed are generally about.) Supposing we were to take this list as an instructional curriculum guide for secondary school humanities courses based on a Western culture-history model, what would we teach? I went through the entire two column sixty page list extracting items that might constitute a humanities course and rearranging them into culture eras. The result was far too expansive and detailed to be crammed into a book review; a sample must serve.

What should a high school graduate know in the humanities realm about this century in which we live? One should know about abstract expressionism, impressionism, cubism and surrealism and these individual artists: Calder, Cassatt, Cezanne, Dali, Degas, Walt Disney, Grandma Moses, Matisse, Picasso, Pollock, Wyeth, the architecture of F. L. Wright and the Brooklyn Bridge. This is a great deal more justice than is done in any other era. The total list is so heavily literary that it nearly disparages any other form of human discourse. For example, the huge treasure-house of Greek art is dismissed with three entries: the Acropolis, Parthenon, and Doric Order.

Musicians constitute a more peculiar list. (He lists no major works a student should be familiar with, as is true of visual arts.) There are: Louis Armstrong, the Beatles, Irving Berlin, Caruso (why not Pavarotti?), George M. Cohan (no Aaron Copland, for pity's sake!), Duke Ellington, Gershwin, Scott Joplin, Cole Porter, Prokofiev, Puccini, Richard Strauss, and Stravinsky. In general, it is a mongrel mixture reeking of anti-intellectualism. The full appendix is peppered with "classic" songs he believes everyone should know, such as "On Top of Old Smokey," and "Sweet Adeline." This seems more like the perpetuation of Boy Scout Camp memories of some middle-aged sentimentalist than a really objective compilation of music that deserves to be part of a national cultural literacy.

Hirsch does much greater justice to literature, listing writers and works that most scholars would agree deserve a place in American culture. There are: **Babbitt**, Baldwin, **Catch-22**, **Catcher in the Rye**, Cather, Agatha Christie, Conrad, Cummings, **Death of a Salesman**, **A Doll's House**, Dos Passos, Eliot, **The Invisible Man,** Faulkner, **The Great Gatsby**, Frost, Harte, Hemingway **(The Sun Also Rises)**, both Huxleys James, Kafka, Lawrence, Lewis, Mailer, O'Neill, orwell, Spender, **Our Town**, Sartre, Shaw, Stein, Wharton, Wilde, Yeats.

Film takes up significant space in the listing, having such entries as: **Birth of a Nation**, Chaplin, Garbo, Griffith, Hepburn, Monroe, and Mae West (evidently ephemeral sex goddesses of the middle-aged are "classic" and memorable, but those of the young - Madonna -are hardly worth the list). Oh yes, dancers Nijinsky, Astaire and Rogers close the file on that topic (where is Graham, or Balanchine?).

Cultural Literacy plays to the large gallery of Americans whose longing (as documented by **Habits of the Heart**) for some national cohesion around a shared culture makes them vulnerable to dubious schemes to bring it about. The arguments fall into place nicely, and the obligatory experimental documentation is convincing, at least until one knows much more about the nature and population of the experiments. When the prescribed curative regimen is examined in detail, however, it is found to be in rags and tatters. It may well be possible, and even necessary, to agree nationally upon some shared intellectual experiences, and Hirsch's list provides a provocative starting point. At least if it makes enough of us mad enough, we may come up with a better one.

QUEST FOR CONNECTION

Eleanor Munro, **On Glory Roads: A Pilgrim's Book About Pilgrimage**. Thames and Hudson, 1987, 297 pp. $17.95. Reviewed by Elaine L. Kleiner, Indiana State University

Eleanor Munro, whose previous books include **An Encyclopedia of Art and Originals: American Women Artists,** has written in **On Glory Roads: A Pilgrim's Book About Pilgrimage** a book which led her into the fields of myth, ritual, sacred art, and the new disciplines of archeo-and ethno-astronomy. However, her work is not so much the fruit of interaction between disciplines as it is a quest for interconnectedness itself. Ms. Munro's "interdisciplinarity" is born in frustration and the desire to understand; it is an elusive and undefinable energy, a process or direction rather than an entity. Her book was created from a conjunction of circumstances--a centered, disciplined scholar of art history, author of respected books in this field, dislocated by the death of her Scottish father into pursuit of knowledge which would lead her to connect systems of interpretation and sensation heretofore thought utterly separate. "I was possessed by the feeling that I had tremendous research to do," she says. "Teilhard de Chardin somewhere remarks that one is not always aware how close a relationship exists between research and a subjective emotional need" (6). Disoriented, dissatisfied by her father's secular humanism as an existential paradigm, she decides to go on a pilgrimage in an effort to discover a more grounded vision of life's worth in the midst of a time when "old myths are painfully and dangerously being reformulated in terms, perhaps, of a life-supporting new one" (xiii).

By undertaking pilgrimages to India, to the Buddha paths in Indonesia, to the journey places of the Hebrews through the Sinai wastes, and finally to St. James's tomb in Spain and St. Bernadette's grotto in France, Munro discovers what she believes is a single fundamental myth which appears to provide a visual setting and internal structure for pilgrimage around the world. Her research begins with a reading of **Hamlet's Mill** by historians of science Giorgio de Santillana and Hertha von Dechend, "with its persuasive if unconventional argument for the astronomical basis of certain myths and images in art" (xiii). Munro owes a great debt to this "essay on myth and the frame of time," itself a profound interdisciplinary study of the Neolithic fountainhead Ur-myth from which both philosophy and science are said to come. She then moves to the relatively new disciplines of archeo- and ethno-astronomy "that seek to support such argument by (the) tangible evidence... (of) monuments and rituals in which the ancients deliberately embodied astronomical ideas" (xiii). Munro puts the propositions of de Santillana and von Dechend together with Levi-Strauss's argument that cultural structures, like art styles, "seep through" their containing membranes to influence neighbors, Stella Kramrisch's thought on Indian myth, and Rudolf Arnheim's on mankind's use of perceived information to survive in an unknown environment. She then proceeds to a general theory about the form, function, and meaning of pilgrimage within the embrace of the Ur-myth.

Her synthesis rests on personal observations connected with documentary facts and arcane ideas. Her book moves gradually through a host of learned sources from a broad range of fields toward articulation of the single powerful imaginative vision that historically shaped the practice of pilgrimage worldwide. She attempts to show that both Asian and Western pilgrimage structures were drawn first from an understanding of the heavens--particularly of the star Sirius, the phenomenon of precession of the pole star through the constellations, the equinoxes, and the solstices--then projected back as compelling images on the natural world.

Munro supports her theory with a vast array of data, most of it in the form of copious notes at the book's end. But women's studies has taught her that the interpretation of data is finally her own, as is her reading of sacred scriptures. She accepts this subjectivity as a necessary dimension of scholarship and, of course, her subjective personal history as a pilgrim forms the book's core. Her basic premise is that the human mind needs "an embracing form within which to orient itself, and without that form, a Pole star or controlling destination by which to plot the life. A thoughtful mind reaffirms its commitment to that destination or guiding principle many times in a lifetime, in metaphors of transformation" (232).

Munro feels that as the millennium comes on, many people sense a new myth surfacing to answer their need for orientation. Its shape comes from the earth-image brought from the moon by astronauts--earth in the arms of time, its icon the double helix. She finds this planetary myth-form still in a state of genesis but capable of generating a mutant genre of art, called "Earthworks" by its practitioners and appreciators.

Its stylistic predecessor is sculpture by Modernist artists like Calder, Kiesler,and Miro: abstract mechanical and biological forms celebrating industrial beings and benevolent nature. That work was imbued with the authority and optimism of an earlier time. The new idiom is vastly more austere and lonely: quasi-architectural forms constructed in remote sites in the American West. Its conceptual predecessor is the anonymous work of ancient and tribal peoples around the world. Like Stonehenge, like the "walkabout trails" Australian aborigines follow across terrorizing wastelands they call "Eternity," like rock-cut tunnels in Egypt and Ireland and Arizona, into which the sun drives on certain days to light carvings on the far walls; like the "hitching post of the sun" atop Machu Picchu; like the Big Horn Medicine Wheel in Wyoming, oriented to certain star-risings; like stone circles and kivas, ziggurats and temples and cathedrals; like--yes even!--the great linga of the Pan Am Building in Manhattan, with helicopters buzzing its tip; like all these, Earth-works perform the immemorial job of orienting and stabilizing a conscious body in space (233).

939

In this myth, the earth, the life-sown planet, counts for something in the sum total of the universe. Its scripture is not the work of a single sage or people but Earth itself. For Munro, to engage in such myth-forming work is to establish orienting axes between the self and the beyond for the sake of the knowledge of future descendants.

Yet, Munro's book ends in sadness. The interdisciplinary vision of connectedness fades and doubt enters in: "Does our sense of things reflect their nature or only the nature of our need? For all we know, organic life is the offspring of a misalliance of protons in the primordial mist, and human hunger for form, a later misalliance of neurons in the brain" (233).

Her hope remains, however, that this new myth, its content a mystery to be pursued, may enable humanity to survive another age: "For like those who go down the river toward the ocean that rises to the stars, those who go down the intricate and unbroken continuities of scholarship, art, or memory will arrive at their destination, which is their destiny" (239).

Munro's closing remarks come to us from a beach on a cold Cape Cod day and she leaves us to contemplate one final image: a single foot print in the sand pointed off and away toward distant light and the northern horizon, edged with shadow.

Does Munro's book succeed given the fact it trails off into what sharp-edged disciplinarians would call the typical interdisciplinary muddle? Author and **New York Times** book reviewer Ronald Blythe believes so: "There could be no more salutary tract for this period of human history when some inept politician has the means to shatter the cosmos than this poetic notion of how mankind has labored with all the imaginative power possible to keep it whole (holy) and intact--valuing it, loving it, and protecting it from all harm" (April 26, 1987, 9).

Munro's book suggests that the best definition of "interdisciplinarity" is one which incorporates its competitors as steps in its own progression toward fullness of meaning. Of course, such a definition does not sound like a definition at all, but rather like a series of steps or stages in the development of a human mind or other living thing. When the quest for interconnectedness ends in formalized relationship, a new "way of knowing," a new discipline has crystallized. For this reason, "interdisciplinarity" must be defined as the quest, the process, the search for interconnectedness itself--the traveling "On Glory Roads."

1989 NAHE CONFERENCE

Proposals for papers, panels, workshops, presentations, and other activities are now being accepted for the 1989 NAHE Conference in Kansas City, Missouri, April 20-22. The theme is "Teaching the Humanities." Send inquiries and proposals to James Mehl, Program Director, Department of Humanities, Missouri Western State College, St. Joseph, MO 64507. **Deadline: September 1, 1989.**

NAHE MEMBERSHIP

Why not share membership information with your colleagues in your college or university, elementary or secondary school, state humanities council, historical society or museum? Many of them are looking for just such an organization as NAHE. Copy the NAHE application form and pass it on to them.

NAHE MEMBERSHIP APPLICATION

Your name ______________________________

Your address ______________________________

INSTITUTES, WORKSHOPS, PAPERS, ETC.

The **South Central Modern Language Association** will include a special session on Interdisciplinary Studies in the Humanities at its October 21-23 convention in Arlington, Texas. Chairperson is Keith Odom, Department of English, Texas Christian University, Fort Worth.

Just two days before that Conference, the Association for Integrative Studies, NAHE, and The College of Liberal Arts of the University of Texas/Arlington will be sponsoring **The Conference on the Interdisciplinary Humanities: Social, Scientific, and Artistic Contexts**. This Arlington, Texas conference will focus on the interdisciplinary nature and uses of the humanities, not only in the traditional humanities but also in terms of their interaction with the realms of science, social science, and the professions. Proposals are welcome from individuals or groups for papers, workshops, panel presentations. Include name, address, phone number, title, and one page summary of paper or session. **Proposal deadline: May 15, 1988**. Submit to Dr. David Jacobs, Associate Dean, College of Liberal Arts, The University of Texas/Arlington, P.O. Box 19617, Arlington, TX 76019; (817) 794-5015.

Americans and the Automobile Conference sponsored by the Society for Commercial Archeology and the Henry Ford Museum will be held November 4-6, 1988 at the Henry Ford Museum in Dearborn, Michigan. Session topics include The Automobile and Society, The Automobile in Media and the Arts, etc. **Deadline for abstracts: June 1, 1988**; Jennings, 485 College of Design, Iowa St. University, Ames, IA 50011; (515) 292-7192 MWF. Conference inquiries: SCA President: Mike Jackson, (217) 785-4512.

The 1989 Popular Culture Association/American Culture Association Meeting will be in St. Louis, Missouri on March 22-27. Calls for papers include the following: **Politics and Literature** - on any aspect of American politics and literature. Send one page proposals by **September 15, 1988** to Adam J. Sorkin, ACA Area Chair, Literature and Politics, Penn State-Delaware County Campus, Media, PA, 19063. **Cemeteries and Gravemarkers** - on any appropriate disciplinary perspective. Send 250-word abstract by **September 1, 1988** to Richard E. Meyer, English Department, Western Oregon State College, Monmouth, Oregon, 97361; (503) 838-1220, Ext. 362. **Theories of American Culture(s)** will have two special sub-topics: "How Do you Defend or Give Evidence for Assertions about 'American Culture' or 'American (Sub)Cultures" and "The Role of 'isms' in the examination of American Culture." One-page proposals are required, as are finished papers for those proposals that are selected, but thirty-minute sessions should be planned for maximum audience participation. Send abstracts by **September 1, 1988** to Robert Evans and Fred Schroeder, Institute for Interdisciplinary Studies, ABAH 405, University of Minnesota, Duluth, 10 University Drive, Duluth, MN 55812.

The Popular Culture Association of the South and the American Culture Association of the South will hold its 1988 meeting in Knoxville, Tennessee on October 6-8. This interdisciplinary conference invites anyone interested in giving a paper, organizing a session, or making a presentation in another form to send title, abstract, and any particulars to PACS Chair **before May 15**. Send to Mike Zalampas, Jefferson Community College, S.W., 1000 Community College Drive, Louisville, Kentucky, 40272.

The Ball State University Committee for the Advancement of Early Studies will hold its nineteenth annual interdisciplinary conference. Papers and proposals are requested by **May 15, 1988** on any phase of Medieval/Renaissance Studies. Contact Bruce W. Hozeski, Department of English, Ball State University, Nunci, IN 47306.

The International Society for Exploring Teaching Alternatives will hold its 18th Annual Conference on October 6-8, 1988. The theme of the conference is "Exploring Teaching Alternatives." Paper sessions and workshops will be presented by educators from the humanities, social sciences, natural sciences, engineering, nursing, education, business, and other professional programs. Paper sessions will focus on assessment and accountability, teaching strategies, thinking skills, motivation (both student and faculty) and other instructional methods that enhance active student participation and learning. For further information write to: Ken Klopfenstein, Department of Mathematics, Colorado State University, Ft. Collins, CO 80523. To submit a paper, send a typed, two-page abstract and a four-line description summarizing the ideas for your presentation. These must be postmarked no later than **April 15, 1988**. Notification of acceptance will be mailed by **June 15, 1988**.

Journals: Vietnam Generation. A new journal devoted to the study of the Vietnam War and its effects on American society, culture, and politics, welcoming submissions for its first four issues from scholars in any field and encouraging an interdisciplinary approach. **Fall 1988** - America in Vietnam: the Process of Historical Revision; **Winter 1989**: A White Man's War: Race Issues and Vietnam; **Spring 1989**: Teaching the War: Interdisciplinary Approach; **Summer 1989**: Personal-Political: Women in Radical Political Groups, 1960 to the Present. Send submissions and correspondence to Kali Tal, **Vietnam Generation**, American Studies Department, Yale University, 320 York St., New Haven, CT 06511; (203) 865-8497.

Theory, Culture, and Society, Special Issue on Postmodernism. Contents include "Is there a Postmodern Sociology," "Postmodernist Aestheticism: A New Moral Philosophy?" "The Post Modern Debate over Urban Form," "Beyond Progress: The Museum and Montage," and "Post-Modern Politics." Published by Department of Administrative and Social Studies, Leeside Polytechnic, UK. Send $15 + $1.50 postage to SAGE Publication, Ltd., P.O. Box 5096, Newberry Park, CA 91359.

Aristotle for the Non-Specialist, a six-week institute introducing Aristotle's works to 25 college faculty members who teach some of his writings but who are not themselves expert in his thought as a whole. The institute runs from July 5 to August 12. For application form send name, address, academic or professional affiliation to Professor Eugene Garver, McNeely Chair in Thinking, St. John's University, Collegeville, Minnesota, 56321. St. John's is about 80 miles northwest of Minneapolis-St. Paul.

The Seventh Annual Meeting of the Group for Research into the Institutionalization and Professionalization of Literary Studies (GRIP) will focus on "Disciplinarity: Formations, Rhetorics, Histories." The meeting will be on April 20-23, 1989. Inquiries are welcome. Papers must be submitted by **October 15, 1988** to David Shumway, Department of English, Carnegie-Mellon University, Pittsburgh, PA 15213 (412/268-2850).

The University of California Humanities Research Institute provides a continuing series of conferences and seminars addressing themes at the forefront of current dialogue in the humanities. Research themes are developed from major areas of humanistic concern: **Area Studies** (western, eastern, third world, dominant and minority cultures), **Historical Studies** (retrieval of texts and contexts in major periods), **Discourse Studies** (the languages of the arts, humanities, and the sciences), **Humanities Beyond Its Boundaries** (humanistic concerns in medicine, law, business, science, etc.) On March 10-11, 1988: Thomas Mann Symposium; on

945

April 8-10, 1988: Annotation and Its Texts (both at UC Irvine). Future conferences now being planned include Biomedical Ethics, Legal History (UCSD), Cultural Interactions: Japan and the U.S., and Women and the French Revolution (UCLA). Nominations and applications will be accepted anytime. As the primary focus of the Institute is on collaborative research, the initial response to proposals usually will be to conduct a conference on the proposed topic on the campus of the proposing faculty or at the Institute. For information write or call University of California, Humanities Research Institute, 307 Administration, Irvine, CA 92717 (714/856-8180).

The Graduate School of the Bank Street College of Education will sponsor its first **Children's Literature Institute, July 18-29**. Graduate courses will be offered on a variety of literary topics from images of childhood in picture books, to the search for self in young adult fiction. Courses on how to write for children will be taught by well known writers and teachers of writers. The theme of this year's Institute is "The Child's Story and the Story's Child." Guest speakers scheduled to address this topic at an all-day conference on Saturday, July 23, from 9-12 and 2-5, include Brian Sutton-Smith (Univ. of Penn.), Maxine Greene (Columbia), Jill May (Purdue), George Shannon (author), Gareth Matthews (Univ. of Mass./Amherst), Virginia Hamilton (author), Dorothy Carter and Leah Levinger (Bank Street). Tickets for the Saturday conference are available to the public for $35.00

Salem State College in cooperation with The Essex Institute will hold its ninth Salem Conference on October 14-15, 1988, focusing on "The Rise of Nationalism and American Culture, 1788-1830." In the three decades after Americans ratified the Constitution and established a new political entity, nationalism emerged as the primary impulse for development of the arts in America. This conscious search for national identity found expression in the first American novel, the first American secular songbooks, the first American dancebook, the first American landscape paintings, patriotic epics, the repeal of the theatre laws, and innovative architecture and furniture making. The Conference Committee welcomes papers on these and other topics that link nationalism to the cultural, literary, and artistic development of the period. The Committee is especially interested in papers that focus on New England. **Deadline for submission: July 1, 1988**. Contact Patricia L. Parker, Department of English, Salem State College, Salem, MA 01970.

New Major in Interdisciplinary Humanities, NAHE member **Michael F. Wagner** has been appointed Coordinator of the new major at the University of San Diego. "Instituted in 1988, the Interdisciplinary Humanities Major is a full major. It is not, for example, just a certification program to supplement a student's "real" major. This major is *interdisciplinary* because it requires that students take courses from several different Humanities disciplines and it places special emphasis on interrelationships among these disciplines. The Humanities disciplines are: Art, English, Foreign Languages, History, Music, Philosophy, and Religious Studies." For a brochure, write to Mike Wagner, c/o Dept. of Philosophy, University of San Diego, San Diego, CA 92110.

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanities, humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three commentaries, etc.; and articles of six to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

ACCESSING OLD VISIONS: AMERICAN MYTHOLOGY AS A UNIFIED APPROACH TO AMERICAN STUDIES

INTRODUCTION

Since its inception the American Studies movement has mirrored the archetypal American pursuit itself. The El Dorado of our discipline--a distinct methodology and unified vision of American civilization--has proved as elusive as that envisioned by those who first explored America's meaning and mystery. Shaped by the discoveries of American Studies pioneers, however, the exploration continues. What follows is another exploration, not a claim for an American Studies utopia but a hope that this curricular model will offer secondary students a way of understanding, in a comprehensive manner, the American culture. Our experience teaching American Studies on the high school level for thirteen years suggests that most students do not study civilization in this way.

This model assumes that for many students the study of the American experience becomes a confusing exercise. The departmental demarcations that characterize secondary education mean that a student may study history in one class, literature in another, government, art, music in still others. Connections among the various courses may be drawn serendipitously, but dynamic interaction is erratic and rare. The result is an obscured big picture for many, an ill-fitting jigsaw puzzle where the pieces never fully take shape to link smoothly and encourage solid understanding. This mode of learning, the norm for most, may explain some of the problems colleges identify in their undergraduates: lack of historical literacy, lack of familiarity with basic literary themes, inadequate sense of chronology. It may also explain why many students fail to see the significance of these disciplines in their lives. One response to this all-too-familiar picture is to offer students a unified approach to the American experience in the conviction that it will help them to perceive the interconnection of historical events, literature, material culture, the arts--and ultimately of their own place in the scheme of things.

This model asserts that because certain myths have been central to both the vision and the reality of America, interpreting the American experience in light of these myths can provide a useful tool for understanding our past, knowing ourselves, and shaping our future. While the mythic approach is certainly not new to American Studies, it has never reached the level of secondary textbook publishing and probably never will. Since the reality of secondary education in virtually all disciplines is reliance upon a standard text, American mythology becomes an overlay to the con-

951

ventional chronological approach. Myth, therefore, becomes the interpretive principle for understanding the chronology. This myth model enables students to discover continuity in the American historical experience and to see interrelationships of American cultural themes. A study of both myth and reality then, becomes essential in American culture studies.

I. MYTH AS INTERPRETER OF CULTURAL EXPERIENCE

Clearly, the popular view of the terms "myth" and "reality" as antonyms is erroneous in this instance. James Oliver Robertson says in **American Myth, American Reality** that to contrast myth and reality is a mistake, the "one...unreal, false, a lie; the other...objective, understandable, the truth." Because students commonly identify the term myth with something patently untrue, they need to be grounded in a different set of definitions for this model. First, each must commit to memory an accurate working definition, since the concept of myth is central to the entire organization. The dictionary definition is a good starting point:

> *Any actual or fictional story, recurring theme, or character type that appeals to the consciousness of a people by embodying its cultural ideals or by giving expression to deep, commonly felt emotions.*

The teacher can reinforce this formal definition with Brian Dippie's explanatory observation that "myth is 'a notion based more on tradition or convenience than on fact; a received idea'--and for good measure, this: 'a myth is truer than truth'."

Students must also understand the concept of myth as metaphor. This comprehension occurs rather more slowly and is achieved by studying examples from literature and history. For the teacher's background reading, Richard Slotkin and Joseph Campbell are useful. Slotkin's **The Fatal Environment: The Myth of the Frontier in the Age of Industrialization, 1800-1890,** provides excellent material on the function of myths as theoretical constructs for examining a culture and deserves to be quoted at length:

> *Myths are stories, drawn from history, that have acquired through usage over many generations a symbolizing function that is central to the cultural functioning of the society that produces them. Historical experience is preserved in the form of narrative; and through periodic retellings those narratives become traditionalized. These formal qualities and structures are increasingly conventionalized and abstracted, until they are reduced to a set of powerfully evocative and resonant "icons"--like the landing of the Pilgrims, the rally of the Minutemen at Lexington, the Alamo, the Last Stand, Pearl Harbor--in which history becomes a cliche. At the same time that their form is being simplified and abstracted, the range of reference of these stories is being expanded. Each new context in which the story is told adds meaning to it, because the telling implies a metaphoric connection between the storied past and the present....*
>
> *In the end myths become part of the language, as a deeply encoded set of metaphors that may contain all of the "lessons" we have learned from our history, and all of th essential elements of our world view. Myth exists for us as a set of keywords which refer us to our traditions, and (as Martin-Green says) transmit "coded message(s) from the culture as a whole to its individual members."*

Slotkin shows here that myths are a deeply embedded part of the way Americans communicate with each other. For teachers and students raised in the American culture, myths are integral to the language for we've reduced them to keywords--keywords to ideas, to lessons the culture accepts as true. These are lessons learned from our past, lessons of history. We refer to them as **outward** lessons because they represent understanding formed from events.

Another kind of understanding comes from studying the motivations and psychological experiences of individuals in narratives particular to the American culture. This study teaches us **inward** lessons, for it reveals that the psychological experiences of many other people are actually our own psychological or inward experiences. Looked at with the intent to interpret these inward lessons, these myths provide maps for self knowledge, a significant interest of high school student.

Joseph Campbell, whose 1949 work **Hero with a Thousand Faces** has provided the starting point for many mythic approaches, provides useful background for the teacher. He emphasizes myth as metaphor and concentrates on the inward journey as the outcome of the study of myth and myth narratives. Grounded in Carl G. Jung's theory of archetype, Campbell argues that "the connotations of the metaphors of myth are always to spiritual realizations potential within the human heart, which are to be brought into play in human life." In other words, myths are telling our own inner stories; when understood, they reveal our own spiritual potentiality. He cautions against studying myth with only outer, historical application in mind. To ignore myth as personal revelation is comparable, he argues, to ordering a desired dinner in a restaurant and then eating the menu description instead of the prepared meal.

The combination of this outward and inward thrust of myth serves to engage students and teachers in a common quest for understanding through objective and subjective means. Moreover, this approach gives students and teachers a common lexicon for discussion of their perceptions. The elements of the model that follows become the keywords in a shared vocabulary as both pursue a study of the meaning of the American experience.

A graphic overview of this model requires envisioning a complex but unified architectural structure--perhaps a modern enclosed shopping mall--established firmly on solid ground. The ground represents the underlying **myth of origin**, common to many cultures. The superstructure we'll call the **foundational myth**, a distillation of the core American experience. The varied shops composing the superstructure and simultaneously emanating from it symbolize seven myths--or **sustaining myths**--that are implied by and elemental to the foundational myth. The total structure is established yet dynamic and is characterized by a predictable decay/rebirth cycle and by a paradoxical dual thrust toward the ideal and the pragmatic.

II. MYTH OF ORIGIN

Embedded in America's vision is the myth of origin. Like all cultures America has both concrete beginning and mythical ones: it can be said both that it was born at a particular time in a particular place and it was conceived, as Eric Hoffer puts it, in "the eternal, haunting, craving of men to be born again, the yearning for a second chance." In contrast to the Old World--corrupt, tyrannical, closed, and in decline--stands the new. And the new vision centers on moral innocence. R.W.B. Lewis argues that America's self-image of moral innocence was embodied in the image of a radically new personality:

> *The hero of the new adventure: an individual emancipated from history, happily bereft of ancestry, untouched and undefiled by the usual inheritances of family and race; an individual standing alone, self-reliant and self-propelling, ready to confront whatever awaited him with the aid of his own unique and inherent resources. It was not surprising, in a Bible-reading generation, that the new hero (in praise or disapproval) was most easily identified with Adam before the Fall. Adam was the first, the archetypal man. His moral position was prior to experience, and in his very newness he was fundamentally innocent. The world and history lay all before him. And he was the type of creator, the poet par excellence, creating language itself by naming the elements of the scene about him. All this and more were contained in the image of the American as Adam.*

This creation myth, then is the solid ground on which to build the mythic structure for a unified approach to American culture. Its enduring and formative influence on cultural development is evident in the repeated attempts to recreate the Garden, the earthly paradise. It provides the fertile soil and the secure base for the second element of the model, the superstructure we term the foundational myth.

III. THE FOUNDATIONAL MYTH

The foundational myth could also be called the primal American myth, the distillation of the American experience. Modified from Benne and Hefner, that myth is as follows: **the core American experience is the exhortation to break away from a limiting past in a struggling ascent towards the realization of unlimited possibilities in an open and expansive future.** Benne and Hefner's phrasing of the concept is "...to shake free from a limiting past in a struggling ascent toward the realization of promise in an open and gracious future." The elements remain the same. Such a myth suggests the three acts in the classic American drama: (1) the attempt to leave behind a past which is limiting, confining, restrictive; (2) the struggle to overcome the challenges of the present, a struggle which puts a premium on individual resourcefulness; and (3) the striving to arrive at a destination which promises everything. This foundational myth becomes the core experience through which students are asked to under-stand historical events, literary texts, material culture, works of art, and other cultural expressions.

It, like the definition of myths, must be committed to memory by students, who then internalize the three elements and learn to identify individually the myth's reenactments. Significantly, this myth--large, complex, and encompassing--has room for the paradoxes of American history and for what Kammen calls the contrapuntal themes of American civilization.

IV. SUSTAINING MYTHS

The three part foundational myth is worked out more concretely in seven "sustaining myths", explicit reenactments or recurring embodiments of the cultural ideals implied by the foundational myth. Students are encouraged to identify these themes, not only as they are found in historical reality, but also as they are translated into myth-narratives. Myth-narratives are defined here are "morality tales which represent conscious or unconscious parables of American life." This, then, becomes the framework for looking at literary texts, the arts, and popular culture--the primary conveyors of myths. The seven sustaining myths are as follows: **the myth of America's redemptive mission, the myth of rural simplicity,**

the myth of the democratic ideal, the myth of success, and the myth of endless abundance.

A. THE MYTH OF AMERICA'S REDEMPTIVE MISSION: While the redemptive mission of America is a long-recognized theme in intellectual history, we are attracted to Robert Jewett's notion of the American hero's role in what he calls the "American monomyth." In his introduction to **The American Monomyth,** Jewett describes that myth/hero:

> *A community in a harmonious paradise is threatened by evil: normal institutions fail to contend with this threat: a selfless superhero emerges to renounce temptations and carry out the redemptive task: aided by fate, his decisive victory restores the community to its paradisal condition: the superhero then recedes into obscurity.*

American foreign policy, in particular, can be introduced in this context of a world view which sees the United States as redeemer hero, as superhero: a Lone Ranger, morally innocent in a hostile world; carrying out redemptive missions over the globe; the American Adam throttling the serpent. So this myth and its application to the American concept of heroism provides students a place in which to ground any number of episodes--from John Winthrop's call for the creation of a City Upon a Hill in Puritan Massachusetts, to Shane's rescue of the American West from the forces of savagery, to Oliver North's zealous pursuit of Cold War objectives. The redeemer hero, a descendent of the American Adam, plays a key role in the unfolding of the foundational myth and provides an important self-image for Americans. As the model will suggest later, this myth--like all of the sustaining myths--has darker implications as well as visionary possibilities. For example, the redeemer hero for some is the embodiment of socially responsible individualism; for others, he can be twisted by the zeal that often accompanies the pursuit of a righteous cause.

B. THE MYTH OF RUGGED INDIVIDUALISM: The myth of rugged individualism is most apparent in the "struggling ascent" Americans must engage in so that they realize their individual and collective futures. Frederick Jackson Turner's characterization of this mythical quality, still a good articulation of deeply-held beliefs, emphasizes key qualities:

> *...coarseness of strength combined with acuteness and inquisitiveness; that practical, inventive turn of mind, quick to find expedients; that masterful grip of material things, lacking in the artistic but powerful to effect great ends; that restless, nervous energy; that dominant individualism, working for good and evil, and withal that buoyance and exuberance that comes with freedom.*

The value Americans have traditionally placed on rugged individualism is manifested in diverse characters: Andrew Jackson and his rise to power; Henry David Thoreau and his condemnation of conformity; Jane Addams and her tireless effort on behalf of newly-arrived immigrants; Horatio Alger, Jr. and his boy-heroes; the list goes on. The myth of rugged individualism sustains the belief that in America anything is possible, any promise can be fulfilled for the person willing to struggle mightily.

C. THE MYTH OF THE MELTING POT: The expansive nature of America's primary (or foundational) myth is illustrated by the myth of the melting pot. It suggests that the beacon of American opportunity is seen by millions all over the world and is reachable because America's icon to this myth, the Statue of Liberty, have proven the power of the myth to shape both historical reality and cultural perception:

> *Give me your tired, your poor,*
> *Your huddled masses yearning to breathe free,*
> *The wretched refuse of your teeming shore*
> *Send these the homeless, tempest-tost to me.*
> *I lift my lamp beside the Golden Door.*

But, as with the other sustaining myths, the denial of that opportunity provides another powerful undercurrent in American Cultural history.

D. THE MYTH OF RURAL SIMPLICITY: The environment in which the foundational myth is acted out (or the environment to which many have sought to return) is the Edenic paradise, the Garden, the image of rural simplicity. The myth of rural simplicity is a recurring subtext for a variety of visions: Thomas Jefferson's hopes for an agrarian America, Brook Farm, Norman Rockwell's small town, Disneyland. Robert Jewett describes the mythic Eden this way:

> *It is neither the pure state of nature, the pastoral world of small farms and plantations, nor the urban metropolis. It is a small, well-organized community surrounded by a pastoral realm whose distinguishing trait is the absence of lethal internal conflict arising from its members. The citizens are law-abiding and cooperative, without those extremes of economic, political, or sexual desires that might provoke confrontations. A cheerful atmosphere pervades the homogeneous populace, and there is no hint of a tendency on the part of the majority toward evil. If there are evil individuals in the community, they are clearly differentiated by behavior, dress, and physical appearance.*

This mythical earthly paradise is a powerful image in America and sustains belief in the foundational myth, a myth which suggests that the Edenic paradise can be reached or perhaps regained.

E. THE MYTH OF THE DEMOCRATIC IDEAL: Relationships between inhabitants of this Edenic community are governed by the commonly-held belief in the democratic ideal. Relationships between individuals and relationships between individuals and institutions are governed by an abiding respect for individual integrity and an unflinching commitment to equality of treatment. The Declaration of Independence, a sacred text in America's civil religion, contains the clearest invocation of this ideal:

> *All men are created equal and they are endowed by their Creator with certain unalienable rights; among these are life, liberty, and the pursuit of happiness.*

Stated as such, this myth of the democratic ideal sustains the conviction that in the struggling ascent to a better future, individually and collectively, preferential treatment will not be accorded.

F. THE MYTH OF SUCCESS: Another belief contributing to the sustenance of the foundational myth has been the myth of success. The attainment of goals--the stereotyped American success story--testifies to the enduring faith in the "struggling ascent." American cultural mythology and objective reality are full of self-made men and women, though perhaps not as many or in as pure a form as our mythology suggests. The myth of success, besides confirming our belief in the essential fairness of the struggle, provides a road map to future achievement. The individual is entitled to the rewards of the achievement for having tested the American myth and won.

G. THE MYTH OF ENDLESS ABUNDANCE: Americans' belief in an "open and expansive future" is sustained by the vision of endless abundance, a "cornucopia for all the world," to use Louis B. Wright's phrase. Rooted in a frontier culture, nurtured by what is often called "Europe's oldest dream," America's formative years left a legacy of unlimited expectations. The material bounty of America has given rise to both the sublime and the ridiculous; it has invigorated America with a drive toward spiritual perfection. Emerson pronounces in "The Young American,"

> *...The bountiful continent is ours...and new duties, new motives avail and cheer us...It seems so easy for America to inspire and express the most expansive spirit...*

And it has allowed America to pursue the expedient, symbolized perhaps by that icon of a garbage can culture--the disposable diaper. Whether considering the short-sighted practices of early tobacco growers or the psychological effects of Turner's safety valve, this myth provides an organizing context for students.

Obviously, not all sustaining myths are equally applicable for all periods of American cultural history. They do provide, however, an organizing schema for almost all cultural expressions important in a broad survey of American cultural history. They also help students to see the complexities of the foundational myth and enable students to apply that interpretive principle with greater understanding.

V. THE DECAY/REBIRTH CYCLE OF THE FOUNDATIONAL MYTH

The concept of historical cycles gives students another angle of vision for seeing the foundational myth unfold in American experience. Similar to Harvey Wassermann's description of six cycles of American history, each shorter in duration, this model identifies the periodic drifting away from the primary myth and subsequent "great awakenings," or more properly, "great reawakenings." This cyclical decay and rebirth of America's foundational myth becomes a central pattern to which students are directed. It provides a context into which students can place a variety of topics: the redirection of American energies suggested by Ralph Waldo Emerson, the decadence of the Newport plutocracy in the Gilded Age, or the spirit of renewal embodied in Joni Mitchell's **Woodstock**, to name a few. As with all elements of this model, it provides students with a touchstone, a schema with which to understand the complexities of the American experience.

VI. PARADOX IN THE FOUNDATIONAL MYTH AND THE SUSTAINING MYTHS

The cyclical reawakenings of the foundational myth suggest the next major element of this model: The foundational myth and the sustaining myths have been constantly marked by paradox as, in reality, America pursues both the ideal and the expedient. The myths, as this approach uses them, do not suggest a consensus view of the American experience, though it recognizes that, as Richard Slotkin observes, "the traditional character [of myths] makes [them] most useful to conservative ideologies". At the same time, myths can be, and have been, "invoked as part of a radically critical ideology." Indeed, the model does not hold that America can best be understood by the looking at the ideals themselves or at their periodic failure; rather, it holds that the very language of the foundational myth allows both the ideal and the actual to exist simultaneously. One of the best descriptions of this paradox is cited by Michael Kammen in **People of Paradox** as he quotes historian Carl Becker:

> *Whether it has been a matter of clearing the forests, or exterminating the redskins, organizing a government or exploiting it for private advantage, building railroads for the public good or rigging the market in order to milk them for private profit, establishing free schools by law or placing illegal restraints on the freedom of teaching, conferring on Negroes their God-given constitutional rights or making sure they do not vote, applauding the value of temperance or perceiving the convenience of bootlegging--whatever device for dealing with it, is apt to seem to us good enough so long as it gets the business done. Throughout our history ruthlessness and humane dealing, respect for law and right and disregard of them, have run side by side: in almost equal degree we have exhibited the temper of conformity and of revolt, the disposition to submit voluntarily to law and custom when they serve our purpose and ignore them when they cease to do so.*

Becker makes clear that which America's dark Romantics, Hawthorne and Melville, knew: American culture, no less than human nature, contains both innocence and evil.

This myth model stresses, then, the contrapuntal themes (both Kammen and Benne/Hefner use this term) in the American experience; it encourages students to see the roots of the paradox in the foundational myth itself and the conflict between individual and collective good. Students identify the "vast amounts of wreckage" Americans have left behind as they have tried to break away from the past. Can we ever move innocently "from one frontier to the next without leaving many wounded behind...? (H)ow do we maintain the dynamic acceleration and exhilaration of the American dream and yet take responsibility for the past left behind?" The model does not suggest answers to these questions but does pose them for students as they wrestle with the ambiguity, complexity, and paradox.

In the same fashion, the foundational myth has assumed that the struggling ascent is fundamentally innocent. If the arena for one's battle to achieve a particular future is, indeed, open to all on an equal basis, then the competitiveness that the myth requires would perhaps be pure. But, we recognize that that has never been the case, and know also that the premium placed on individual ascent has at times sacrificed the collective ascent. So, the second phase of the foundational myth has a dark side, as does the first. As noted by Benne and Hefner:

> *Its activism and voluntarism has little patience for or comprehension of immobilized people or for more passive modes of life. It maximizes liberty, initiative, and creativity but has defective ways of dealing with basic security and creating a corporate morale which can compensate for individual failure or rejections of ascent.*

The central conflict between individual good and collective good provides an organizing framework for a variety of issues and works from **The Grapes of Wrath**, to the Populist demands for public ownership of railroads and utilities, to the Reagan revolution.

Finally, with Benne and Hefner again, this model notes that the primary American myth assumes limitless social and geographic space. The future towards which Americans have struggled is not full of unlimited possibilities, if indeed it ever was. As we move towards the 21st century, students need to be particularly attuned to the consequences of building a culture on the belief that the American future is exempt from economic, geographic, ecologic, and social limitations. So all three major elements of the foundational myth contain the seeds of unforeseen consequences and unacknowledged limitations.

VII. A CRITICAL UNDERSTANDING OF MYTHOLOGY

As students approach the end of their study of the American experience and ponder future possibilities, the model urges them to consider whether or not the long standing sustaining myths continue to be viable, at least in the forms and interpretations widely accepted in our culture. If, as Richard Slotkin suggests, America's mythological metaphors "define a situation for us, prescribe our response to that situation...[and] tell us how we ought to value that situation," we need to challenge our students to look critically at our often misguided "symbolic reenactment(s) of the past."

At this point, the reader may ask: Is not the foundational myth misguided in its suggestion that this core experience encompasses the whole of American civilization? Has the foundational myth been embraced by minority cultures or does it merely reflect the ideology of the dominant culture? These are valid questions and would be valuable to pose to students as they reflect on their study of the American experience. It is our contention, however, that the mythic language of the foundational myth finds expression in the history of most minority cultures' demands for participation in American life.

One clear exception to this is the culture and mythology of Native American Indians. Perhaps the Indian conflict in America can be approached from the vantage point of a clash between incompatible mythical visions. This idea deserves further exploration. The other possible exception to our contention would be the black experience. One could argue that a minority culture such as the black community has been allowed participation only to the extent that it has accepted the terms and mythology of the dominant culture. We believe, however, that the civil rights struggle has reflected both the demand that American society reach for the mythical democratic ideal but we also recognize that American society has denied that opportunity. With these provisos in mind, then, we ask students to examine critically the continued viability of long standing American myths.

This critical examination of American myth is suggested by James Reich in **Tales of a New America**. He argues that our basic fables or morality tales need to evolve:

> *When we become so enchanted with our gables that we wall them off from the pressures of adaptation, the stories may begin to mask reality rather than illumine it. Instead of cultural tools for coming to terms with challenges we face, they become means of forestalling them.*

Having grappled with the paradoxes in the American experience and recognizing the dark and visionary sides of America's foundational myth, students should be encouraged to explore modifications of our sustaining myths--new morality tales which could form the basis of mutually supportive relationships in an increasingly interdependent world.

VIII. SUMMARY OF THE MYTH MODEL AS A UNIFIED APPROACH TO AMERICAN CULTURAL STUDIES

The universality of myths as interpreters of cultural experience needs to be applied to the history of the American people. Articulating a foundational myth (or core American experience) along with **sustaining myths** (or themes which suggest how that core experience is played out in historical time and space) and **myth narratives** (or morality tales which represent conscious and/or unconscious parables of American life) provides students with a comprehensive schema. This framework can accommodate the visionary idealism often associated with America's "uncritical lovers" who continue to proclaim national innocence in the face of unpleasant realities; but it can also accommodate the bitter cynicism of America's "unloving critics" who too often seem to wallow in the mire, blind to real ascent. The myths and realities have produced a genuinely paradoxical civilization but the generations cyclically reenact the foundational myth and reaffirm the beliefs that sustain it. Perhaps it is time to look at a new basis for the American self-image in the context of a changed and changing world, a world which may necessitate the articulation of new versions of old visions.

Using Children's Literature to Popularize Social Studies: A Dialogue with Peter Parley

As teachers search for ways to popularize social studies, it is appropriate to examine the person who produced some of the most popular social studies books published during the nineteenth and early twentieth centuries. Peter Parley, a pen name for Samuel Griswold Goodrich, was among the first American writers of social studies materials that explicitly addressed American children. The popularity of his books is evidenced by the fact that his works sold over twelve million copies and many of his works were pirated by publishers in the United States and abroad.

Samuel Goodrich was born in Ridgefield, Connecticut in 1793. He became a well-known publisher in Hartford and Boston, and as an author he made the pen name Peter Parley famous. Before his death in 1860, he had written tales of Africa, Asia, America, and Europe, and numerous other books that were planned especially for instruction. His goal was to provide interesting, yet informative reading to children.

Part of the general appeal of the Peter Parley books was the extensive use of illustrations, an idea that was not new. Vincent de Paul (1580-1660), a Frenchman who was a Roman Catholic clergyman, may have been the first to suggest the use of illustrations for teaching children. He called sisters, Daughters of Charity, from their cloisters to venture into nearby villages and to teach catechism lessons to young children by the use of pictures and figures.

The thinking and work of early educators, particularly John Amos Comenius (1592-1670) and Jean-Jacques Rousseau (1712-1778), appeared to have influenced Goodrich's approach in writing for young children. By using material based on a child's own experiences, Comenius' writing appealed to a child's sensory perceptions. An illustration of his ideas was Orbus Sensualium Pictus (1658), a book designed to teach Latin to young children using pictures of familiar objects. Goodrich, in turn, extensively used illustrations in most of his works.

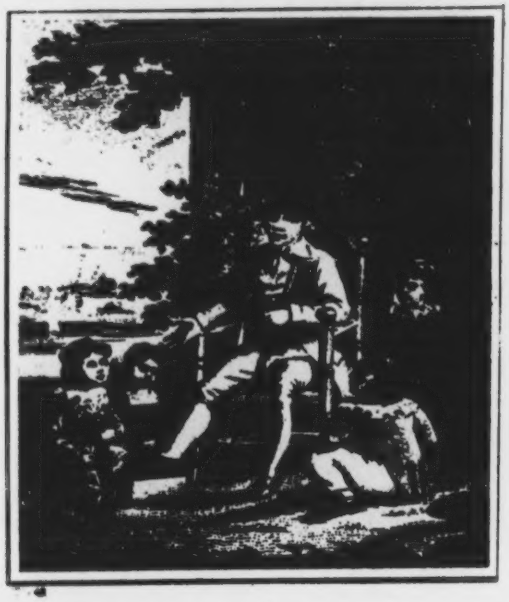
As the eighteenth century drew to a close, the impact of Rousseau, and early childhood education theorist, was felt in the field of children's literature, and this may also have influenced Goodrich's writing. Following Rousseau's theory of allowing the child to develop naturally as he searched for knowledge, Goodrich seized upon every opportunity to encourage comments by a child or to call attention to objects of interest so that incidents might be used as a means of instruction. With Rousseau's theory in mind, Goodrich frequently utilized dialogues along with illustrations to help his readers focus on particular content material.

Perhaps if we examine some of the nineteenth-century literary works of Samuel Goodrich, we can gain some insight into the popularizing of social studies in this and the next centuries. Given the opportunity to talk with Goodrich's alter ego, Peter Parley, the conversation with a contemporary educator might proceed in the following manner.

A Dialogue with Peter Parley

Educator:

Peter Parley was pictured in his works as an elderly man with white hair, wearing a dark buttoned coat, tight knee breeches, and wide-brimmed hat supporting himself with a cane. Sometimes he was pictured sitting, surrounded by children, as if he were telling a story. Why did these pictures of an elderly man appear in many of your works?



PETER PARLEY TELLING STORIES.

from Goodrich, S.G. (1832). *Les contes de Pierre Parley sur l'Amerique*. Boston: Carter and Hendee. Translation into familiar French by F. M. J. Surrault.

Peter Parley:

I gave a picture of myself as I wanted my childhood readers to see me. I wanted to become a welcomed friend and a trusted teacher. My general appearance was that of Master Stebbins who was my teacher from the ages of 10 to 12, and it stimulated children to recall one of the greatest patriotic figures of all time (Benjamin Franklin). I wanted to symbolize American patriotism and be recognized as a storyteller that children looked forward to hearing.

Educator:

Was the use of this image successful?

Peter Parley:

Based on the response my books received, I would have to say yes. Between the years 1828 and 1912, the years my books were in print, twelve million copies were sold. In addition, fortune seekers, realizing the popularity of my books, attached the Parley name to books by other writers or simply reproduced my works at home and abroad using the Parley name.

Educator:

How do you account for your popularity over such a long period of time?

Peter Parley:

Salesmanship! I tried to take my readers on an imaginative trip describing people and places along the way. My books reflected an understanding of children's tastes and their need for participation in the stories. I tried to convert boring subjects into lively discussions. Incidentally, I promoted the sale of future books by suggesting to my readers that they could count on and look for future titles; then I delivered the promised product.

Educator:

Peter Parley's Tales of America was your first book and seemed to set the style for future works. Can you tell me a little about this work?

Peter Parley:

That work was created to give children their first ideas about geography and American history through the eyes of an American. I projected a dual role in the work, as narrator of historical events and as a participant in many of the incidents. A topic was addressed, a question addressing that topic followed, and finally a device such as poetry was used to restate the high points of the passage or book.

Educator:

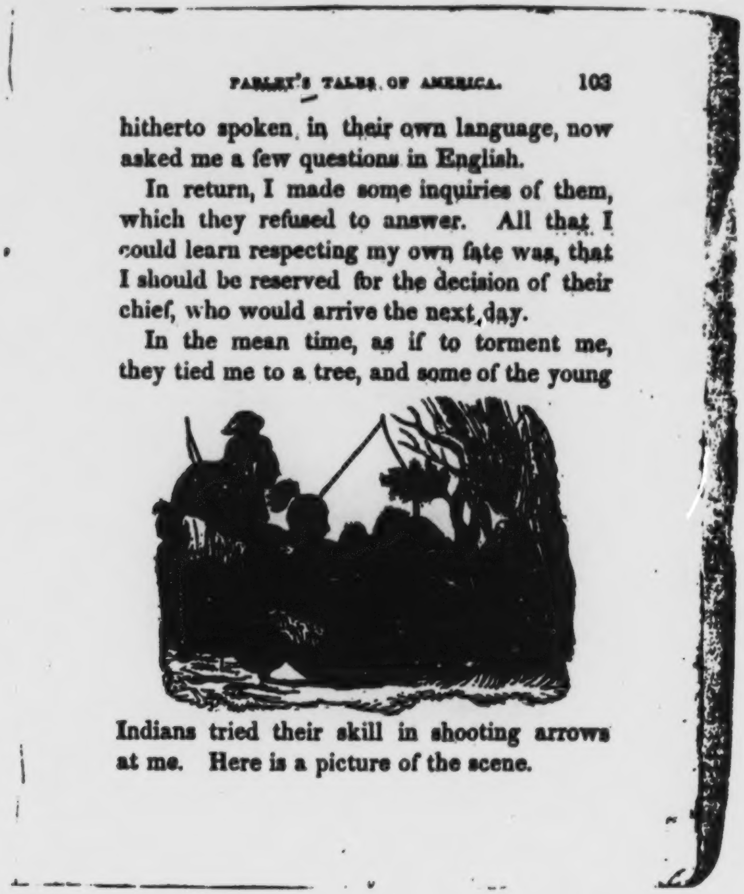
Mr. Parley, why did you use the idea of a dual role in many of your books?

Peter Parley:

I wanted my readers to develop a connection with people, events, and places. My dialogue with young readers fostered that attachment. Until the introduction of my books, American children were presented with histories and geographies written mostly in England. They were dry and factual from an Englishman's point of view and there was little use of anecdotal material. I wanted my audience to experience with me the travels and adventures I reported. Through dialogues, the reader and I developed an intimate attachment as we moved through the book together. My dialogue talked to children rather than at them. I addressed my young readers with down-to-earth and direct language from an American point of view.

Educator:

It was common, Mr. Parley, throughout your works to describe something, then say,



PARLEY'S TALES OF AMERICA. 103

hitherto spoken in their own language, now asked me a few questions in English.

In return, I made some inquiries of them, which they refused to answer. All that I could learn respecting my own fate was, that I should be reserved for the decision of their chief, who would arrive the next day.

In the mean time, as if to torment me, they tied me to a tree, and some of the young Indians tried their skill in shooting arrows at me. Here is a picture of the scene.

from Goodrich, S. G. (1860). *Peter Parley's Tales of America.* Philadelphia: Charles Desilver.

"Here is a picture." What were you trying to accomplish by using this style?

Peter Parley:

I believe that in teaching facts, like history and geography, a teacher should be aware of a child's senses. I selected, as topics in my books, things capable of being perceived through the senses, and pictures provided a good representation of those topics. As I said in one of my poems:

> *"Children are simple, loving, true--*
> *'Tis God that made them so;*
> *And would you teach them?--Be so, too,*
> *And stoop to what they know.*
> *Begin with simple lessons, things*
> *On which they love to look;*
> *Flowers, pebbles, insects, birds on wings--*
> *These are God's spelling book!"*

Educator:

You wrote about America, Europe, Africa, Asia and many more places. These were some of the earliest social studies textbooks in America.

Peter Parley:

I believe that's a fair observation. My tales of travel throughout the world resemble "travelogues." I am convinced that fact can be as interesting as fiction. I wanted to provide children with a better understanding of geography, history, government, and cultural concepts. Using a story line, anecdotes, and dialogues to accomplish this purpose worked very effectively.

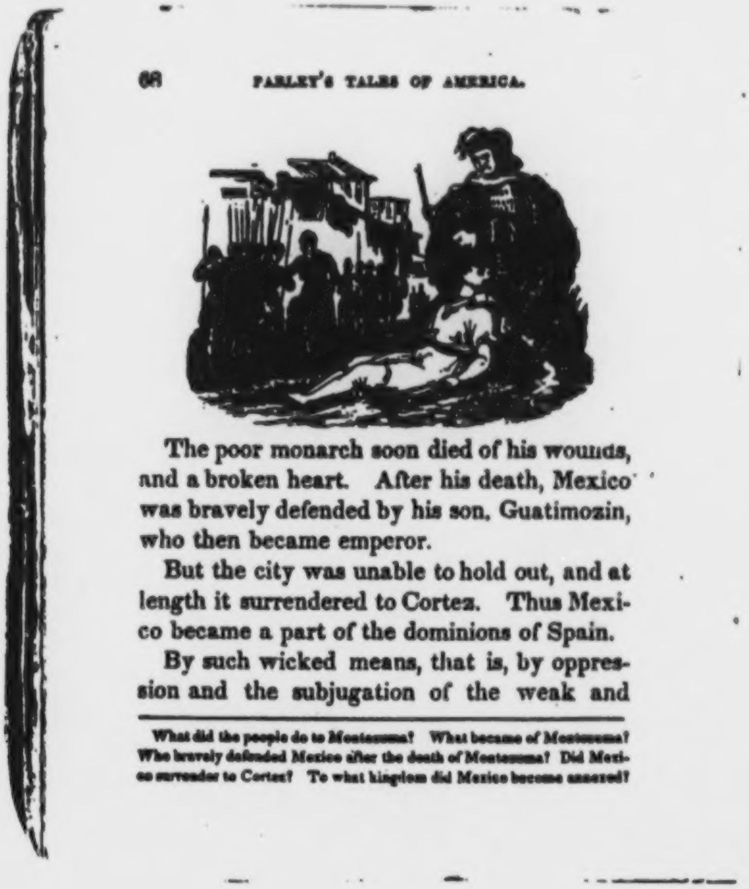
Educator:

It seemed to be a common practice of yours to place questions at the bottom of the page in your books. What was your purpose in doing this?

Peter Parley:

Those questions helped train my young reader's memories. I tried to write in a clear, concise style in order to accommodate a variety of reading levels and help children better understand social studies concepts at the same time.

I like to imagine myself on the floor surrounded by a group of boys and girls, and I wrote to them as I would have spoken to them. I love to tell a story and immediately ask the children questions. When a child



68 PARLEY'S TALES OF AMERICA.

The poor monarch soon died of his wounds, and a broken heart. After his death, Mexico was bravely defended by his son, Guatimozin, who then became emperor.

But the city was unable to hold out, and at length it surrendered to Cortez. Thus Mexico became a part of the dominions of Spain.

By such wicked means, that is, by oppression and the subjugation of the weak and

---

What did the people do to Montezuma? What became of Montezuma? Who bravely defended Mexico after the death of Montezuma? Did Mexico surrender to Cortez? To what kingdom did Mexico become annexed?

from Goodrich, S. G. (1860). *Peter Parley's Tales of America.* Philadelphia: Charles Desilver.

restates an event in his own words, he or she internalizes it.

Educator:

If you could make one suggestion to social studies teachers today about how to improve their instruction and promote social studies, what would it be?

Peter Parley:

Teachers should utilize a child's natural curiosity to develop lessons which use creative narration guiding students from simple to more complex ideas. Make the lesson an adventure and the children participants in exploring, observing, and promoting the free flow of ideas. Make the lesson an adventure and the children participants in exploring, observing, and promoting the free flow of ideas. Focus upon a few important facts and concepts. Use children's historical fiction and other literature to help students develop the feeling of and a connection with people, events, and places.

Educator:

Thank you, Mr. Parley, for your candidness. From our conversation, I'm convinced that you converted boring textbooks into lively narratives which were very popular with young readers. You had a natural writing style that spoke to children in everyday language. Your works were some of the earliest social studies textbooks, and they contrast drastically with today's works. Perhaps dialogue was the key to your popularity. Is it possible that current textbooks focus upon so many facts and concepts that the result is little internalization of material? From our conversation you indicated that one of the keys to popularizing social studies might be to incorporate children's literature into social studies instruction. Since literature is a vital part of our cultural heritage, it may be natural to incorporate it into the social studies curriculum. Literature combined with social studies may come closer to addressing social and cultural needs than any other component of the curriculum. Through social studies, supplemented with literature, we can learn about ourselves, other people, other times and places, and enjoy it at the same time. The integration of social studies and literature could be another way to stimulate more interest in the total social studies curriculum.

CONSTRUCTS OF HUMAN EXPERIENCE: A COURSE IN INTERDISCIPLINARY HUMANITIES

Interest in interdisciplinary approaches to education has been strong in many university and college academic communities for some years now, and efforts of many kinds have been made to formulate a coherent philosophy and program of interdisciplinary education for colleges. The result is, commonly, to bring several disciplinary viewpoints to bear on a common issue--which may well prove beneficial to the participants--but they remain in the end just a grouping of perspectives. Typically, rather little is done in a systematic and rigorous way to examine the likenesses and differences between two or more of the disciplines that deal in distinctive ways with material common to all of them. In other words, the result is usually multidisciplinary but not interdisciplinary in a strict sense.

A great deal can be gained, it seems, by directing one's attention not only to subjects and issues addressed by several disciplines but also, and especially, to the ways in which these several disciplines function, individually and in comparison with each other. For one thing, this approach effects a crossover from a merely multidisciplinary to an interdisciplinary effort.

In the hope that a description of a "working model" of an interdisciplinary course--even if not an ideal one in every way--might be useful, I propose to describe one of the courses taught for some years now by the Humanities Department at Wayne State University.

The course in question is a three credit course entitled "Constructs of Human Experience: Histories, Novels, Philosophies." The common denominator among these disciplines, apart from their being expressions of human nature, is that they all generally appear in the form of rather long prose works. Despite this commonality, however, they exhibit substantial differences in the special logic distinctive of each kind of writing as well as vast and extremely important variety within each kind of expression. This is essentially a course on how to read histories, novels, and philosophies critically, and this in a double sense: within the confines of each discipline represented as well as across the range of them.

In order to avoid an excessive emphasis on abstract theory, the course if focussed on insightful and interesting works from the literature of history, fiction, and philosophy. Working with a pair of examples in each category--I personally have used Thucydides' **History of the Peloponnesian War** and Karl Marx's **The Civil War in France**; Faulkner's **As I Lay Dying** and Dostoevski's **Crime and Punishment**; Descartes' **Discourse on Method** and Plato's **Republic**--the course examines the six books, taken separately and in comparison with each other, as examples of important historical, fictional, and philosophical writing.

It is made clear at the outset that histories, novels, and philosophies are indeed **constructs** of human experience, that is, they are "facts" in the literal sense of the Latin **facta** or "things made." Facts do not lie around readymade on the intellectual landscape, available for all-purpose use; they are made in the course of varying lines of inquiry. Vary the inquiry and you vary the relevant facts; there are as many kinds of facts as there are lines of inquiry. As Goethe put it: "The most important thing to grasp is that everything factual is already a theory." Since even the longest imaginable book in history, fiction, or philosophy will inevitably fail to present "all possible facts" on its topic, it is important to examine the kind of book an author has written and the kinds of facts that get into that author's book and why. And this principle of variety of facts based on difference of inquiry leads not only to a variety of disciplines--history, fiction, philosophy--but to many substantial differences within each of them.

HISTORY (which means "inquiry," etymologically) is governed by its central focus on actual events of the past and their meaning. It summons human memory and records to its aid in attempting to reconstruct the past. Its facts and its plot are the pragmatic, transpired, existential, contingent data and events one encounters in the historical record and the meaning of these data and events in the historical process. Its criterion of truth is measured by how well the historian reports "what actually happened," in Ranke's famous phrase. Historiography does not allow historians to make up facts imaginatively; it requires that they report accurately and interpret properly the kinds of facts that emerge within their specific line of inquiry.

Indeed, the different kinds of inquiry historians make result in a large variety of "facts" and an extensive variety of ways one can report what actually happened in history. One can never bridge the essential gap between history as actual events and history as the record or reporting of events. Historians must select their facts. Thus historians find their decisive facts in different areas and produce such varieties of historical writing as political, economic, constitutional, intellectual, psychological, and sociological history, to name some of the better known types. And if the typical history book combines several such types of history, one must still inquire into the order of priority given to the historical categories used in it. A historian like Marx, whose faith is in economic/historical materialism, will certainly produce a different order of "facts" than a St. Augustine, whose faith leads him to write a theology of history about a city of God and a city of man. And each, of course, will find an altogether different niche for the other's primary category of reality.

FICTION is governed by its central focus on possible events of human life and experience. It invokes imagination especially in its re-creation of the experience of human life. Here, too, we observe that the Latin **fingere**, with its past participle form **fictus**, tells us that fiction, like fact, is something "made up" in a certain way. Its facts and its plot are imaginative inventions, and its criterion of truth is verisimilitude, a fidelity to what is possible to and expressive of human nature and experience. Various blends are possible, such as the historical novel, which combines elements of what has actually happened in history with imagined elements of what could happen in human experience. Or, prospectively, imaginative fiction may include a heavy baggage of philosophical problems and challenges--such as in Dostoevski's and Faulkner's novels--but it must not treat them in the same way that formal philosophy does.

PHILOSOPHY in turn is governed by its central focus on the systematic rational inquiry into the existence and the meaning of everything actual and possible. It uses the instrument of human reason, primarily, to inquire into the existence and the meaning of all that is possible or actual, necessary and contingent. It asks, metaphysically, about what exists and how; it asks, ethically, about how we ought to act. Its instrument of natural reason admits only those answers that can justify themselves at the bar of reason. At the same time it faces a peculiar problem special to it: the nature of philosophy itself, for one of philosophy's major questions, the answer to which divides philosophers into a variety of types, has to do with what philosophy is and what it is supposed to do.

So histories, novels, and philosophies are inquiries into facts about reality in some way or other, but history does this in a predominantly mnemonic way, fiction in an imaginative narrative way, and philosophy in a professedly rational and cognitive way. Each is a construct of human experience, and each may occasionally stray into the other's territority, but each talks its own language and expresses human experience differently. Humanity talks in a variety of tongues.

Within each of the three disciplines, the course considers each book it examines on three distinct levels.

Level one addresses the "brute facts," or what the book is ostensibly about. In the areas of history and philosophy particularly, this may call for considerable background material. Reading Marx's **Civil War in France**, for example, calls for extensive background information about nineteenth century French politics, especially about the Franco-Prussian War and the Paris Commune. Similarly, reading Descartes' **Discourse on Method** will require some background on the European skeptical crisis in the sixteenth century.

Level two addresses the craftsperson's techniques and methods in writing a history book, a novel, or a philosophy book.

About a history book one asks such questions as the following: Why did the historian pick a particular topic to write on? What are the sources used? How close is the historian to those sources? What are the book's principal categories (economic, intellectual, diplomatic, etc.) and in what order of priority? What is the book's thesis? What are its main themes? What makes the book move? How does it explain change? Does it moralize? What periodization scheme does it use? On what basis? Are there any heroes in the book? What kind? How do individuals relate to groups in it? Is it primarily analytic or synthetic in treatment? How good a narrative is it?

About a novel appropriate questions include: What is a novel? What are its author's sources--experiential, literary, imaginary, etc.? How well-crafted is the plot? What kind of a plot is it? What kinds of characters does the book portray? Are they realistic? Stereotypical? Shallow or deep? Simple or complex? What are the main human passions, sentiments, moods, concerns, values, and motives dealt with? How serious are the issues raised in the book? How important is the setting of the novel, for example, a place like St. Petersburg or Yoknapatawpha? What are its author's artistic strengths and weaknesses? What narrative method is used? How vast or small a scope in time and space does it cover? How much, if any, symbolism, allegory, and myth does it use? Is the novel written to entertain, or to propagandize, or to effect social change, or simply to interpret and express life meaningfully?

About a philosophy work one would wish to know, for example: What is its author's idea of what philosophy is and is supposed to do? What is its author's main question or problem ["What's bugging him?"]? Is the author primarily a religious thinker or a mathematician or a political or social theorist or a cosmologist, or a linguistic analyst? How does his or her primary orientation accommodate other views? What method is used in the book? How vast a topic is addressed? How does the book address basic questions of metaphysics, epistemology, and ethics?

In the context of our six book selections, such questions may take the form of inquiring into matters like Thucydides' primary focus on human deliberation and persuasion in wartime, as evidenced in his meticulously crafted speeches, in contrast with Marx's more exclusively economic-materialist approach whereby "the hand-mill gives you society with the feudal lord; the steam mill, society with the industrial capitalist"; or the advantages and disadvantages of using an interior monologue narrative method (Faulkner) in preference to the omniscient narrator method (Dostoevski); or the effects of Descartes' essentially mathematical/geometrical approach to philosophy in contrast with Plato's dialectical and even (at times) mythological methods.

Level three (which overlaps level two in many respects) addresses the issue of the authors' implicit and/or explicit worldviews and views of human nature. Students are advised to note the special importance, particularly in history and philosophy books, of authors' introductions and prefatory remarks--for clues they might generally tend to ignore. Special heed is paid to such issues as whether authors give evidence of belief or disbelief in God; how they would define or describe "the good life;" whether they are libertarians or determinists; what kinds of explanations explain for them; what they regard as good and evil; how they view the meaning of the historical process as a whole; how they relate faith and reason in life and history; what they think about the soul and immortality; their views on conscience; what authority is ultimate for them; what kinds of heroes (if any) they recognize, and so forth.

It is possible, in fact, to raise a virtually endless stream of questions of this kind about the works studied. In very general, yet crucial, terms, where and how does each author draw the distinction between "reality" and "appearance" in his or her book? How can a Dostoevski be so profoundly philosophical in fiction that a Russian philosopher calls him "Russia's greatest metaphysician"? How big a risk of didacticism does he run within the realm of fiction? Assuming that he is bent on raising serious philosophical issues, exactly how and why must he deal with them in fiction? Why does a philosopher like Plato use myths in his speculation, and why is it that other philosophers view him so contradictorily as belonging either in the first rank of philosophers or as no philosopher at all, but a mystic? How heavy an impact does Marx's worldview have on his analysis of the pragmatic events of a civil war? To what extent, if any does his passionate personal involvement in those events vitiate his historical interpretation? Can we really find out anything worthwhile about Thucydides' own worldview and view of human nature, given his extreme self-effacement in writing? How much do authors divulge about themselves solely in terms of the topics they treat, the categories they employ, the assumptions implicit in their methods, and so forth? What makes a history book, a novel, or a philosophy book "great"?

These and many similar questions are raised continually in the course, both within and across the disciplines. And each of them is answered somewhat differently from discipline to discipline, as required by the special logic of each, or within each discipline, as required by the distinctive methods and preferences each practitioner of a discipline manifests in his or her work.

These main elements of comparison and contrast between and within the areas of history, fiction, and philosophy are what make this course specifically interdisciplinary. For they distinguish this humanities course not only from the three disciplines it embraces but from a mere addition or juxtaposition of them.

From this perspective the actual materials studied in the course--the six books named above--seem to be reduced to the status of mere byproducts of the course. Yet they are much more than that. For if the course is intended to teach students how to read history, fiction, and philosophy critically, this assumes that the game is worth the candle, that is, that worthwhile or "great" books are of serious value in themselves. It is to learn how to read these kinds of books critically that the course exists at all. Most of the course deals with the historical/fictional/ philosophical materials themselves: what they say, first of all, as well as how to read them critically. The strong concrete appeal of these works themselves are what prevents the course from becoming bogged down in arid theory and constitutes its main appeal and justification.

While this course has a specific rationale or controlling idea of the sort described, this rationale is not tied to the selection of the particular materials I have named above. We encourage teachers to play to their own strengths and preferences and to select their own materials to illustrate the points to be made in the course. We can advertise and deliver essentially the same pedagogical package without being restricted to a rigidly fixed list of specific materials.

Students enjoy this course, even when they occasionally laugh about its being "heavy" in content or treatment. When they find that they will receive, well in advance, a list of the essay questions that make up their two mid-term exams and their final exam and that they may use their course books during these tests, their initial reaction is that the course will be very easy. That exuberant anticipation is soon tempered by the realization that they are being challenged to do some serious reading and thinking about some of life's thorniest and most significant issues to address those questions. They are challenged to formulate well-conceived and organized answers to those questions, and in doing so to make a judicious selection of source materials to support their arguments. In short, they are challenged not only to read critically, but to make a critical statement about what they have read, with appropriate emphasis on what history, fiction, and philosophy have in common and how they differ as expressions of human experience.

As just noted, we supply students with specific advance information about each approaching test in the course. We are more than willing to remove the fear of the unknown for them, asking in return that they focus on serious reading and reflection so that they can make an informed personal statement about each question. In other words we want their test preparation to be primarily a learning experience for them.

The great common denominator in this kind of humanities course is naturally human nature itself. Each humanistic activity and construct sheds a special kind of light on human interests, values, preoccupations, and commitments. Each "objectification" of human experience these constructs represent is a concrete instance of the perennial human search to express oneself and to discover oneself in human creations.

While no humanist realistically expects to reduce human beings and human activities to a formula or group of formulas, the sort of interdisciplinary endeavor described here seems to promise us more help in understanding humanistic expressions and their producers than any purely extrinsic grouping of humanistic departments or personnel or subject areas can do. We feel that in this course, and in some others like it, we are offering students not just a multidisciplinary treatment of the humanities but a truly interdisciplinary one, one that moves them toward a deeper understanding of the things people do, of their inner dynamics and mutual relationships. And we trust that such deeper understanding will help us to know ourselves better, as individuals and as a human family.

HUMANITIES EDUCATION CONNECTIONS

Ideas and materials for better teaching and learning in the humanities.

Diana C. J. Matthias

OBJECT-ORIENTED EDUCATION: 3. IMAGES OF NATURE IN LITERATURE AND PAINTING

This article describes a lecture tour given at The Snite Museum of Art, University of Notre Dame, which was requested by an English professor for an honors Freshman English class. In the course description the professor wrote;

> *The core of this course is a group of eight or ten books, mostly written by Americans since the 1840s, plus a couple of films and some paintings. The issue uniting these works is "Nature". For the past two hundred years, Nature has been one of the principal mirrors in which human beings--Americans especially--have seen their own image and situation. Some of the questions we will take up are: What does "Nature" the word, mean to each of these writers? What does nature, the reality, mean to each of them--if it means anything at all? What is our relationship to nature? What should it be? --active? contemplative? reverent? careful? belligerent?*
>
> *Books include: Henry David Thoreau,* **Walden***; Emily Dickinson,* **Poems***; Charles Darwin,* **Darwin** *(edited by Appleton); Robert Frost,* **Poems***; Ernest Hemingway,* **The Old Man and the Sea***; Willa Cather,* **Five Stories***; Annie Dillard,* **Pilgrim at Tinker Creek***; Loren Eisley,* **The Star Thrower***; N. Scott Momaday,* **House Made of Dawn.**

The aim of the program of Curriculum Structured Tours is to make The Snite Museum of Art an integral part of the educational process for students in the College of Arts and Letters. This is usually accomplished by establishing a dialogue between the works of art themselves and the readings of each class. The professor and the museum educator decide on which ideas to use, and which works of art will exemplify these ideas during a meeting prior to the class visit. At this meeting the museum educator and the professor discuss the syllabus and choose the objects which will be used for the class presentation. This discussion ensures that the material presented and the ideas discussed will be relevant to the class. Usually the museum educator must read some of the books on the syllabus in order to be able to present the ideas clearly, and to be able to make useful comparisons and contrasts between text and visual art.

We decided to begin the lecture tour on nature by looking at images painted in Europe during the seventeenth century. We wanted to demonstrate how seventeenth century ideas of nature formed an important background to nineteenth and twentieth century ideas. We also wanted to show the way in which both painters and writers often quote from and refer to traditional ideas in painting and literature. The first image of nature which we examined was **Rest on the Flight into Egypt** by Claude Lorrain (1600-1682). In accord with the course description, some of the ideas we needed to discuss were: What did nature mean to Claude Lorrain? What did it mean to his patrons? Is humanity's relationship to nature in the painting active, contemplative, belligerent, or something else not mentioned in the course description?

In order for the students to be able to answer these questions it was necessary to provide some background to this painting. When he was eighteen Claude Lorrain moved from northeastern France to Rome, where he painted for wealthy international patrons who either lived in Rome or visited the city on their Grand Tour. In his work for this influential clientele Claude popularized a particular type of landscape which was based on variations of his own careful observation of the countryside around Rome, the Campagna.

Keeping this brief introduction in mind, the students could now begin to think about Claude's own attitude toward the nature he painted. They noticed that he had placed the Holy Family in the Roman Campagna, and they observed correctly that it looked as if a depiction of a classical landscape was far more important to Claude and his patrons, than an accurate geographical and historical account of the Holy Land or Egypt. They agreed that Claude must have used this type of classical landscape scene because it was what both he and his patrons loved. The students felt that Claude's paintings were examples of his being in the right place at the right time--he wanted to explore the possibilities of Roman classical landscape, which was what his patrons wanted to look at on their walls in northern France or England. So Claude had several simultaneous attitudes to nature: an active attitude in that in his paintings he embellished and changed what he actually saw, a contemplative attitude in that he studied and revised his ideas repeatedly, and a money-making attitude in that he earned his living from painting the Roman Campagna. In order to explain the attitude toward nature of Claude's patrons, I mentioned the classical studies which would have formed the basis of seventeenth century aristocratic education, and institutions such as the French Prix de Rome. This type of education encouraged the belief that no studies could be complete until a visit to Rome had been accomplished. This short background on patronage allowed the students to understand that owning pictures of the Roman Campagna usually demonstrated that a person had enough money to visit Rome to buy the painting and to complete his education. He had also refined his taste so that it included this particular type of landscape and its implications.

Next we examined the painting in order to understand the relationship between humanity and nature which Claude had depicted. The categories to be discussed had already been mentioned in the course description: Was humanity's relationship to nature active, contemplative, belligerent or something else? The students correctly observed that Claude had depicted a harmonious relationship between man and nature. **Rest on the Flight into Egypt** is a peaceful scene in which no natural phenomena such as storms, high winds or cold weather threaten the relaxed attitudes of the Holy Family. The undisturbed surface of the river behind them seems to echo the contemplative mood. In order to explain that the contemplative attitude probably referred to the classical ideal so popular in the seventeenth century, I quoted a passage from a letter by Nicolas Poussin, Claude's compatriot in Rome:

> *But first about subject matter, it must be noble and not have taken on any common quality so that the painter may show his spirit and industry. It must be chosen so as to be capable of taking on the most excellent form. The painter must begin with disposition, then ornament, decorum, beauty, grace, vivacity, costume, vraisemblance, and judgement in every part. These last qualities spring from the talent of the painter and cannot be learned. They are like Virgil's Golden Bough which none can find or pick, unless he is guided by destiny.*
>
> (**Nicolas Poussin**, by Anthony Blunt. Bollingen Series XXXV 7.Pantheon Books.1967.p.355.)

Another important aspect of the contemplative attitude to nature is the philosophical background. We mentioned that classical political ideas were not concerned with actual events, but rather with the right and best political order. Base passions should be ignored in favor of reason and virtue. In order to illustrate these ideas painters traditionally depicted man in his most heroic moments. Scenes from ancient history, myth and the Bible were commonly chosen as suitable subjects for paintings. We noticed that Claude seemed to be more interested in nature then in people's heroic deeds. The point was then made that some painters such as Claude and Poussin began to stress nature at the expense of figures, and that this developed into a trend which continued until landscape was made an officially acceptable genre by the French Academy in 1816.

These references to the well-known classical ideal relationship between humanity and nature are not the only ways in which Claude evokes the past. By asking a series of carefully considered questions, I was able to encourage the students to describe the ways in which Claude refers to both the idea of nostalgia for the past, and to an aesthetic idea which became popular in eighteenth century England, the Picturesque. The class noticed that Claude refers to the past firstly through his subjects, the Holy Family, who recall the Roman period in which they lived, and secondly through the time of day, sunset. We discussed Claude's fascination with dawn and dusk, moments which people have always found beautiful and nostalgic because they recall the passage of time and are of short duration. The students next mentioned that they saw another moment of time referred to by Claude in the ruined castle. We were now aware of two historical periods, the Roman and the medieval. When we considered the significance of the castle's being a ruin rather than a perfect and complete structure, the students gradually came to see that we were looking at an early example of a new aesthetic taste. The ruined castle implies that an old building which bears the marks of wind and weather, inspires thoughts of mortality and gloomy imaginings. So it is the ruin and its use in the eighteenth and nineteenth centuries as an important ingredient of the Picturesque and Romantic movements, which allows the viewer to consider time by looking both backward into the past and forward into the future.

We continue our discussion of Claude's **Rest on the Flight into Egypt** by referring to one of the English professor's categories not yet mentioned with regard to this painting, the active attitude. One could not expect freshmen to know about the way in which the rich eighteenth century landlords used their Claude paintings as a model for their landscape gardening. This was however, an "active" manifestation of humanity's relationship to nature which occurred in England, and to a lesser extant in France, in this period. To support this assertion I quoted from Christopher Thacker's **The Wildness Pleases** (St. Martin's Press, New York. 1983. p. 34):

> *And the landscape paintings which Addison probably and later gardeners certainly, had in mind were scenes of the Italian countryside, wooded, hilly, adorned with a ruin or two, peopled by men and women wearing the clothing of another age, and taking part in stories from ancient history and older myth. These pictures--by Claude Lorrain (1600-1682) and Gaspard Dughet (1615-1675)...were studied, bought, copied and imitated throughout the eighteenth century...most of the "new" gardening, and much of the new writing and thinking about nature reflected their attitudes and ingredients.*

The resulting type of landscape architecture, "actively" created from painted examples, was a garden such as the one created at Stowe by William Kent. The class was then shown a photograph of this well-known eighteenth century garden so that they could see the way it looks today.

The second work we looked at was a Flemish painting, **Shipping on a Rough Sea** by Andries van Eertvelt (1590-1652). In contrasting this view of nature with that of Claude, the students commented immediately that in this painting there was no ideal relationship felt between humankind and nature, nor was there any interest in a nostalgic evocation of the past. The painting depicts the actual danger and threat posed by nature to sailors involved in international trade. It was necessary to mention here that these categories of "fear" and "threat" were very similar to the idea of "horror" and "astonishment" which became the ingredients of Edmund Burke's concept of the sublime:

> *The passion caused by the great and sublime in* nature*...is Astonishment; and astonishment is that state of soul, in which all its motions are suspended, with some degree of horror. In this case the mind is so entirely filled with its object, that it cannot entertain any other, nor by consequence reason on that object which employs it.*
>
> (**A Philosophical Enquiry into the Origin of our Ideas of the Sublime and the Beautiful.**1757. ed. James T. Boulton, 1958. p. 57.)

I added that we would see a nineteenth century version of the sublime in nature when we looked at another painting later. Several students used their professor's chosen categories when they said that this Flemish painting showed not only nature's active relationship with humankind, but also nature's seeming belligerence and cruelty to us. The destructive power of nature is evident in the way the wind and the waves drive the ship to its destruction on the rocks. Other types of contrasting elements found in this painting were the powerlessness of the small sailors swimming and rowing in the overwhelming sea. Nature's destructive power is shown by stressing the size of the waves and the force of the wind. The students then found several other ways in which contrast is used to heighten dramatic effects, such as the use of still versus moving objects, and vertical versus diagonal lines.

Now that we had looked at two very different visual depictions of humans and their relationship to nature, it seemed appropriate to introduce the first of the texts which this class was studying. As we were considering the ideas in a seascape, Hemingway's **The Old Man and the Sea** was the obvious reading to use. We had already established that the seascape showed us nature as active and belligerent, now I asked if Hemingway describes the sea and nature in a similar or a different way. One student remarked that Hemingway refers to the sea and nature as sometimes kind and at other times belligerent, and that Santiago, the "old man" of this novel, identifies these characteristics of the sea as feminine when calm and masculine when rough. We all agreed that this idea of attributing sexual identity to the changing aspects of the sea was much more likely to come from a Spanish speaker such as Santiago, who would think in terms of all nouns being masculine or feminine, than from a comparable type of English-speaking fisherman who would think of all nouns as neuter.

The idea which I wanted to introduce next was **work**, the necessity for earning a living, and whether a person's need to work with the elements would allow him to have an ideal appreciation of nature. In order to approach this idea I asked the students to find the most striking difference between the people depicted in the two paintings which we had looked at. Very soon the concepts of rest and work were mentioned, and gradually I guided the discussion towards seventeenth century patronage and the difference found between the emerging capitalist and mercantile states of Flanders and Holland, and the more static, aristocratic systems found in France and Italy. In response to my query as to why the ideal and nostalgic scene depicted by Claude might be more popular among the aristocratic French, English and Italians of the seventeenth century, the students answered that Claude's subject posed no threat or change to the established status quo. This was perhaps one subconscious reason for the popularity of this style. The most important conscious reason, the one which would have been articulated by the wealthy patrons themselves, would probably have been that a painting depicting the classical ideal showed humanity's highest aim. Most educated people in the seventeenth century believed that the aim of both art and life should be to rise above earthly existence, to escape from base passions, and to live for virtue and reason. They believed that only by overcoming the particular and the mundane could people become civilized and properly human. This "classical" ideal lasted as a common aim in the more static, feudal regimes of France and Italy for considerably longer, than in the nations of Holland and Flanders where social life was changing

In order to return to our Hemingway text we needed to distinguish what kind of work we saw depicted in the Flemish seascape. We found that what we saw was teamwork, namely sailors working a ship--one of the most ancient and skilled types of teamwork. Next I asked if teamwork was mentioned by Hemingway in **The Old Man and the Sea**. Several students remembered Santiago profoundly misses "the boy", and the cooperative teamwork they had developed in sailing and fishing together; repeatedly Santiago says, "I wish I had the boy." The students also remembered the two images which support Santiago in his lonely battle with the great fish--Joe Dimaggio and the American baseball teams, and the dreamlike image of a group of lions approaching their evening watering place. In his longing for help during his solitary battle with the great fish, Santiago bolsters his flagging spirits with thoughts of teams which work together effectively.

My hope in comparing and contrasting the two seventeenth century paintings and the Hemingway text, was that the students would learn to distinguish more carefully between various attitudes to nature, whether visual or verbal. The Flemish painting of a shipping disaster and Hemingway's novel both describe men who need to work with nature in order to make a living. We noted that the Flemish interest in work and the mundane was precisely what the educated French and

Italians felt should not be used as the subject of a painting. This interest in work and the commonplace coincides with the rise of capitalism and the bourgeoisie in Holland and Flanders. In his book **New Images of the Natural in France** (Cambridge University Press. Cambridge. 1984. p.209) D.G. Charlton comments on the seventeenth century Dutch and Flemish interest in the ordinary, "Quite early in the seventeenth century Dutch art was already depicting the everyday and the commonplace. In a Protestant land, with undecorated churches, religious subjects were little in demand, whereas to a quite unusual extant, the owners of ordinary homesteads wished paintings for their walls." In fact Van Eertvelt's painting shows a combination of interests which become ingredients of the Romantic movement, notably the lives of lower class people, mundane episodes, and events depicting particular historic moments. We agreed that these were also the ingredients of **The Old Man and the Sea**, which made it into a Romantic novel. Finally we considered my earlier question about whether a person who is actively involved with nature, such as Santiago or the Flemish sailors, could have an ideal view of it. We concluded that a certain distance from nature, the ability to look at it from a safe and uninvolved position, was necessary for an ideal view of nature. This meant that Claude's patrons would have been wealthy enough to insulate themselves from the wildness of nature, and thus they could have maintained an ideal view of it. We felt that the Flemish sailors and Santiago on the other hand, had probably developed a deep respect for nature through their work. This feeling of respect would have been based on intimate experience and would have excluded an ideal view of nature.

The third section of this lecture tour took place in the nineteenth century gallery where we examined a painting by the American painter Albert Bierstadt while considering some descriptions of nature by Henry David Thoreau. In **Sunset over the Grand Tetons** (1862) Bierstadt has depicted mountains and a golden sunset sky reflected in the calm surface of a river. In the foreground, three Indians silhouetted against a dark mountainside, are approaching the riverbank. In order to provide a context for this painting and before asking any questions, I mentioned that Bierstadt had trained in Germany, and spent several years travelling in Europe looking at well-known collections of art. Then I asked if the students could see if Bierstadt was using a style which they had already encountered as a model. They responded immediately by finding comparisons between Claude's **Rest on the Flight into Egypt** and the Bierstadt painting. The similarities which they found were: small silhouetted figures, an outcrop of rock which defines the middle distance in the same way as Claude's castle, calm reflective water which creates a central area of flat recessive space, a dark framing device in the foreground (in Claude's case this was a group of trees, in Bierstadt's it was a very large rock), distant mountains and a golden sunset sky. (cf. **Nature and Culture**. by Barbara Novak. Oxford University Press. New York. 1980. p. 228.) When I asked if Bierstadt was making any reference to humanity's feeling of awe for nature's power, the students realized that although Bierstadt's mountain scene was outwardly calm and harmonious, like the Claude, in fact the mood of nature had been subtly changed. The students commented that this change had been effected by bringing the mountains much closer to the foreground of the painting, so that the viewer becomes more aware of their size and dark ominous qualities. In the nineteenth century the appreciation of "greatness," as discussed by John Ruskin, was a more prevalent attitude towards nature, than the excitement of the destructive element which we had seen in the Flemish painting, and the peaceful harmony of Claude; "...Elevation of mind is produced by the contemplation of greatness of any kind... Greatness of matter, space, power, virtue, or beauty, are thus all sublime." (**Modern Painters by a Graduate of Oxford.** 1843. Reprint New York. John Wiley and Son. 1868. Vol. 1. p.41. Quoted from **The Natural Paradise**. Painting in America. 1800-1950. M.O.M.A. New York. 1976. Catalogue.) We agreed that although Bierstadt seemed to have used the seventeenth century Claudian model for the design of his painting of the Grand Tetons, and although the Indians he depicts appear to be quite at ease in their sublime surroundings, the viewer is made very aware of the grandeur of nature, and the potential danger and threat to mankind posed by mountain regions. Bierstadt has added a typical nineteenth century component to his scene of man and nature, his insistence on nature's grandeur.

We returned to the particular concerns of this class by asking ourselves if we saw a contemplative or belligerent attitude to nature manifested in this painting. The students found that both ideas were present. Painters such as Bierstadt and writers such as Thoreau popularized the sublime and contemplative attitudes. But, it is their possible influence on the "active" attitude which is the most interesting in the late nineteenth century. The situation at this particular historic moment was that much of the wild beauty of the North American continent was being destroyed by the actions of "manifest destiny," and native Americans were being rounded up and killed. This loss of large areas of natural wilderness to "development" finally resulted in an understanding of the significance of the loss, and the founding of the first National Park at Yellowstone in 1872. This was an opportune moment to mention that people tend to appreciate an aspect of life only when that element is seriously threatened. In the second half of the nineteenth century Americans knew that much of the natural beauty of the United States was being dramatically changed for various economic reasons. It is very possible that paintings such as **Bierstadt's Sunset over the Grand Tetons** had a positive effect, an "active" influence, in the terms of the categories being considered by this class. This type of landscape painting may have caused a wish to preserve this kind of nature, which was then translated into the "action" of forming the first National Park.

In order to conclude this section of the lecture tour I read an extract from another assigned text, Thoreau's **Walden**. This passage is particularly relevant because it refers to a stretch of water which Thoreau describes very much in the manner of Claude and Bierstadt. Thoreau stresses the importance, perhaps as a healing agent for those of us who are made miserable by man's belligerent attitude to nature, of the contemplative and ideal attitude:

> *In such a day, in September or October, Walden is a perfect forest mirror, set round with stones as precious to my eye as if fewer or rarer. Nothing so fair, so pure, and at the same time so large, as a lake perchance, lies on the surface of the earth. Sky water. It needs no fence. Nations come and go without defiling it. It is a mirror which no stone can crack, whose quicksilver will never wear off, whose gilding Nature continually repairs...a mirror in which all impurity presented to it sinks, swept and dusted by the sun's hazy brush.*
>
> (**Walden.** by Henry David Thoreau. 1854. Reprint New York. Mentor 1942. pp/ 128-129)

In this article I have only had the space to describe a segment of a lecture tour. In the final portion I used native American works of art, some poems by Emily Dickinson, and an excerpt from **House Made of Dawn** by N. Scott Momaday. It is to be hoped nevertheless, that this shortened version has been able to make clear some of the possibilities and advantages found in presenting students with their visual tradition. Many people are unaware that there is such a thing as a visual tradition, but when it is pointed out to them by using the vehicle of their own particular studies, it becomes a living part of their knowledge. This method of combining a study of visual art and texts allows people to understand that ideas do not exist in a vacuum. They see how the repeated comparisons made between images and texts from the past can become a springboard for understanding the present.

WHERE CAN I DO GRADUATE STUDY IN HUMANITIES?

In terms of design format and probable appeal to quite different temperaments, graduate study in Humanities may be said to range between the program at the University of Chicago and that at the University of Richmond. Also, between those two poles there are enough intermediary programs to guarantee an appropriate choice for any Humanities major who wishes to enter graduate school.

First, a few generalizations may prove helpful. Research sources list among them twenty-seven universities offering Humanities study at the Master's level. Ten of these prove upon investigation to have a Master's Degree offered by a structural body within the university labeled "Humanities Division" or like description. There is no interdisciplinary Humanities concept involved. Bridgewater State College, Wayne State University, the University of Arkansas, and Ohio State University (Columbus) are in this category. Furthermore, Master's Degrees come in three different nomenclatures to appeal to different clientele. The Master of Arts in Teaching obviously has K-12 and junior college faculty in mind. The Master of Arts with a major in Humanities is tailored to a less professionally specified group and one most likely to continue in pursuit of doctoral status. Literacy in one or more languages is typically required, along with a mandatory thesis and its attendant oral exam. A third designation, the Master of Humanities, also crops up. It is obviously the less scholarly option at the University of Dallas (Irving, TX), where it requires neither thesis or foreign language. (The regular M.A. is also offered there.) However, this is not universally true, as the complex, obviously scholarly program at the University of Richmond carries the Master of Humanities designation.

The Master of Arts in Humanities degree at Louisiana State University (Baton Rouge) sends up a red flag which we should note. This degree is for "mature part-time students" and seems to be directed toward the clientele for which the Master of Liberal Arts was designed. Xavier University, which has no required thesis or language competence, describes its Master of Arts in Humanities honestly as "for personal growth." It would seem poor service to the meaning of Humanities to let its designation be used for such purposes when there is the other more universally recognized label available.

As to who runs these programs, the dominant pattern seems to be that of a coordinator with a group of faculty largely drawn from traditional disciplines who are cooperating in some unspecified manner to pull the program off. There are variations even here, as the program at the University of West Florida seems under the control of the philosophy faculty, while at Hofstra the art historians are in command.

Qualifications for entering the graduate program are similar, usually presupposing an undergraduate major in some Humanities discipline. Arizona State University will accept a major in any NEH listed discipline, but will also consider someone who majored in social or natural sciences. The University of Colorado (Denver) requires simply 40 hours in any and all Humanities disciplines in one's undergraduate experience. Hours required for a Master's Degree are even more standard, 30 plus a thesis or 36 without.

When we get to the question of the design of a graduate program, differences among institutions become profound. Far and away the loosest, most individualized program is at the University of Chicago. An entering student is assigned to the large, varied committee of faculty from disparate disciplines which has agreed to function together to direct academic study under a compatible rubric. Those collations which seem particularly apt for someone in Humanities are the History of Culture, the Analysis of Ideas & Study of Methods, the Ancient Medieval World, or General Studies in the Humanities. The stated goals of such study: competence across varied Humanities disciplines, deeper understanding of at least two of these disciplines, and original work in independent pursuit of a significant problem, seem quite clear and specific. However, one is to attain them via experiences listed only as "seminar" or "directed reading." It would appear that if the student and committee agree upon an array of activities and outcomes, that agreement constitutes the degree program.

At the other extreme is the highly specified program at the University of Richmond. Two core courses, the Greco-Roman Basis of Western Civilization, and the Judeo-Christian Basis of Western Civilization, form the required first element. Then the student elects four courses from a large array in unit two, including Greek Drama, the Foundations of Modern Art, Nineteenth Century British Literature and Social Thought. Four courses are required from a third unit which lists such entries as Urban Life in America, Literary Criticism, Contemporary Theology, and Artists, Creation, and Esthetics. Besides this array of riches, other courses may be used as electives, for example, Greek philosophy, myth, Judaism, religion and personality, and many others.

Most graduate programs fall somewhere between these two extremes. They typically have a few core courses that all students must take and resort to offerings in constituent disciplines to fill up the rest of the program. This is especially a good plan for teachers who have to show specific field competency to maintain certification. Florida State University offers two Master's programs, one which they designate as a "liberal studies" degree, and the other jointly administered with the College of Education for people who wish to teach at the junior college level. This latter consists of nine hours in professional education courses, nine in the field of the undergraduate major, and nine in one cultural period as offered by two different departments. Holding both Master's plans together are three seminars focussed upon Western cultural history, and one seminar on fine or performing arts.

Xavier University uses "The Human Search for Meaning and Value" as the initial, integrating study, adding a four course sequence in the Western Intellectual Tradition, and finishing with the Language of the Humanities (see Joseph Wessling's "Teaching the Language of Humanities," HE, Spring 1988) as the central shared core. Brigham Young University has one period course and one topic course as the unifying agents, with the remainder of the program coming from electives in constituent Humanities disciplines. Arizona State

University mandates Comedy: Meaning and Form and Tragedy: Meaning and Form with two courses in the Interpretation of Culture as the essential core of that program. San Francisco State University has a four unit program consisting of three seminars (Foundations of Integrative Study, Humanistic Themes, and Culture and Style) six electives centered on major works, historical periods, themes, regional studies, or interrelationships among disciplines. The remaining two units are the foreign language or auxiliary skill (performing art, computer language, etc.) and directed study/thesis and defense.

There are some interesting wrinkles caused by the history or limitations of the institution housing the degree. Johns Hopkins has a strong honors program on the undergraduate level, and there is an option for attaining the M.A. in Humanities along with the B.A. Otherwise, that program is about on the level with the University of Chicago in its individualization. Hofstra University fudges on the lack of adequate, varied graduate courses by allowing courses numbered 200 or above to attain graduate credit toward the M.A. degree. All the required core is at the 200 level! If one is searching for the right Master's program, the ones that look most interesting are:

> *Arizona State University, University of Colorado (Denver), Florida State University, University of Chicago, University of Louisville, San Francisco State University, University of Richmond, University of Dallas, and Xavier University.*

Now, for the academically talented who can handle the PhD Degree, there are just four choices and somewhat less variety than in the Master's design: Florida State, Stanford, University of Chicago, and Johns Hopkins. With most of these choices the curriculum described under the Master's Degree is the core constituent of the PhD program. At Florida State, for example, there is the three course Western Culture sequence all graduate students take. There are additional offerings in comparative literature and intellectual history. By far the largest block of course work (18 hours) is taken in a single discipline area, but another block (12 hours) concentrates on one cultural period or movement by cutting across disciplines. There is also a very attractive Asian Studies program that can be integrated with the Humanities curriculum.

Stanford University makes it very plain that Humanities supplements but does not substitute for departmental specialties. The PhD is always a joint degree (Classics-Humanities, English-Humanities) and the student must register in the department rather than in Humanities per se. The design of the core follows the Western culture-history sequence, first in three courses at the undergraduate (300) level and then in six courses at the graduate level. "The Theory of Humanities and the Function of the University" is the capstone course for the design which should occupy about half of an entire PhD program. The remainder is presumably devoted to the single discipline and the dissertation.

The University of Chicago PhD program is the same as the Master's program, simply more extensive and at greater depth. The design is a matter of negotiation between the student and the committee under which he or she has chosen to work. Johns Hopkins offers two areas of concentration for the PhD, comparative literature and intellectual history. Within this general focus, one may choose to concentrate upon a time period, a specified theme, or an idea as it operates across varied cultural contexts. Judging by their academic credentials, the bias of the supervising committee is largely literary, with political science and psychology strongly represented.

While graduate study in Humanities has nothing like the availability of English, or history, or any of the staples of the academic diet, nevertheless, there are good programs in every area of the country. There is also the diversity needed to fit varied student needs and personalities. There are some real pitfalls that should be recognized: a few programs may be more like continuing education, "adult enrichment" offerings than solid academic exercises; a few may depend too much on the changing climate of a conglomerate committee for students who need a greater degree of certainty. Directors of undergraduate Humanities programs should obtain catalogues from at least those universities listed above to use in guiding students toward the best choice for their situations. There are undoubtedly other graduate programs that have strong Humanities components but were not listed in standard sources under that rubric. **Please let us know of any programs you have discovered that should be added to our recommended list.**

LIBERAL EDUCATION & TRANS-CREATION OF THE PAST

"In the country of the blind," wrote Erasmus, "the one-eyed man is king." For this reason, as Voltaire once remarked, "All the known world, excepting only savage nations, is governed by books." And in our age of international trade and commerce, worldwide travel and migration, of marriages between men and women of different religious, linguistic or cultural backgrounds, "He that walketh with wise men shall be wise" (Proverbs 13:20). Why so? Because the writings of the wise are the only riches our posterity cannot squander. He who overcomes by force overcomes only the bodily portion of that conjunction of Mind and Body which constitutes a human being. Hence also, he who looks for inspiration **only** in a religious or cultural **past**, may take comfort in the belief that "righteousness shall look down from heaven" (Psalm 85:11-12); but the very same psalm reminds us of the equal importance of the **present**--of what is **new**--when "truth shall spring out of the earth." So **why** do we study the classics? Answer: In order to ponder the wisdom of the past. And **how** should we study our "heritages from the past?" We must do so in the manner of free citizens of a pluralistic society where, as John Milton reminded us, "None can love freedom heartily but good men; the rest love not freedom but license."

History, anthropology, psychology and linguistics tell us how (1) Cultures make Humans and (2) Humans make Cultures.

Cultures make humans because we are a "time-binding" species of "compulsive communicators," and to communicate we must acquire some medium for communication--some language--from our parents and their society. In our early stages of learning, "Monkey see, monkey do"--imitation--is the first and most basic way of learning. At this pre-school level of learning, an eagerness to share with, and a passive reception of the linguistic and ritualistic **mores** of a community by each infant born into that community gives rise to the **half-truth** that "Culture makes Humans." The mind is analogous to a "bucket" into which its culture's ways of thought and behavior are poured. But "Culture makes Humans" is only a **half-truth** because human selves are not all made of exactly the same mold. Einstein was nearly four years old before he first used language, whereas John Stuart Mill could speak in English, Greek and Latin at the same age. And as the biography **The Education of Helen Keller** makes clear, the ways a blind child learns are very different from the ways most of us transform ourselves from infancy to maturity. Yet in all cases, learning should conjoin a sense of personal individuality and dignity with an equally strong sense of social responsibility. But social responsibilities are not the same in all societies. Consider, for example, how greatly twentieth-century thought and behavior have been changed by the following 18th inventions:

Seed-Planting Drill (Jethro Tull, 1701)
Hard Paste Porcelain (Johann Bottger, 1708)
Iron Smelting with Coke (Abraham Darby, 1709)
Steam Pump (Thomas Newcomer, 1712)
Threshing Machine (Michael Menzies, 1732)
Flying Shuttle for Weaving (John Kay, 1733)
Sheffield Silver Plate (Thomas Bolsover, 1742)
Beet Sugar Extraction (Andreas Marggraf, 1747)
Mayonnaise (Due de Richelieu, 1756)
Spinning Jenny (James Hargreaves, 1768)
Improved Cannon Borer (John Wilkinson, 1774)
Winnowing Machine (James Sharp, 1777)
Modern Water Closed (Joseph Bramah, 1778)
Mill-Rolled Iron (Henry Cott, 1784)
Chlorine Bleach (C. I. Berthollet, 1785)
Power Loom (Edmund Cartwright, 1787)
Cotton Gin (Eli Whitney, 1793)
Improved Lathe (Henry Maudslay, 1800)

Add to these such 20th century "novelties" as automobiles and airplanes, radio and television, computers, improved telescopes and microscopes, and we can see why "the classics" (whose authors had no knowledge of such things) need to be not merely "translated" (e.g., from Greek or Latin into English) but also **"trans-created"** in ways that make them meaningful to people living today.

This process of "trans-creation", or of "reconstruction" is not unique to our age. In "The Passing of Arthur" Alfred, Lord Tennyson wrote:

> *The old order changeth, yielding place to new;*
> *And God fulfils himself in many ways,*
> *Lest one good custom should corrupt the world*

Gadgets, techniques and mass-production technologies have given us leisure and freedom far exceeding that of today's Third World peoples or that of our own ancestors a few centuries ago. But gadgets and technologies are not ends in themselves--except to specialized technicians who help others to use them. They become truly meaningful and humanizing only in so far as they enable more and more people to enjoy the enduring values of intelligence, freedom and integrity.

A frontier child, completely devoid of what we call "schooling", learned naturally that only in fair weather can one prepare for rainy days, and that fall harvests require spring plantings and laborious summer tillings. Our TV-educated children have no such "natural" teachers. Indeed, even before entering kindergarten, a typical American child will have been bombarded by tens of thousands of TV commercials saying that for any and every one of life's problems there is a quick and easy solution --a drink, a cereal, a pill or a gadget which --for a price--will satisfy each and every desire or need.

A liberal education provides no such easy solutions, because it generally deals with problems for which there are no quick and easy answers. Just as Socrates quite deliberately tried to create tensions in the minds of those who chose to listen to him, so that they could escape the bondage of half-truths, myths and old wives' tales, so should a modern "pedagogical gadfly" create a sense of tension, a dissatisfaction with one's present level of understanding or commitments, that may perhaps stimulate the learner-reader to reach out for newer higher levels of understanding and of commitment.

In the lower species of life, new combinations of parental genetic traits, plus an occasional (say, 1 in 50,000) brand new transmitable trait, have with time, enabled these "slightly modified" transmitters to adapt to different climates and environments. Similarly, though in much shorter time, new insights and discoveries of creative thinkers have made it possible for the human species to live in all regions of the world. We, the living generation, enjoy these many innovations and adaptations because we live by dialogue, not by monologue. Bergson called evolution "creative." Teilhard de Chardin delineated three levels of reality: the **geosphere**, the **biosphere**, and the **noospheres**. David Attenborough characterized us as a "time-binding" species of "compulsive communicators." Which means that, unlike the **drosophila** (fruitfly) or other species of plants and animals, we **deliberately** and consciously fashion our lives.

For many people "time-binding" means clinging tenaciously to time-honored traditions and beliefs. But the Renaissance thinker Pico della Mirandola (1463-94) affirmed a more future-oriented view when he wrote:

> *"I have given you, Adam"--so says God--"neither a predetermined place, nor a particular aspect, nor special prerogatives, so that you may take and keep that place, that aspect, these prerogatives that you may desire by your own choice and advice. The limitations in the nature of other beings are contained within my prescribed laws. You shall determine your own nature, without being constrained by any barrier, by means of your own freedom to whose power I have entrusted you. I have placed you in the midst of the world so that from there you might better see what is in the world. I have made you neither heavenly nor earthly, neither mortal nor immortal in order that, like a free and sovereign artificer, you may mold and sculp yourself into that form you will have chosen for yourself."*

Bursting with vitality and confidence, renaissance and post-renaissance thinkers were in no mood to be crushed by antiquity. Certainly, they meant to absorb it, to equal it, learn from it. But why? So they could produce their own race of giants and heroes.

This heritage of Renaissance confidence in the human ability to trans-create a usable past into useful present and a hopeful future should characterize Liberal Education.

FORTHCOMING IN HUMANITIES EDUCATION

FALL SPECIAL ISSUE ON "EXPRESSIONS OF THE SELF"

will include a set of color slides of self-protraits by
Francisco Goya
Larry Rivers
Robert Rauschenberg
Escobar Marisol

with notes by Tad Park.

Also essays on an "Expressions of the Self" course and a course that uses computers to generate self-expressive concrete poetry.

Plus abstracts and reviews of articles and books about self-portraiture, autobiography and personal narrative.

. . . AND FOR WINTER 1989,

Articles on:
Teaching Genesis and Exodus
An interdisciplinary course on landscape
Two articles on courses that help students to Experience the Arts

Don't let your subscription lapse!

Check your address label: if it says ***SU88,*** this is your last issue of ***HUMANITIES EDUCATION*** (A membership subscription form is at the end of this issue, following *HumaNews!*)

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

NARCOTIC FLICKS

"Cinema and the Sacrifice of Narcissus" by Jean Collet in **Cross Currents** XXXVII:2-3 (Summer/Fall 1987). Convergence Inc., 103 Van Houten Fields, West Nyack NY 10994. $12.50/yr.

Like other theaters and stadiums, the cinema is a sacred place, different from the humdrum complications of everyday life. In the windowless darkness, the spectators lose their varied individuality and cease to interact. As in the older church liturgies and the picture-frame stage, spectators are separated from the performance, but unlike modern liturgy and stage, there is no way for cinema to reduce the barriers.

In addition to being a sacred space, cinema shares the sacred characteristic of being a place where events unfold in a ritual way. But in cinema, the ritual is mechanical. Each film is unvarying in performance, and the creators and performers are not even present. "The distance which separates the spectators from the artisans of the film is immense," says Collet, a French film critic, "making movie actors and directors the gods of the modern world," for the spectators are enthralled with the "mystery of origins." The creators, being so inaccessible, become mythologized.

The sacred also is defined as the "wholly other," ultimately the difference between life and death. But here too cinema is unique. Actors do not die; in film they are always alive, always of one age. Films even abolish the frontier between the animate and the inanimate as we confuse illuminated shadows on a flat screen with real, substantial landscapes, persons and happenings. "What happens when there no longer are differences, when we can no longer distinguish sharply between the real and the imaginary, life and death, I and the other? We lose our identity."

This is the concern of the best films and directors, Collet claims, for consciously or unconsciously they wrestle with the problems of these differences and the cinematic subversion of them. The myth of Narcissus is useful here. When Narcissus encounters his reflected image, he sees his double, not himself, and he is terrified, not enamored, becoming rooted to the spot out of fear. **Narcissus** is of the same language root as **narcotic**; the myth is one of passive violence, self-destruction by way of torpor. The death of Narcissus is a kind of sacrifice resolving "the mimetic crisis," and celebrating the birth of the imaginary. The reflection is not Narcissus, but something different--an image. In respect to film Collet proposes what he calls "the Narkos effect...which is the destruction of differences, the identity crisis, mimetic and narcotic violence."

There seem to be four ways of confronting the Narkos effect, according to Collet. There is **cinema of illusion**, which tries to mirror what we believe to be alive and real, "true-to-life convincingness at any cost." **Cinema-mirror**: the screen is a mirror, but the film lets us know that it is a mirror, often with the use of actual mirrors and reflections. **Cinema and the sacrificial crisis**, where the "great directors" deal in content with the double, the alter-ego, the fascination of Narcissus, and the necessity of destruction of the negative force. **Passage through sacrificial violence**, by which Collet means the rare films in which what is destroyed is not the double or the reflection, but illusion itself. Narkos is seen for what it is, and the moviegoer is set free.

P.D.Q.

"On Interpreting Music in an Historical Framework" by J. Robert Burkholder in **Soundings** LXX:1-2 (Spring/Summer 1987). 309 Alumni Hall, University of Tennessee, Knoxville, TN 37996-0530. $15/yr.

Music. The universal language, say naive globalists. But what meanings does music convey? It can convey messages as in the case of a bugler sounding reveille or a fanfare announcing a beginning or an arrival. Such ritual examples are soon exhausted and hardly would justify the sweeping analogy of music to language. We should also disallow songs, for their primary medium of communication is verbal language. And except for echoic sounds such as cuckoo-calls, music seems incapable of unambiguous denotative meanings.

At times people have caved in to such objections and shifted the analogy away from language. In the middle ages and for some modernists, music is analogous to mathematics. Some nineteenth-century musicians thought of music as analogous to biology--the "seed" of a musical idea grew, flourished and blossomed. Twentieth-century composers like Edgard Varese speak in spatial terms rather than linguistic terms: music is "bodies of intelligent sounds moving freely in space." None of these structural analogies, though, can explain why the analogy with language persists and dominates.

There are three valid aspects of the comparison, says Burkholder, who is at the University of Wisconsin. First, structurally music is like language. Like speech, it is sounded and understood over time, and it relies upon syntax, the ordering of smaller elements according to conventional rules. It even shares rhetorical terminology--phrase, introduction, transition, conclusion, for instance. Another valid comparison is that although music "has no names for objects and ideas...it can refer to non-musical things through musical metaphors" such as echoic sounds and metaphors for gestures, emotions and visual characteristics. Music can convey grace, impudence, nobility, glitter and gloom.

Finally, music, like language can be "self-referential." This is Burkholder's main topic, and interested readers will want to examine his careful interpretations of Mozart's overture to **The Magic Flute**, Mahler's **Fourth Symphony** and Richard Strauss' **Four Last Songs**, in each of which he demonstrates that the music is making profound statements about the condition of the world. Strauss' **Songs**, written in 1948 a year prior to the composer's death, deny all the changes made in musical expression of the previous three or four decades--resolutely tonal and Romantic, they affirm a peace after the storm. Quoting his own **Death and Transfiguration**--written sixty years before--"I know this Death, Strauss seems to say; He is an old friend."

Thus, when music is self-referential, making use of prior musical styles and idioms (which is to say historical sources) it can, like language, express comparative, analytical, critical and synthetic ideas of great complexity. P.D.Q. Bach does it all the time.

HISTORY BOOM OR BUST

"Organizing America's History Business: A New Ethic and Plan of Action" by Larry E. Tise. Technical Information Service, American Association for State and Local History, 172 Second Ave. N., Nashville, TN 37201.

It simply doesn't make sense. Everyone knows of the historical amnesia of American students, but history is Big Business in America. Over 5000 historical organizations have come into being during the past score of years. Genealogical research in archives is a national hobby. Historic preservation of commercial, public and residential buildings is transforming our cities and neighborhoods. Most Americans list visiting of historical sites and museums as their prime interest in traveling.

The problem must be in the schools. Let's ask where the trouble lies. The high school history teacher says "I can't teach real history; it's all watered down in social studies." Ask the teacher's supervisor: "Our teachers aren't properly prepared." Ask the education professor: "Process is what we teach, not content." Ask the university department chair: "History isn't (but should be) required K-Ph.D."

Ask the students: "It's boring."

What is it that is boring- - history itself, the people, places, things, events, or is it the way in which history is presented in classrooms, lecture halls and textbooks? It must be the latter, for history outside the academy is Big Business. But there are other problems, notably with academic historians themselves, according to Tise, who is Director of the American Association for State and Local History. Far too often academic historians have not deigned to recognize the legitimacy of the interests, wants and expertise of those in the groundswell of historical business. Partly this was an accident of recent history: just when we most needed professional guidance in new fields of public history, industrial archaeology, minority history, material culture, museum studies, there was a decline in hiring of historians in colleges and universities, and this has dramatically reduced the number of students graduating with degrees in history.

But partly it is neglect, both wilful and benign. Tise organized annual academic history conferences in North Carolina and Pennsylvania to discuss new developments in history, but the discussions tended to reduce to lamentations about how to get history made an undergraduate requirement. And rarely will an academic historian participate in the planning and development of museum exhibits and site interpretations.

The new ethic Tise proposes is to recognize all who practice history professionally as "practicing historians." That means preservation architects, museum curators, librarians, archivists and history teachers as well as academic historians. And we should also recognize as historians the "amateur historians" who do not have the professional credentials of graduate degrees, but who have achieved expert knowledge in areas such as local history, specialized collections, history of an industry, etc. With that new recognition and mutual respect, historians can forge ahead in a four part plan of action: search for a common ground by way of conferences, develop a more comprehensive resource network integrating all fields of history, foster collaboration among history groups and institutions, and bring all historians into the business of popularizing history.

FROM DEMYTH TO REMYTH

"The Case for the History of Religions" by Wendy Doniges O'Flaherty in **Daedalus** Spring 1988. P.O. Box 515 Canton, MA 02021. $5/issue.

To be "mythologized" is to be committed to a religion. Conversely, to be "demythologized" is to be disaffected with myths and religion in general. These terms must be understood if we are to understand O'Flaherty's response to this issue of **Daedulus** which is the transcript of a conference on "Religion and Education." Her questions are: who are the students for education in religion? Where are they? What is the status of their religious commitment and knowledge of religion?

The educational settings vary from seminaries, where it is reasonable to assume students are thoroughly mythologized, to church-related high schools and colleges, to secular universities where the students will run the gamut of unmythologized, unde-, de- and re-mythologized, which we might translate into the irreligious, the old-fashioned devout, the secular humanists, and the people who reject secular humanism, are unable to return to traditional devotion but recognize the need for something beyond rationalism--"They have eaten their way through Marx and Freud and are still hungry."

The educators in the conference, she says, focussed on the teaching of their own religions. Given the wide variety of students whose religious knowledge may be nil and whose commitment may be blind faith or equally blind opposition to all religious instruction, it is reasonable to envision classrooms of not very receptive students for thoughtful and tolerant yet critical learning. And yet there is a hunger for myth which manifests itself in many ways among students "who are increasingly ignorant of their own religious traditions yet still susceptible to religious impulses." For these, soap operas, comic book god-heroes, science fiction and other "false mythologies" coupled with quasi-ritual communities of "computer covens," Trekkies, and therapeutic fads of body and soul keep them just clear of solipsism and despair.

So here is the case for History of Religions: "the otherness of other people's religions...enables us to do a kind of end run around some of the obstacles that stand in the way of our understanding of our own religions." O'Flaherty, who Mircea Eliade Professor of the History of Religions at Chicago, concludes that ideas that some would find intolerable in Jewish or Christian texts may be acceptable from other people, and ultimately, may help the students to reflect the ideas back upon themselves and upon our society.

992

THE RETURN OF LITTLE RED

"One-room Schools in America: Going, Going, Staying," by Ivan Muse and Raymond Moore in **Small Town** (January-February 1988) Small Towns Institute, 3rd & Poplar, Ellensburg WA 98926. $30/yr.

One-room schools at their best were models of truly integrated interdisciplinary education. At their worst, they were cesspools of incompetence and neglect. Yet, we should recall that until the 1840s, one-room schools were all we had. Slowly, grading schools into separated age-groups made inroads in cities and towns, and in the twentieth century, consolidation of districts accelerated until now there are only one-eighth as many districts as in 1930. The number of elementary schools has also been reduced to one-fourth asmany. But the number of one-room schools is only two-thirds of 1%. There were, in 1984, only 837 left.

There were well over 200,000 before World War I.

The trend toward extinction has not turned, but it seems to have stabilized, according to Muse and Moore of the Principal Training Program at Brigham Young University. Moreover, the image has changed. Teachers are no longer the dregs of the profession, but most are well-educated, enthusiastic women and men who chose small schools and rural life. Pay "is in line with living costs." Pupils benefit from peer tutoring and individualized instruction. The average school has about ten pupils. Most of the buildings have been renovated with natural gas heating and inside restrooms. Computers, television, frequent field trips and ample supplies are common. And the students perform as well or better than their town counter parts. The schools have changed, but oddly enough, their most "modern" characteristics are the legacy of the past that may point the way for correcting the faults wrought by our other legacies of specialization, bigness, and impersonality.

SOUND KNOWLEDGE

"Music of the Maya" by Paul F. Healy in **Archaeology** January/February 1988. Box 928, Farmingdale NY 11737. $20/yr.

The sounds of remote cultures of the past are at least as elusive as the tastes of the past. If only we could bring them back we might be able to connect the students munching the cold pizzas, their heads clamped in Walkmen, with history. Some aspects of music of the Maya of 600-900 AD has been recovered from an aristocratic burial site in Belize in 1986 by Healy, who heads the Anthropology Department at Trent University in Ontario.

Mayan murals and writings as well as early Spanish accounts tell of flutes, whistles, conch horns, drums and maracas rattles in military and ritual processions. The recent excavation yield a variety of multi-stopped ocarinas. Some are in the shapes of figurines--the male figurines pitched to a lower register than the female. Also uncovered were composite instruments, flute-maracas which could be blown or rattled. Ceramic drums were also found, but no drumheads, which like wooden trumpets and reed flutes, could not survive the tropical climate.

How did it sound? Mournful, Healy says. The instruments were probably played in the funeral procession, then ritually broken and placed in the graves. But what were the rhythms and melodies? We don't know.

Heard melodies may be sweet, but those unheard are exasperating.

GENERAL VS. LIBERAL

The Meaning of General Education by Gary E. Miller (Columbia University, Teachers College Press, 1983) Review and commentary by Sharon Scholl.

Aside from the relatively small number of interdisciplinary Humanities major programs in American universities, the vast majority of Humanities offerings exist to provide non-specialized educational experiences for an unselected cross-section of students in educational institutions at all levels. Gary Miller's book is about this rootage which we share with Western Civilization, general biology, and a host of other broadly based studies. The major assertion of his writing is that General Education and Liberal Education are two quite different things with rather different parentage and expectations. One infers that Humanities instruction should take on notably different coloration depending upon which of these root systems it is attached to. Thus this review will attempt to do justice to Miller's assertions and their substantiations while applying their content to the case of Humanities.

There has always been a strain between the ideals of providing an educated leadership for our society and offering a student-oriented, utilitarian curriculum. This larger issue spawns many smaller ones, such as the prescribed curriculum versus the free elective type. The Yale Report of 1828 came down on the side of prescribing a course of studies to provide "discipline and furniture of the mind." It looked to the past for enduring truths to guide students in shaping the future. By 1870, under President Charles Eliot, Harvard went in the opposite direction. Here the individual was the key to progress in a democratic society. The student must be free to choose his own intellectual path and develop vocational specialization. The research ethos was heavily laid atop this foundation with the burgeoning of science at the turn of this century. With teachers functioning as consultants in social institutions, the concept of the school as an element of social utility became dominant. And so the ideological see-saw has moved between these points to the present day. Liberal Education is one dip of the board, and General Education the opposite.

An important contributing collection of ideas is summarized by the term, "humanism." It contains a belief in the efficacy of human knowledge, the concept of progress, the reality of the human spirit, the possibility of civilized life on a scientific basis, and an appreciation for beauty. Out of this bedrock grew the Great Books curriculum (a Liberal Education paradigm) developed by Hutchins in the 1930's. The Contemporary Civilization program begun at Columbia University in 1919 (a General Education paradigm) used this humanistic credo to apply knowledge to current problems, helping students to make more informed judgments. The development of values, modes of action, rather than for knowledge **per se**, and use of the Western culture heritage for practical, current ends, is the hallmark of the General Education approach. Not to be outdone, Alexander Meiklejohn founded the Experimental College at the University of Wisconsin in an updated version of the Liberal Education approach. Unlike adherents to the General Education ideal, he saw the form of education as separate from the content or subject matter. The task of education was, in his view, the making of minds, especially a national mind of social values and predispositions which would create a distinctively American culture (shades of Hirsch's **Cultural Literacy**!). The curriculum was to cultivate intelligence, which could then be applied to any field whatsoever, thus avoiding reliance upon discipline-based systems of knowledge. His curriculum, spread over the freshman and sophomore years, centered about Athens in the fifth century B.C. and nineteenth century America.

Robert Maynard Hutchins' **The Higher Learning in America**, written in a time of social turmoil (1936), indicted the anti- intellectual university created by rampant vocationalism, over exposure to socio-political pressures, and over-emphasis upon pragmatic results. In a diagnosis prophetic of our current situation, Hutchins blamed this complex pressure system for the low state of literature and the arts. His prescription was also the one heard most today: strengthen the Liberal Education component of the curriculum.

While Hutchins' remedy was taken up by some segments of the educational establishment, the instrumentalist approach to General Education was flourishing in other institutions. In an ample chapter, Miller traces the history of General Education back through the pragmatism of John Childs, Charles Sanders Peirce, William James, and John Dewey as it ripened into an educational force in the individualistic, psychology-minded era of the 1920's. It is recognizable for its link between democratic aims and democratic classroom styles and its insistence upon individualism and the transformation of society through self-realization. The Bennington College experiment with students participating in community projects and faculty organized into learning communities as "general practitioners" was a direct application of this stream of thought. Far from rejecting socio-political pressures upon the curriculum, as did Hutchins, the faculty at Sarah Lawrence were dedicated to adapting the curriculum to a changing student body and to the emerging needs of society. General Education is notable for its focus upon our specific democratic society at our time and place, drawing from the past only that which will illuminate the path ahead. Knowledge is not an end in itself, but a tool shaped to the individual by direct experience. It is not preparation for a vocation or more specialized academic study, but is in itself the process of living as an educated citizen. Miller cites the Community College movement and its attendant philosophical rationale as one application of this General Education paradigm. Social reconstructionist ideas about the aims of General Education were particularly strong during the 1940's and 1950's, modified to some extent by the Liberal Education insistence on common standards rather than personal value dominance, and on social responsibilities rather than personal proclitities for reshaping society.

The baby boom and the social upheaval of the next two decades brought the fragmentation of curriculum and increasing diversity which has worked against both Liberal Education and General Education. Voices from the President's Commission on Higher Education (Henderson & Henderson, 1974) were raised against this trend, citing now familiar objectives for General Education: retrieving a unity of knowledge, development of critical thinking skills, providing historical perspective, linking education to life fulfillment, creating social conscience and an ethical basis for decision making. Interdisciplinary studies served as one model for achieving such goals. The advent of huge populations of adult students living "blended" lifestyles with education a necessary component, along with relentless technological change have led educational institutions to emphasize once more the General Education philosophy today.

Where are the interdisciplinary Humanities in all of this? It seems to me we have a stake in both camps, but not to the same degree. Perusal of university catalogues describing Humanities courses reveals a dominance of the Liberal Education model centered upon Western culture-history. We really use a grandly expanded Great Books model, attempting as we go to apply the literary situations and visual/aural formulae to current manifestations of those same items. We try to identify enduring streams of concurrent ideas that span time in recognizable transformations, to alert students to the coherence of the human enterprise over vast reaches of time. We are also interested in the diversity of solution to enduring problems offered by varied approaches, along with the advantages and disadvantages of each. Much of this instructional model seems to be devoted to the Liberal Education ideal of responsible citizenship, providing a new generation who will carry on the symphony societies and art museums of the future. We are in the business of creating the readers of important literary works to come, supporters of local educational television, and, in short, people who live at a level beyond that of easy commercial superficiality.

To a lesser extent we operate out of a General Education model, largely exemplified by thematic courses based upon experiences students most probably have had. Technology and Values is the most popular of these designs, followed by a blizzard of other issues such as the environment, death and dying, male-female confrontations, and regional themes. These offerings are dependent upon the nature of the educational institution and the position of such issues in the student consciousness. They tend to flit in and out of the catalogue with the changing intellectual and social climate, giving rise to the complaint that Humanities can be "trendy" and superficial.

The Meaning of General Education points out the temperamental difference between those of us who think of Humanities (and education in general) as a process of acculturation and those who prefer self-realization as the model. Should Humanities teach us to value the great works of the past, to seek the company of significant thinkers, to cherish and preserve what we term our heritage? Or should Humanities teach us how to activate our society in new directions using the habits of mind developed from studying no particular canon, but a wide range of expressions of the Western (and presumably other cultural) experience? It seems to me there is no "solution" to this issue, and perhaps both are necessary. I doubt they can be accommodated in the same course; my own experience indicates that trying to include both in the same curriculum can skew enrollment patterns strangely. If Gary Miller is right in his assertion that Liberal Education and General Education are distinctly different models, then the fact that we have this dual rootage may be one part of our difficulty in defining ourselves and our roles in the educational establishment.

996

LIFE-LONG HUMANITIES

The Humanities and the American Promise; a Report on the Colloquium on the Humanities and the American People. Reviewed by Sharon Scholl.

You're kidding; not another one! Yes, friends, yet again a report on the status and prospects for the Humanities is loosed upon us. However, this time the source is a less familiar one. The colloquium of scholars, writers, and educators from which the report issued was a year long affair funded by the Division of State Programs of the National Endowment for the Humanities. Their interest is adult education in the Humanities, much of which takes place outside the direct supervision of educational institutions. The report "seeks to explore the relationship between the Humanities and American public life."

Rejecting the disciplinary definition of Humanities familiar from NEH enabling legislation, colloquium participants offer instead a few general observations about the nature of all Humanities endeavors:

> *The humanities have both a personal and a civic dimension, enriching individual life and making possible a shared reflection, a reasoned civic discourse.*
>
> *The Humanities take the long perspective, dealing with timeless questions continually redefined but never fully answered.*
>
> *The Humanities strive toward synthesis despite overwhelming tendencies to disciplinary fragmentation and over-specialization.*
>
> *The Humanities often disturb the status quo, asking troubling questions, encouraging critical analysis.*
>
> *The Humanities assume a moral dimension without claiming to make people humane by mere contact. Nevertheless, they give a sympathetic account of varied cultures and value systems, engendering tolerance and healthy skepticism about absolute claims.*
>
> *The Humanities deal with means as well as ends and develop the habit of critical intelligence.*

All the foregoing (and this is the whole point of the report) are absolutely essential to citizen-directed cultural processes inherent in a democracy. "The values of openness and diversity, of individualism and democracy, of pragmatism and progressivism that are associated with historical American institutions have imbued American thought and expression, so much so that a public curriculum in the works of American writers, historians, philosophers, and artists is virtually and imperative of citizenship." Oddly enough, some legitimate uses of the Humanities mitigate against others. For example, while sympathizing with E. D. Hirsch's call for a universal "cultural literacy" based upon shared intellectual foundations, the colloquium reminds us that it moves against the grain of an open, diverse society.

What cultural products are worth incorporating into the body of intellectual capital generally recognized as the Humanities? The colloquium is hesitant on this point, agreeing that all the new media technology can be well adapted to Humanities purposes. However, they caution that the purpose of Humanities is to heighten and sharpen consciousness; the tendency of most popular culture is to deaden it, providing comfortable, uncritical and unmemorable experiences.

Why do the Humanities find such hard going in American culture? With all its supposed openness and diversity, American society has always been plagued with an ugly tendency toward anti-intellectualism. The Humanities run counter to the activist, utilitarian, pragmatic mainstream of American culture and have never been self-justifying to the American people. They have always been justified on some instrumental ground which has the healthy effect of keeping them from becoming a hothouse plant in the ivory tower, but the unhealthy prospect of being a "devalued, trivialized, marginalized" aspect of the modern industrialized state.

What is the role of educational institutions vis-a-vis the Humanities? Partly, the colloquium admits, they have a role as conservators of tradition, but also they should be hotbeds of innovation, insisting on new ways of thinking. Responsiveness to important social currents should form at least some teaching and learning. Humanities within educational institutions are pulled by three different tendencies: to adopt a quasi-scientific methodology, to preserve a hallowed (and threatened) tradition, and to become one cog in the wheel of career development. In the face of such conflicts, the report asserts that educators can only claim that "they help individual human beings toward the fully developed consciousness necessary for reflective life."

What lies ahead; where should the Humanities now be moving? With this question we uncover the hidden agenda of the colloquium, to generate enthusiasm for adult education in the Humanities. They place the fundamental impulse from which all the materials collectively designated "the Humanities" spring in the universal human attempt to find meaning in life and deal seriously with human conduct in all its variety. The group charges educators with the task of doing their part to bridge the gap between the Humanities and the general public via state based public programming. Adult education should not stand apart from schools' primary mission; Humanities should not be dispensed "out the back door" to adults. Because literary clubs, Chautauquas, and other non-school agencies of intellectual culture have declined precipitously, schools must take up the slack. In a manner of speaking, education in the Humanities is misplaced upon the young; it is only in maturity that the richest works in literature, philosophy, and the arts are required and available to most people. Humanities cannot be done, once and for all, in school. Humanities programs for adults should be as significant a part of the school agenda as instruction for young people. "The pressures of demographic and technological change and the imperative of an educated citizenry require that higher education face up to the demands for lifelong learning."

(Copies of this report may be obtained for $2.00 from the Texas Committee for the Humanities, 1604 Nueces, Austin, TX 78701.)

1989 NAHE CONFERENCE

Proposals for papers, panels, workshops, presentations, and other activities are now being accepted for the 1989 NAHE Conference in Kansas City, Missouri, April 20-22. The theme is "Teaching the Humanities." Send inquiries and proposals to James Mehl, Program Director, Department of Humanities, Missouri Western State College, St. Joseph, MO 64507. **Deadline: September 1, 1989.**

NAHE MEMBERSHIP

Why not share membership information with your colleagues in your college or university, elementary or secondary school, state humanities council, historical society or museum? Many of them are looking for just such an organization as NAHE. Copy the NAHE application form and pass it on to them.

NAHE MEMBERSHIP APPLICATION

Your name ______________________________

Your address ______________________________

____

____

Checks for $16 should be payable to **NAHE**

Prepaid individual membership and institutional subscriptions are $16/year. (If you require invoicing or special billing, the rate is $20.) Your payment will be acknowledged, notifying you when to expect your first issue of **HUMANITIES EDUCATION**. We are able to maintain the low $16 membership by printing only as many copies as there are paid memberships, so it is important to join now! Mail this form and your check to:

HUMANITIES EDUCATION
c/o Dept. of Philosophy/Humanities
University of Minnesota, Duluth
Duluth, MN 55812-2496

INSTITUTES, WORKSHOPS, PAPERS, ETC.

Paper Deadlines:

July 31
Theme: "Coherence in Liberal Arts Curriculum." Conference: October, Denton, TX. Contact Gus Seligman, Department of History, Univ. of North Texas, Box 13735, Denton, TX 76203-3735.

July 31
Theme: "Philosophy and Natural Science." November, Rochester, NY. Contact John Sanders, Philosophy Committee, Rochester Institute of Technology, Rochester, NY 14623.

August 1
Theme: "Literature and Science." Symposium, West Germany, August 1989. Contact Ellen Messer-Davidow, Department of English, 207 Lind Hall, University of Minnesota, Minneapolis 55455.

August 15
Theme: "Women and Peace." Conference: Urbana, Ill., March. Contact Jolie Fansen, Conference Planning Committee, School of Social Work. University of Illinois, 1207 W. Oregon, Urbana, IL 61801.

September
The 1989 Popular Culture Association/American Culture Association Meeting will be in St. Louis, Missouri on March 22-27. Calls for papers include the following: Politics and Literature - on any aspect of American politics and literature. Send one page proposals **by September 15, 1988 to Adam J. Sorkin, ACA Area Chair, Literature and Politics, Penn State-Delaware County Campus. Media, PA, 19063.** Cemeteries and Gravemarkers **- on any appropriate disciplinary perspective. Send 250-word abstract by** September **1, 1988 to Richard E. Meyer, English Department, Western Oregon State College, Monmouth, Oregon 97361; (503/838-1220), Ext. 362.** Theories of American Culture(s) will **have two special sub-topics: "How Do You Defend or Give Evidence for Assertions about 'American Culture' or 'American (Sub) Cultures'" and "The Role of 'isms' in the Examination of American Culture."** One-page proposals are required, as are finished papers for those proposals that are selected, but thirty-minute presentations should be planned for maximum audience participation. Send abstracts by **September 1, 1988** to Robert Evans and Fred Schroeder, Institute for Interdisciplinary Studies, ABAH 405, University of Minnesota, Duluth, 10 University Drive, Duluth, MN 55812. There are many other areas open. Write to Ms. Pat Browne, Popular Culture, Bowling Green State U, Bowling Green, OH 43403 for general information.

The South Central Modern Language Association will include a special session on Interdisciplinary Studies in the Humanities at its October 21-23 convention in Arlington, Texas. Chairperson is Keith Odom, Department of English, Texas Christian University, Fort Worth.

The Seventh Annual Meeting of the Group for Research into the Institutionalization and Professionalization of Literary Studies (GRIP) will focus on "Disciplinarity: Formations, Rhetorics, Histories." The meeting will be on April 20-23, 1989. Inquiries are welcome. Papers must be submitted by **October 15, 1988** to David Shumway, Department of English, Carnegie-Mellon University, Pittsburgh, PA 15213 (412/268-2850).

NAHE is jointly sponsoring with the Association for Integrative Studies a conference at Arlington, Texas on October 20-23. The specific part of the program by NAHE is a panel on "The Museum and Interdisciplinary Humanities Education," featuring Michael Jaye of the Wordsworth Project, Teresa LaMaster of the Field Museum of Natural History, Barbara Bartosik of Notre Dame's Snite Museum and Tad Park of the Minneapolis Institute of Arts. Other session titles include such things as "Interdisciplinarity and Literature," "Music: Image and Representation," "Science and Literature," "Interdisciplinary and Performance" and many others. For registration information, write Dr. David Jacobs, Associate Dean, CLA, U. of Texas Arlington, P.O. Box 19617, Arlington, TX 76019.

"Liberal Education in the Age of the Computer" is the problematic topic of the Eighth Annual Convocation of the Meiklejohn Education Foundation, Co-Sponsored and Hosted by the Integrated Liberal Studies Program, University of Wisconsin, Madison, October 22-26. A keynote speaker will help define the issue and set the problem. A panel of well-informed individuals representing a variety of viewpoints will work with conferees to develop possible directions liberal education might take in order to counteract those uses of the computer which are inappropriate or dangerous. The real work of the convocation will be performed by seminars composed of Experimental College alumni, high school and college students, university faculty and other interested adults. Each group will draw up its recommendations and submit them to an editorial committee which will, in turn, write a report. **Registration Deadline - September 15, 1988. For information call (707) 938-8314.**

The University of California Humanities Research Institute provides a continuing series of conferences and seminars addressing themes at the forefront of current dialogue in the humanities. Research themes are developed from major areas of humanistic concern:

Area Studies (western, eastern, third world, dominant and minority cultures), **Historical Studies** (retrieval of texts and contexts in major periods), **Discourse Studies** (the languages of the arts, humanities, and the sciences), **Humanities Beyond Its Boundaries** (Humanistic concerns in medicine, law, business, science, etc.) Future conferences now being planned include Biomedical Ethics, Legal History (UCSD), Cultural Interactions: Japan and the U.S., and Women and the French Revolution (UCLA). Nominations and applications will be accepted anytime. As the primary focus of the institute is on collaborative research, the initial response to proposals usually will be to conduct a conference on the proposed topic ont he campus of the proposing faculty or at the Institute. For information write or call University of California, Humanities Research Institute, 307 Administration, Irvine, CA 92717 (714/856-8180).

Journals: Vietnam Generation. A new journal devoted to the study of the Vietnam War and its effects on American society, culture, and politics, welcoming submissions for its first four issues from scholars in any field and encouraging an interdisciplinary approach. **Fall 1988** - America in Vietnam: the Process of Historical Revision; **Winter 1989:** A White Man's War: Race Issues and Vietnam; **Spring 1989:** Teaching the War: Interdisciplinary Approach; **Summer 1989:** Personal-Political: Women in Radical Political Groups, 1960 to the Present. Send submissions and correspondence to Kali Tal, **Vietnam Generation**, American Studies Department, Yale University, 320 York St., New Haven, CT 06511; (203) 865-8497.

Theory, Culture, and Society, Special Issue on Postmodernism. Contents include "Is there a postmodern Sociology," "Postmodernist Aestheticism: A New Moral Philosophy?" "The Post Modern Debate over Urban Form," "Beyond Progress: The Museum and Montage," and "Post-Modern Politics." Published by Department of Administrative and Social Studies, Leeside Polytechnic, UK. Send $15 + $1.50 postage to SAGE Publication, Ltd., P.O. Box 5096, Newberry Park, CA 91359.

New Major in Interdisciplinary Humanities. NAHE member **Michael F. Wagner** has been appointed coordinator of the new major at the University of San Diego. Instituted in 1988, the Interdisciplinary Humanities Major is a full major. It is not, for example, just a certification program to supplement a student's "real" major. This major is **interdisciplinary** because it requires that students take courses from several different humanities disciplines and it places special emphasis on interrelationships among these disciplines. The humanities disciplines are: art, English, foreign languages, history, music, philosophy, and religious studies." For a brochure, write to Mike Wagner, c/o Dept. of Philosophy, University of San Diego, San Diego, CA 92110.

CALL FOR PAPERS

National Association For Humanities Education National Conference

April 20-22, 1989
Kansas City, Missouri

Conference Theme

"Teaching the Humanities"

Proposals are invited for papers, panels and discussion workshops which contribute to the teaching of the humanities in an interdisciplinary way.

Send one-page abstract by September 1, 1988 to:

DR. JAMES V. MEHL, HUMANITIES
MISSOURI WESTERN STATE COLLEGE
4525 DOWNS DRIVE
ST. JOSEPH, MO 64507

Missouri Western State College is an equal employment and educational opportunity institution.

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity**, **humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

Expressions of the Self

A Special Issue of Humanities Education

This special issue is dedicated to ideas about teaching creative self-presentation. The initial impetus for this issue was actually a selfish one. I had been teaching an humanities course on self-presentation (described later in this issue) and was anxious to find out what others were doing in similar courses or with similar materials. Fred suggested that readers of HE might be interested in knowing about my course and that the topic was a perfect one for sharing slides of self-portraits with subscribers. We are pleased with the results of our call for papers and hope that each of you will find something in this issue to enhance your teaching of expressions of self.

I, myself, have been inspired by ideas in each of the papers. Tad Park's introduction to and discussion of the slides of self-portraits (included in your mailing) from the Minneapolis Institute of Arts is filled with valuable information about the artists and about their expressions of self. I can imagine being able to teach a whole class, maybe two, maybe more, with those slides and the information Park has provided. Bernard Brenner's paper describes and analyzes the self-portrait assignments in his course devoted to the study of the computer as a creative visual tool. His assignments are intriguing, and the results, reproduced throughout this issue, were exciting. His paper makes me want to order Macintoshes for all of my students tomorrow!

Margaret Boegeman's description of assignments in a standard survey course shows how students can be challenged by work that engages them in creative expression and self-analysis. Their expressions of self help them to understand that our cultural heritage is a product of people like themselves. I'm ready to advocate for similar assignments in our core curriculum.

Finally, our reviews and abstracts in this issue are also related to the theme of self-presentation and will give you, I think, other good ideas for your teaching. I hope you are pleased with this issue.

Four Self-Portraits from the Minneapolis Institute of Arts

Name any artist. You can almost bet that he or she has made a self-portrait at one time or another. Simply by looking in the mirror there is one model who is always available--no payments for long sittings, no transporting of equipment to distant locales, no concern with another's ego or insecurities. If you want to practice a new technique, to study the structure of an eye or an ear, to record a smile or a scowl, you can always study your own face.

An artist creates from personal experience, familiar situations, to solve problems or gain insight. A self-portrait can be the result of any of these endeavors. It can take any shape from a simple drawing to an elaborate painting, from an exact likeness to an image of who the artist would like to be. It can be the product of inner necessity or public pressure. Each is equally an expression of self, in relation to the artist as the autobiography is to the writer.

The four works discussed here represent the broad range of response possible within the category of self-portrait, from the highly introspective work of Goya to the social criticism of Marisol and the relatively detailed collaboration of artist with materials of Rauschenberg. Yet there are many connections to be made between these pieces. Stylistically, all were attempts at a greater freedom of self-expression than was the contemporary norm. Each breaks some existing taboo or presents a fresh expression of artistic identity. Yet all four works make use of traditional idioms--the religious icon, the studio setting, the genre scene, the artist's attributes--to create these original personal statements.

In terms of content, all four works explore the issue of identity as self-definition, questioning or asserting the artist's place in society and history as well as his or her position vis-a-vis contemporary values. Each presents its viewpoint in a direct "take it or leave it" manner. This is the way it is, they say--or the way it was. This is what I felt, what I saw, who I was, who I am. You cannot question my reality.

On a more individual note, both the Goya and the Marisol directly involve the viewer with the artist's inner thoughts and emotions. He does so by confronting the viewer with haunting imagery that demands response and interpretation, she through the actual physical inclusion of the viewer within the spatial framework of the sculpture. Rivers and Rauschenberg present less emotional if no less personal portrayals. They reference instead their creative development and the process of artistic maturity.

Finally, all four works incorporate multiple imagery, introducing a time element or attempting to portray the subject from all angles. With each work a moment (or moments) in time is frozen, extracted, memorialized, made larger-than-life, timeless. Context is reinforced as is a concern with telling the whole story, even though each image is only a selection from a larger continuum. In so doing the artists betray their self-awareness and the aspect of public consumption of these essentially private works.

But are they private? Can any self-portrait be, however enigmatic, a statement? Surely Goya intended his work as a public statement, the written legend that accompanies it attests to that. Similarly the scale of Marisol's sculpture, Rivers's painting and Rauschenberg's print mark these as public domain. How then do we understand the artist's intent? To what purpose are these expressions of self? It is hoped that the following materials will suggest some answers.

Francisco José de Goya y Lucientes
Spanish, 1746-1828
Self-portrait with Dr. Arrieta, 1820
Oil on canvas; 45 1/2 x 31 1/8

Goya was an extraordinary painter, but surely one of the most original works of his long and astonishing career must be the Self-Portrait with Dr. Eugenio Garcia Arrieta. The last of Goya's many self portraits, this unusual painting strikes one as being simultaneously very modern and almost archaically traditional in appearance.

Goya has represented himself in a gray dressing robe, his hands lying limp on the counterpane, his shoulders supported in an upright position by Dr. Arrieta, who sits behind him and silently persuades his patient to take a glassful of medicine which he holds in his right hand. The doctor's head is lighted from the left and solidly defined with vigorous passages of heavy impasto alternating with broad and delicate areas of pigment. The slumped figure of the moribund painter, however, is very thinly painted, allowing the grain of the canvas to become visible: Goya portrayed himself as on the point of disintegrating or disappearing before our very eyes. His pallid flesh tones are tinged with deathly gray tints. His unseeing eyes are raised behind the slack lids and his mouth falls limply open. Only two bright notes are struck in this chilling canvas: the verdant tones of Garcia Arrieta's coat (appropriately, green is the traditional color attribute of Hope, and the victory of life over death), and the contrasting red color of the blanket covering the legs of the dying painter. This symbolic mode of characterizing the quick and the dead is further reiterated by Goya's affecting treatment of the hands of the two protagonists: the doctor's are strong and protective whereas those of his nearly comatose patient are groping and uncertain.

At the extreme lower edge of the composition, the blanket ends abruptly and makes way for an ocher field on which the following words are inscribed: "Goya, in gratitude to his friend Arrieta: for the compassion and care with which he saved his life during the acute and dangerous illness he suffered toward the end of the year 1819 in his seventy-third year. He painted this in 1820." The intrusion of writing at the bottom of paintings is not unique in Goya's work. Several earlier portraits contain such captions at the bottom of the canvas. But in this case Goya clearly intended to evoke a familiar form of religious painting: The ex-voto, which was then, as it is now, enormously popular in Spain. The form of the ex-voto is almost always the same. The major scene generally narrates some catastrophe that befell the votary: an attack of fever, a bad accident, a dangerous brawl. At the bottom of these crudely colored, primitive images there generally appears a short statement about the nature of the mishap and a fervent attestation to the miraculous power of the saint to whom the image is dedicated. As in a notarized document, the name of the recipient of divine grace, as well as the date of his recovery, officially concludes the text. Goya transposes the concept into a secular idiom.

It is the miracle of Dr. Arrieta's profound humanity that averts the menace of death. And the catastrophe is not only to be thought of in terms of the sickness that has undermined Goya's strength.

At either side of the vigorously painted, chromatically rich group of the doctor and his patient there appear vague figures that seem to vanish into the blackness of the sickroom. Imprecisely painted in "unreal" phosphorescent earth colors and dark gray tones, they differ markedly from the concrete treatment of the very "real" figures of Garcia Arrieta and Goya. These dreamlike spectres are, however, stylistically as well as emotionally a close parallel to the obviously nightmarish and menacing figures that populate the visionary "Black Painting" of the same period. The glass of medicine Dr. Arrieta proffers combats the sickness, but his embrace, his courage put to flight the shadowy figures of the background and keep them from preying on the sick man. In a way, this painting not only is an ex-voto to a physical return to health but also depicts the resurrection of a spirit which has suffered under the onslaught of demonic obsessions. Goya has wrestled with the demon and has won because of his friend's steadfastness, loyalty, and devotion.

By picturing Dr. Arrieta as a ministering and consoling, counseling and inspiring figure, Goya draws on another religious tradition, that of the Ars Moriendi ("Art of Dying"). This popular illustrated treatise offered a thoroughly practical approach to the problem of "dying well," including a series of prayers and supplications dealing with the death-struggle and a detailed description of the "Last Four Acts." As in Goya's Self-Portrait with Dr. Arrieta, the drama always takes place in the dying man's bedroom and, moveover, according to the fixed pictorial formulas of the Ars Moriendi, demons and angels endlessly and rancorously dispute over the soul of the moribund man, inevitably depicted as lying powerless and supine in his rumpled sickbed and surrounded by the diabolic host. These diabolic temptations must be exorcised or thwarted--and the only way that they can be successfully thwarted is by the intercession of a person of this world who will volunteer to serve as a solicitous and devote spiritual guide. In Goya's self portrait the real man who voluntarily takes on the emotionally demanding role of the guardian angel is Dr. Arrieta.

Finally, the religious connotations of this painting go beyond even these obvious references, though Goya alters each in turn to suit his own nihilistic times. There is a strong allusion here to communion--a secular communion of friend to friend. In the first page of his The Disasters of War, we already saw that Goya figured himself in the guise of Christ in the garden of Gethsemane. Is it too much to interpret the subsequent Self-Portrait with Dr. Arrieta as the presentation of the cup of bitterness? Like Christ, Goya recoils from the cup, and like Christ, he is persuaded to take up his mission again and fulfill his destiny.

Larry Rivers
American, 1923-
The Studio, 1956
Oil on canvas; 82 1/2 x 193 1/2

Within the New York art world of the 1950s, Larry Rivers fashioned a new and potent artistic identity that mixed hedonism with disciplined craft, the existentialist self-reference of the Abstract Expressionist painters and a more lighthearted autobiographical obsession. Ingeniously, he made art of his own life, his friends, his family, and, perversely, even from a nostalgic dream of art history and lofty "tradition." His art, in fact, thrived magnificently on the very contradictions so conspicuously advertised by his life.

Too often, however, Rivers's theatrical verve threatened to distract serious attention from his very considerable artistic achievement. Both his successes and his failures were written off as either cynical or shallow. More insightful observers have realized that the major factor separating Rivers's achievements from those of most other artists is his willingness to publicize his struggles by presenting Life and Art as an integrated, multifaceted whole, with all components equally visible and subject to scrutiny. And as those most familiar with the man and his work have noted, the two aspects are inseparable.

In painting, Rivers's first and in many ways still most radical achievement was the historic Washington Crossing the Delaware (1953), a 20th-century effort, of mixed sincerity and ironic inspiration, to create an Academic Salon "machine." It was an impressionistic improvisation after Emmanuel Leutze's patriotic celebration in paint, which every American schoolchild knows by heart. In its own time, the painting was received as a visual polemic, a reaction Rivers encouraged by repeated statements disassociating himself from the reigning school of abstract art. No one then foresaw that Rivers's counterrevolution in style and subject matter might lead to the Pop Art of the sixties. What must have seemed an indulgent exercise in nostalgia was only later understood, more complexly and equivocally, to contain distinct elements of conscious irony and parody. The fact that Rivers refused to distinguish between "good" art and "bad," between the vulgarity of Leutze's Washington and the artistic refinement of a Géricault nude study, another source of his early work, was itself significant and anticipated the more democratic and matter-of-fact attitudes of a later generation. As the pendulum of art swung away from invention and the subjective idealism of the Abstract Expressionists, the "inspiring" and hierarchic subject gave way to popular sources in the search for new imagery.

Rivers continued to challenge contemporary taste with a series of justly acclaimed "allegories," climaxed by The Studio of 1956. The Studio was Rivers's most ambitious and considered venture since Washington Crossing the Delaware. A "realistic" allegory of his own life, it depicts a familiar personae of family and friends in multiple exposure, but their large scale and generalization of image elevate this private world to the level and intensity of myth. The work's spiritual forebearer is Gustave Courbet's quasi-philosophical manifesto The Painter's Studio (1955), which Rivers had seen in the Louvre. Unlike an earlier homage to Courbet, however, this canvas makes no visual reference to the master's composition (although it does include a self-portrait, the focal point of Courbet's studio scene). Rivers's panorama--the work is over sixteen feet long--is as light and airy as the Courbet is earthy and somber. It portrays not contemporaries and admirers paying homage to the artist's achievement but his circle of family and friends. Thus Rivers tempers his allusion by introducing a degree of whimsy and substituting more intimate personal references for the earlier work's self-conscious symbolism.

The Studio was painted in Fairfield Porter's Long Island studio, borrowed for the occasion, and the pot-bellied stove acknowledges the locale. Rivers's mother-in-law, Berdie, is seated at the far right in double exposure, the artist's son Joseph is positioned to the immediate right of a pot-bellied stove, and another son, Steven, is seen nude in three different positions. Frank O'Hara, the poet who had become Rivers's intimate friend and aesthetic apologist, stands farthest to the left, his foot on a scale.

Each figure and its echoing faint variations occupy their own space, which the movements and adjustments of pose help generate and define. The figures are ranged across the surface in frontal poses, and in flat frieze-like sequence and rhythm.

They each seem to stand in somewhat wary isolation, their private worlds scrupulously respected and held apart, except for the purpose of allegorizing the artist's life and range of human intimacy. In the center, more fully realized, is a black model, her dark warm flesh beautifully painted, bearing aloft the faint outlines of a banner on which the artist had written, and then erased, "Liberty." Over the scene broods the romantic and intense visage of its creator, in the form of a drawing pinned to the wall at right.

In preparing The Studio, Rivers made numerous preliminary sketches and studies of the full pose and various details. "These paintings consist of the faint remains of all the things that I did not want, that the whole canvas wouldn't give up no matter how much I scrubbed, scraped or merged," Rivers has written, "so in a way, all of it grows out of an abundance of dissatisfactions."

This evidence of process manifests itself in other ways, too, notably in the use of multiple imagery and in the prominence of unfinished areas, where the essential aspects of various elements such as the pattern of fabric or the structure of furniture, are schematically indicated rather than fully rendered. So much flourish and small invention in linear detail and elaboration give the images a stuttering and fragmentary legibility, but life, movement, and a pervasive sense of well-being register with great vividness. The discriminating balance of sketchy incompleteness and full realization, where required, and the random scattering of bright, minute particulars give the painting its distinctive originality. Thus despite its elliptical and impressionistic handling, The Studio comes off as both abstract invention and observed fact, the artist's life and milieu opening themselves out to the eye like an unfurled scroll.

Marisol Escobar
American, 1930 -
Cocktail Party, 1965-66
Wood, mixed media; life-size

Prior to the 20th century, sculpture was considered an inherently "unfeminine" art form because of the physical demands it placed on the artist. Those few women who were moved to sculpt might succeed in the artistic sense but at the same time ran a risk of public censure. How different then is Marisol Escobar, who mastered skills that people considered appropriate only for men, working with a power drill and saws and all sorts of carpentry equipment that women aren't supposed to know about.

Simultaneously, in the mid-to-late-1960s Marisol (as the artist calls herself) was the darling of the society and fashion set, and was dubbed by Andy Warhol "the first glamorous girl artist." These seeming contradictions are in actuality the product of a life-long concern with identity.

Marisol was born in Paris in 1930, and raised there and in Caracas. Her parents were well-off Venezuelans who traveled and socialized extensively, and she and her brother were uprooted many times. When Marisol was 11 her mother died and the little girl was placed in a succession of schools, eventually in Long Island and Los Angeles. According to a 1975 interview, she was a confused teenager who disapproved of the "wild parties" her parents threw, refused to talk because she "didn't want to sound the way other people did," and had visions of becoming a saint. That phase lasted about two years, followed by expulsion from high school for being a "bad influence" on the other girls. Nonetheless Marisol discovered she was adept at drawing, kept at it, and confirmed her early desire to be a painter. Her father encouraged her in this and in 1949 she moved to Paris for a year's study at the Ecole des Beaux-Arts.

In 1950 Marisol returned to New York and became, socially at least, part of the Abstract Expressionist generation that made Greenwich Village its haunt. For a while she studied at Hans Hofmann's legendary school, where pupils learned to paint by dispensing with objects and conventional perspective and concentrating on the "push and pull" of plastic forces. In 1954, she came under the influence of the sculptor William King who introduced her to the cunningly conceived toys, signs and utensils carved by American folk artists, and taught her the techniques of modeling, carving and wood joinery. Attracted as well to the figural forms of Pre-Columbian Mochica pottery jars, which she saw in an exhibition about this time, Marisol jettisoned easel and canvases for wood and clay, and took the human figure as the center for her art. She worked hard at her new craft and in 1957 her first one-woman show was greeted with positive reviews.

Marisol responded emphatically to the Pop Art of the early 1960s with a succession of single figures and elaborate tableaux that demonstrated her uncanny receptiveness to what was going on around her. Sly, generalized criticisms of the rituals of American life, her sculptures treated such themes as hollowness within marriage and the family unit (especially domestic coziness and child raising), military might, social demeanor and the presentation of self to the rest of the world.

The Cocktail Party, dating from 1965-66, is a perfect example of Marisol's techniques and themes. The torso of each piece is a cube or rectangular block of wood. Onto these she has painted, stenciled, drawn and nailed other pieces of wood, adding details in plaster, plastic, metal, fabric and glass. The basic tableau is further augmented by real props, from her own clothing to street finds of toys, furnishings and appliances that act as a recognizable counterpoint to the fantasy of the figures. The juxtaposition of traditional painterly and sculptural methods with rough carving and battered objects alive with association is strong enough to support the coexistence of devastating criticism and playful humor.

Another device Marisol introduces in the Cocktail Party is the use of photographs, drawings and plaster casts of her face and body. These she includes as a means of self-identification, exploring the question, "Who am I"? Each of the faces is different, each a potential answer, each a mask. In this apotheosis of multiple selves there are 15 figures, male and female, all bearing Marisol's features, as if their creator were the ultimate assemblage or found object. Marisol continued this use of her face until 1976, when she gave up the search for self, explaining, "I don't have to do that anymore because I know I'll never find it."

Marisol has said that she intended the Cocktail Party to be a critical commentary on the inanities of women's lives, referring both to the kind of existence her mother led and to the elegant society women by whom Marisol was lionized. As she became recognized for her sculpture, writers from Glamour, Vogue, and Cosmopolitan cooed over her looks, her clothes, the parties she attended, and called her an enigmatic "Latin Garbo," because she never gave out statements or interviews. At first the attention seemed a little like reliving her teenage years and the artist went along with it. In time, however, the public obsession with her social life and silence trivialized her. Being categorized as a mysteriously unreal creature was, Marisol says, "a way to wipe me out. . . in the '60s the men did not feel threatened by me. They thought I was cute and spooky, but they didn't take my art so seriously. Now, they take my art more seriously, but they don't like me so much." It is hard not to see the Cocktail Party as being in large part autobiographical--concerned with the artist's youthful memories, her search for self identity in an artificial society, and, with its doll-like multiple figures, her feeling of being "wiped out."

Robert Rauschenberg
American, 1925 -
Autobiography, 1968
Offset lithograph; three panels each 66 1/8 x 48 3/4

Like Marisol and Rivers, Rauschenberg is one of the visionary artists who, in the 1950s and '60s, revised accepted ideas about the materials and subjects of art and the artist's role. He began painting at a time when Abstract Expressionism was the prevailing idiom, but while his work incorporates certain stylistic references to action painting, Rauschenberg never identified with the Abstract Expressionist view of the painting as a record of the artist's involvement with his materials at the time he encounters them. Instead, he has consistently suggested that he is not solely responsible for the character of his work; he is, rather, a contributor in partnership with objects selected from life.

The manner in which Rauschenberg's art encompasses a broad segment of experience has been paralleled in the wide range of activities in which he has engaged. After study at the Academie Julian in Paris, he returned to the United States and studied under Joseph Albers, a renowned exponent of the Bauhaus tradition of ascetic order and restraint. Following his training with Albers, he produced first a series of all white canvases, then a group of works in which black paint was brushed over torn pieces of newspaper that had been pasted on the canvas. With these works, Rauschenberg forcibly questioned the very nature of "the work of art." He attempted to show that the canvas was an entity comparatively free from the artist's control, and that as paint was merely an addition to or an extension of an existing object, he could therefore contribute to a painting without being completely responsible for its ultimate character. Beginning in 1953, Rauschenberg expanded this thought with a series of large collages that combined three-dimensional objects with the large format and spontaneous paint application of Abstract Expressionism. Finding no adequate term by which to call these curious amalgams, he dubbed them "combines." The word is an accurate description for the artist's mixture of "real" and "created" forms, of "found" objects and paint. By bringing into his art all kinds of objects and images that were originated outside the painting by other people for different purposes than the artist's use, he invited the spectator to again consider the nature of art and the artistic process. By the late 1950s Rauschenberg sought new ways of bringing together selected forms and created forms. In 1963, he hit on the technique of combining silkscreen reproductions of photographs with richly painted forms. He continued to incorporate both created forms and images from life, as in the combine paintings, but now both were presented entirely in two dimensions.

Another aspect of the artist's concern for collaboration that is closely tied to his experiences as a print maker is his interest in the nature and uses of technology. Contrary to those in the 1960s who saw technological progress as a monster, Rauschenberg frequently celebrated human-equipment interaction. Embracing technology as a potential force for good, he saw the artist as a model of the necessary works of "participation with technicians" and in 1966 he founded an organization designed to orient artists in a world of complex technical resources. Rauschenberg was also one of the first artists to extend his field of activity to environments and happenings, and for several years he was interested in dance, both as a performer and a choreographer. Much of his performance work was highly improvisatory, with sets and costumes made in the particular environment and creative decisions spontaneously dictated by aesthetics and practicality.

"Theatre remains one of the most demanding and purest forms of art," Rauschenberg has said. "There is no separation of life and work. The individual is the medium."

Autobiography, an enormous offset lithograph, was produced in New York in 1968. It is packed with the occasions of cooperation as well as visual references to nearly every phase of the artist's creative development. It was produced for Broadside Art, a publishing venture established to utilize billboard presses as an art medium for visual journalism or information. Part of a proposed series, the print was intended to be a seventeen foot vertical format printed on one sheet. This factor was too difficult to allow easy mass production, which was one of the prime considerations of the artist and publishers. The finished lithograph was printed, instead, as three vertical panels of equal size, each a self-contained coherent composition.

The first or top panel incorporates an x-ray portrait of the artist, which he had used in his first major print series (Booster and Seven Studies, 1967), plus his astrological chart (Libra) and other images frequently found in Rauschenberg's paintings and prints. The central panel has written autobiographical material surrounding a childhood photograph. The final panel includes a photograph of Rauschenberg performing his first dance piece, "Pelican," shown against the New York skyline, a water tank from his hometown of Port Arthur, Texas, and a navigational sounding chart of that city's coast line. Combining past and present, old work and new, visual as well as verbal quotes, technology and the hand crafted, in Autobiography, Rauschenberg sums up his personal and artistic journey at mid-career. It is the ultimate statement of the man who said, "I'd really like to think that the artist could be just another kind of material in the picture, working in collaboration with all the other materials."

Expressions of the Self: A Course Description

One of my favorite courses to teach and one about which my students are most enthusiastic is "Expressions of the Self." I enjoy teaching the course because I'm interested in the meanings we give to self and in the ways in which self is represented to the world. My students enjoy the course because they have the opportunity not only to examine the ways in which various creative people have presented themselves to the world but also to reflect on and create various presentations of their own selves.

This ten-week, college course is divided into four units: **1) What is Self? Who am I?; 2) Written Presentations of Self; 3) Visual Presentations of Self; and 4) Lifestyle Presentations of Self.** Class assignments and activities are planned to help students work on skills in writing, speaking, creativity, and literary and artistic analysis. Class materials are chosen so that there is a balance of male and female subjects and a representation of cultural diversity. In each unit, students have some kind of activity or activities that call for them to do themselves what they have studied others doing.

We begin Unit I: What is Self? Who am I? by discussing a variety of definitions of self given by such people as Erik Erickson, Erich Fromm, Emily Dickinson, and Carl Rogers. We talk about philosophical, psychological and sociological descriptions of self and identity. One day students are asked to present orally their own definition of "self" and then, for the next class period, to write a one-page definition of "self," answering such questions as: Of what is self composed? What is essential to the self? Is it the same over time? Do others see it? understand it? know it? Where did it come from? How does it affect a person's life? What is the relationship of self to others?

Next, students read the play No Exit by Jean-Paul Sartre. The play is a good one, not only as a basis for a discussion of existential views of "self," but also for discussions of the relationships between self-concept and physical appearance, gender, and economic class. We consider these issues in connection with the characters in the play and, by comparison, with those aspects of our own selves. We also consider how people's motives relate to their self, what difference others' views make in the determination of self, and how evil or goodness relates to self. These discussions lead naturally into a second brief oral presentation and then to another one-page paper in which students respond to the question: "Who am I?" In this paper I suggest that they answer one or more of such questions as: What is essentially you? What do you value in life? What behaviors or responses are typical of you? What makes you unique? What gives you your identity over time? and What do others see in you? Because the paper is so short, students are urged to focus on one or two aspects central

1019

to who they are, rather than trying to explain their complex self.

After this three-week introduction to concepts of self and some initial straightforward descriptions of ourselves, we turn our attention for the rest of the quarter to the creative ways in which people have presented themselves to others. In Unit II we study **Written Presentations of Self.** Our studies are based upon autobiographical writings in R. Lyons, ed., Autobiography: A Reader for Writers (1984). This anthology is a good one, because selections are grouped according to topics such as "events," "places," and "people," and introductions about the use of various literary techniques accompany each section. Our discussions in this unit focus not only on what we learn about the authors' sense of self from their descriptions of events in their lives, places they love, or people whom they have known, but also on the literary techniques by which authors make their writings come alive for readers. We discuss authors' choices about beginnings and endings, inclusion, emphasis, point of view, specific details, analogies, generalizations, and organization. We read pieces by Frank Conroy, Maya Angelou, Lincoln Steffens, H. D. Thoreau, Alfred Kazin, Wright Morris, Patricia Hampl, M. Scott Momaday and Lillian Hellman. We practice writing single paragraphs on related topics in our own lives and then critique them with partners.

At the conclusion of Unit II, students are asked to write their own autobiographical essay and to analyze it. Again, they are reminded that they will have to choose to write about some significant aspect(s) of their lives--an event, person, place or some combination--rather than about everything in their past. They are encouraged to apply the literary techniques we have been seeing others use in the telling of the lives. At the end of the autobiography, they are asked to attach a one-page explanation of what they were trying to show or explain in the autobiography and what literary techniques were used or decisions made as the autobiography was written and revised. I have found that the second part of the assignment assures more conscious writing in the autobiography and also helps me to see what the students have learned about analyzing autobiographies. Because the autobiographies turn out so well, we duplicate them (minus analyses) so that everyone in the class can read the whole set.

In Unit III we turn to **Visual Presentations of Self.** We begin by learning to read self-portraits from clues in the facial expression, gaze, body language, and surroundings as well as in aesthetic choices of color, proportion and lighting. Students study portraits from Vandevanter & Frankenstein, eds., American Self-Portraits (1974) (now out of print, alas!). I assign about twenty portraits, ten male, ten female, to be studied in depth. Next students go to look at a series of less traditional self-portraits, this time photographs accompanied by each photographers' comments in In/Sights, ed. Joyce Tenneson Cohen (1978) (also out of print!). Finally, students read the documentation and see slides from a series of performance art activities by Ginny Lee Klauder, entitled She (private printing), the activities of "a woman in search of an honest existence for herself."

In preparation for asking the students to create their own visual representation of self, one day I have them break into small groups and practice posing themselves in ways that in a photograph or painting would show they were at peace, or serious, or angry, or playful, or self-doubtful. On another day I bring crayons, markers, scissors, construction paper and glue to class and each of us creates an abstract representation of our self and then explains it to the class. Throughout this time in the course I have to coax the students to forget that they "have no artistic ability" and to believe that they can be creative. My participation along with the students in these activities leads to a more relaxed, more trusting, and, thus, more creative atmosphere.

At the end of this unit, students present some kind of visual self-portrait to the class, whether it is a drawing, painting, collage, sculpture, photograph, silent film, performance art or whatever. Amongst many outstanding projects I have received, I will never forget the colorful mobile of aspects of self made by one thoughtful, older student, or the ski decorated with significant memorabilia by a young athlete, or the haunting gaze from a sculptured head (made on a wig stand) by a self-discovering artist. While many students are tempted to put together a collage of photographs of family and friends on a bulletin board, those are often not the most successful self-presentations because students are likely to err on the side of quantity rather than making careful choices about what to include and what to exclude. In class, students explain their self-portraits, just as they analyzed their autobiographies, explaining their aims and the clues, symbols, and aesthetic techniques they used to accomplish those aims. The most memorable moments of the entire course come out of this visual-oral activity as we discover the creative and unique selves that make up the class.

We conclude the course by reading Isadora Duncan's My Life and by talking about Lifestyle Presentations of Self. Students either love or hate Duncan, so her autobiography stirs impassioned debates about her belief in individuality, her concept of self, and her attitudes towards other people. We answer questions about how her sexuality, values, lifestyle, and vocation reflect her sense of self. We look at a tape of her dancing (for a hidden camera) and of others dancing in her mode (because she would not dance for cameras) and discuss how her theories of dance reflect her views of self, sexuality, and nationality. We compare Duncan's views and lifestyle with our own as a way of making some final concluding remarks in the course.

I have evaluated students' work in this course in relatively standard ways by giving credit for class participation (25%), by assigning grades to papers and projects (50%), and by giving a final exam (25%). The great difficulty in evaluation is the dilemma of whether or not a project that I view as "haphazard" or "confused" might be an accurate representation of self, rather than a poorly done project. I have decided, therefore, in the future to put this course on contract grading, so that together the student and I make the determination of the course grade. On the whole, students have been so enthusiastic about the course that I believe that anyone who would contract for an "A" would certainly deserve that at the end of the course.

Technology As An Enhancement of Expression

The self-portrait examples illustrated in this paper [and throughout the issue--editor's note] were produced in a course that is designed to be an exploration of combinations of both linear (verbal concept) and nonlinear (visual image) thought processes using the Macintosh computer as the basic working tool. One reason a major portion of the course concentrated on visual processes is because, apparently, even though we academics appear strongly in favor of 'visual literacy,' little real time is devoted to this topic in the university curriculum. The course emphasizes the use of the visual power of the computer and its back up technology to understand and experience the relationship between producer (Who is the maker?), process (How is it made?), product (What is made?), and place (Where is it made?).

The goal of the course is the technical and intuitive mastery of the computer as a powerful and unique creative visual tool. The course is designed around the premise that we can access, when needed, the vast wealth of visual information we have stored and organized in some way in memory. We are not usually conscious of this visual information, even though we continually use it in our encounter with reality. An underlying hope of the course is that it can, to some degree, aid in seeing the ordinary in unique ways, leading to the excitement of a 'safe' encounter with the unknown and to an 'operational' definition of creativity.

Computer and self image (portrait)

This work was done in a class titled: Technology as an Enhancement of Expression. One of the two class meetings was in a computer lab setting, in a room with two large monitors and twenty Macintosh computers. The class of eighteen consisted mainly of graduating seniors who are computer science majors. This major gives these students a strong background in electrical engineering, mathematics, and computer programming. These students had no background or involvement in the visual arts. Until taking this course, some of them had not taken the time even to begin to explore the graphic potential of the computer.

Early in the course each student makes a digitized self-portrait, i.e., a photograph which is composed of black and white dots (pixels). The image is then placed onto a disk which contains a powerful graphics program. This program allows almost limitless visual manipulation of the photograph on the disk. For example, the program allows modification of the pixels, either one by one or in clusters. These pixels are the building blocks of the original photograph. With the tools available in the graphics program, the portrait may be worked on with a freedom of choice similar to what a studio painter has at his or her command.

Some of the following digitized self-portrait exercises or modifications of them were used in the course:

1. Put together two left sides and two right sides of the face, label them and then find symbolic words to describe the difference in the two portraits. Incorporate the words into the overall design. Use color in the exercise if you like.

2. Make a 'good' and 'evil' portrait from the original, and use color to enhance or exaggerate the difference in feeling.

3. Convert the digitized image into a line drawing that is still recognizable.

4. Randomly remove as many pixels as possible and still maintain the image so that it is recognizable.

5. Turn the portrait into a 'cubist painting' or some other well know art style.

6. Make the portrait into a mandala using the portrait image or a part of it. Work with the line drawing or the reduced pixel portrait if the full portrait is too complex.

7. Change the sex of the portrait (male to female, female to male).

8. Have the students exchange disks--male gives a disk to a female, female to male--and then have them change the sex of the portrait.

9. Keep the features of the face but alter the overall shape of the head.

10. Make a portrait of yourself as a monster (Hollywood or Japanese movie style).

11. Change the face into a character from another time and /or culture, e.g., for my students, American Indian.

12. Make a collage by cutting or tearing the portrait into pieces and pasting them in a new configuration onto a background picture taken from a magazine. Use color with this exercise if you like.

13. Make a series of 'bizarre' portraits using the various graphics software tools.

14. Make your portrait into a professional, skilled or semi-skilled worker by adding 'visual hints', e.g., police officer, construction worker, nurse, nun, or teacher.

15. Use the self-portrait to create a dream-like image.

16. Place another student's portrait on your disk and make a composite face using your portrait in combination with it.

17. Use the portrait to create an imaginary dollar bill. Use a real dollar bill as a departure point to generate the overall design.

It should be pointed out that the self-portrait exercises listed above are only a part of a large variety of exercises used in the class. However, I felt very strongly that there was a certain intensity of focus, involvement and playfulness exhibited when the students worked with their self-portraits, which seemed unique and important within the larger structure of the course. Because of this, I feel justified in abstracting and treating the portrait exercises as an entity. I can only speculate as to what might account for the origin and strength of the students' response.

Speculation 1. It might be that having the ability to alter easily the self-image as represented by the portrait provided a unique opportunity for easing or blurring of habituated psychological self boundaries, not unlike the effect of wearing a mask and/or costume, or in some way altering our appearance by make-up.

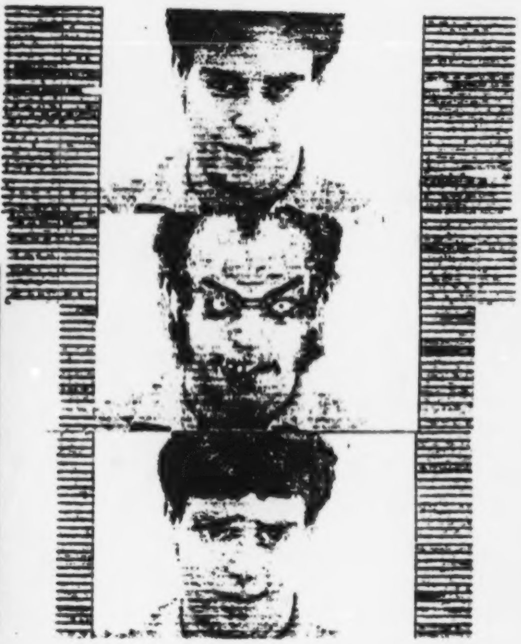
ABSTRACT



Unidentified Students--Drexel University

It might be understood as controlled regression, or a return to a kind of playful childlike 'magic' where one is transformed to an imagined self with the accompanying suspension of belief in consensus reality that occurs easily and naturally in the play/learning process of the child.

Speculation 2. Perhaps everyone in the computer lab felt the informality and freedom of the environment, which is reminiscent of an art studio. The only real difference is that students were working with portraits on a computer screen, and were using an electronic palette, rather than a canvas on an easel with paints and brushes.

The manner in which students moved around, commented, looked at each others' work, shared and asked for technical information (e.g., 'How did you get the hair to have that texture?') seems identical in spirit to the questions asked in studio art classes. We also had the tremendous advantage of working with an extremely accurate likeness of ourselves, which is usually only available to a fine arts major with some skill and formal training in rendering a photographic likeness.

Speculation 3. There was a real understanding and acceptance of the individuality of a student's personality and working style by members of the class. For example, one student sat contemplating his image on the screen for most of the period, and then went home to his computer and apparently spent a great deal of time completing the assignment to his satisfaction. He was usually asked by someone in the class, with a touch of awe in his or her voice, "How much time did you put in on that?" In contrast to that approach, another student worked continuously and rapidly, finished the assignment and printed it out in the one-and-one-half-hour class periods. I might add that he had the reputation in the class for incorporating the most words into his visual designs, when words were part of the assignment. A third student seemed always to radically change the assignment into a delightful, bizarre cartoon which the class always found amusing. We had our smiling resistant student who could be depended on to do the opposite of the assignment and do it well. In the line drawing assignment he made his portrait completely from pixels (dots). And of course we had an anxious student who always felt she had not fulfilled the requirements of the assignment. By the end of the term, she seemed to have had enough approval of her work from members of the class so that she was no longer as dependent on my assurances and reluctantly given advise. It would be possible to comment on each of the 18 students in the class in a like manner but I feel that the brief discussion of these four students demonstrates the general respect and acceptance of the individual ways of being in the classroom each student displayed.

Speculation 4. It may be that the continual working with, involvement in and sharing of something as personal as a self portrait could possibly engender a group dynamic similar in nature to Carl Rogers' 'person-centered' approach. Rogers describes the three characteristics needed for individual growth: 1) clarity or congruence, i.e., what a person is experiencing is available to awareness, can be lived in a relationship with others and can be communicated; 2) unconditional acceptance, caring and prizing of the individual, and unconditional positive regard; and 3) empathic understanding--sensing accurately the feeling and personal meaning being expressed by another person and communicating that understanding.

Compared to most classroom environments that I have any awareness of, including those few classes that expressed a real and active concern for individual growth, there seemed to be a much larger amount of this 'person-centered energy' at both a verbal and non-verbal level in this class. I would suspect that if the above statement is correct there was some valuable but informal learning about self and group process that occurred.

Speculation 5. Freudian psychoanalysts speak of 'making the unconscious conscious' as a major goal of their discipline. I cannot help but wonder if this series of portrait exercises does not make conscious to some extent the vast amount of visual information (personal and general) we have stored in past memory, which is ordinarily outside of conscious awareness.

There seems to be a substantial amount of data suggesting that facial recognition is a right brain function that deals with pattern recognition, and which does not lend itself to verbalization at a conceptual level. Perhaps students working closely with their new 'faces' in the exploratory environment of the class gained new insights into the structure and function of the imagination, i.e. how we form images and express them. Perhaps the class with its atypical use of the computer is a rather simple exposure to 'whole brained' cognition since there is obviously linear thinking as well occurring in the portrait work in which they were involved.

Speculation 6. The students tended to have positive experiences working with an extremely sophisticated visual image (the digitized portrait). These experiences were reinforced because of the easy access to the powerful yet friendly graphic program which allows them to freely manipulate the image. The students seem genuinely surprised by the highly finished quality of their work. Several of them remarked that they were not aware that they had any artistic ability before this experience. I tended to downplay this aspect of the course, since I feel one of the unique advantages and perhaps the most important reason for using the computer in this manner is that anyone can generate high quality visual products that seem to show artistic ability.

Speculation 7. There is value and positive reinforcement in the act of making something original which is personally satisfying, in an accepting and non-competitive group setting (how do you grade this course?). This experience is a direct encounter with the creative process and has the child-like quality of play which seems to be a legitimate basic learning process for many life forms--even students.

I profoundly believe that this experience is tragically missing to a large extent from so much of our educative experience--certainly it was from mine--and that this missing element is of vital importance in the education of the whole person. I believe the computer and its accompanying technology can and should be used more imaginatively in various academic disciplines to generate more of this kind of 'wholistic' learning experience.

Self-Portrait *Gigi Walsh--Cypress College*

Margaret Boegeman

In the Whirl of the Survey Course, How to Engage the Mind

In any humanities survey class, a problem every instructor faces is how to get students deeply involved with the creative works they are reading and viewing in such quick succession. The two semester, interdisciplinary class I teach (called on the Cypress campus, "Humanity and the Arts") races from pre-history to the beginning of the Renaissance in the first semester, and dashes breathlessly on through the twentieth century in the second. Slides of paintings, sculptures and architecture whirl dizzily before students' eyes, and the panoply of literature is even more discontinuous, because fewer selections are sampled. No sooner have we celebrated the Egyptian Hymn to Aton than this dazzling praise of life seems to terminate in the gloom of "The Waste Land."

To counterbalance this dizzying march of the centuries, I make an assignment each semester which aims to engage the students in an intimate and in-depth understanding of one creative work. We call this assignment a term paper, but its structure and purpose are unusual insofar as research skills are the least important element. They are simply the initial effort upon which the "real" paper is written.

The assignment is also unusual in that success is largely dependent on the degree of a student's engagement with the work chosen. That is, effort is its own reward. Since the only prerequisite for this lower division class is clearance for English composition, the course draws students with a wide range of abilities and interests. This assignment allows those with little background in the arts as well as those with a great deal to succeed. Though some writing skills are necessary, if the student displays interest and diligence, he/she will be rewarded with a successful paper. A wide range of topics gives the opportunity to indulge every aesthetic taste.

The first requirement is to choose an art form or an artist the student would like to investigate. Students may choose from the visual or verbal arts. As the choices are limited to the periods and genres covered each semester, there are more generic studies the first semester (e.g. Greek vase painting, Egyptian tomb construction, English morality plays), and more studies of individual artists the second semester. The students are required to read a full-length book on the work or the artist. If they choose to work on literature, they read a primary text: a novel, play or collection of poems or essays instead of a biography or critical text. In the first semester, I hand out a list of genres from which to choose; in the second semester when the artists' names are more familiar, the students can select according to their preference. However, I must approve the book they select, and I screen for length and difficulty. If the work they choose is literary, it must be something other than what we read and discuss as a class.

The first section of the paper simply requires a three or four page summary of the work they read. A critique of the book is desirable but not necessary. So far the assignment is quite commonplace.

The second section of the paper is the controversial part, but surprisingly, often the most effective. For part II, they are to produce three pages in the style of the art form they have read, or read about. I assure them that they will not be graded on the quality of their drawing or poetry, but only on how seriously they engage with the form. Someone who cannot draw at all may still wrestle with the problems of designing a building, planning a sculpture or composing a picture. Likewise for the literary forms: the imitations need not be original or elegant, but the efforts must duplicate some, if not most, of the formal qualities displayed in the original work.

If they choose a literary work, they may add a scene, update a section of the work, or write an imitation from their own point of view. If they choose a visual work, I want to see on the three creative pages, three different aspects of the artist's efforts. In architecture, this means an elevation, a floor plan and a rendering of a decorative detail. In sculpture, a front and side view, plus a detail. In painting, three different subjects and three different styles and/or materials.

In the second semester, most of those who choose a visual form choose painting, and, since portraiture is a common denominator among most post-Renaissance painters even into the twentieth century, I recommend that one of their creative pages be a self-portrait, rendered in the style of their artist. As I learned when I was an art student, we care much more about the final product if it represents us.

After they have completed the creative section, their third requirement is to analyze what they have learned from the combined efforts of parts I and II. What discoveries have they made about the creative act; what aspects of style did they try to reproduce and with what success; and what were reasons for any failed attempts along the way? This is the section that shows me not only that they have done the required work, but that they have *thought* about what they were doing. This is the section where there is no possible evasion of the issues, no cribbing from Cliff's Notes or rhetorical padding to impress the teacher. This is the section where they not only engage with the art form, but also with their own critical and creative minds. And they do so to their great satisfaction and mine. For once in their college career, they do not have to strain to find something to say. Their analysis will be based on their own experience, but also grounded in their research and an understanding of the history, psychology and aesthetics of the period.

The outcomes of the assignment are multiple: as my title indicates, the paper offers one in-depth experience to a breadth course. It gives the students a working understanding of the creative act. It also provides them not only with an occasion to learn, but also with an occasion to think. That is, the analytic motivation comes from within them, not from the assignment sheet or the desire to please the instructor. The insights are reinforced at affective and kinesthetic levels as well as cognitive ones, and therefore are more lasting.

The success of this experiment has astonished and delighted me. From the last class I taught, Spring of 1988, twelve papers were turned in: eight received A's, two received B's, and two received C's. Not a bad distribution. Of the two C's, one was from a student who simply didn't have the writing skills to express his ideas, and the other was from a student who had misunderstood the purpose of the analysis in section III.

The other students, many of whom had difficulty remembering the myriad of names, places and periods on an objective exam, or could not write an essay in class under the pressure of time, demonstrated the seriousness with which they took the creative process by the scrupulousness of their reports and the delight of discovery with which they were written. Of course, they all acknowledged their own limitations in imitating the artists selected, but this was only a minor theme. A much more dominant theme was their pride in self-discovery, both in the creative effort, and even more in the observance of themselves at work, real work, not perfunctory performance for a grade. They actually could make discoveries, original comparisons, and analytic conclusions; their minds were active because they were involved in the process of learning, not just witness to it. As one student concluded, "I know now not to dismiss an artist just because I do not like his works. I also learned that the creative process is very difficult and intellectual, unlike the romantic idea that art is created by inspiration. This is the first time in my education that I can truly say that I learned something that was worthwhile." (This came from a student who is an impressive overachiever. Putting aside the possibility that he may have been saying merely what he thought was expected, I was struck by the dismal thought of his gathering information without assimilating knowledge, a too frequent pattern in all our classes.)

While the artists the students selected this semester were famous, they were not necessarily easy to copy. The painters included Rembrandt, Van Gogh, Matisse and Kandinsky. The latter two stimulated particularly successful papers, not because of the simplicity of their styles, but because the students writing were determined to reproduce with some success what looked to be accomplished with ease. The student working on Matisse wrote, "My Lady in Blue attempts to experiment with Matisse's...large, flat expanses of color, ...by plain, geometric patterning, and by the relationships of the colors themselves. This technique appears almost childish in its simplicity...[u]sing the same ... colors--red, yellow, blue, white and black--the same broad, flat shapes and the same geometric patterning, the master and I do not achieve the same results....[This effort] serves to make a crucial point about Matisse's art in general ... that it is deliberate and calculated in its apparent simplicity, and its character is the end result of a long series of painstaking efforts."

The literary works selected were even more varied and challenging: Pilgrim's Progress, A Portrait of Dorian Grey, Orphee, The Sacred Wood, Portrait of the Artist as a Young Man, The Last Tycoon, A Clockwork Orange, and The Ambassadors. The selections, particularly the writing selection, proved interesting opportunities for self-explorations, and autobiographical revelations. Some were obvious: Pilgrim's Progress was chosen by a young man with a firmly grounded religious conviction; A Clockwork Orange was selected by a young woman who frequents the artistic fringes of our middle class community; The Sacred Wood by the student most serious about his commitment to literature; Orphee by the student enraptured by avant garde art and the Romantic conception of creation. Other selections were revealing in their opposition: A Portrait of Dorian Grey was the selection of a Vietnamese immigrant. Still steeped in tradition of responsibility and familial loyalty, he found it impossible to write from the perspective of Wilde's aestheticism. He chose instead to reproduce his scene through the mouths of lower class characters in the book, whose sense of material reality was more urgent than Dorian's.

The Last Tycoon was the choice of a young Korean man, who, while never assuming he would become familiar with the inner circles of society about which Fitzgerald wrote, nonetheless aspires to Fitzgerald's style. Chuck has, in fact, a very relaxed and pleasant conversational manner to his writing, but acknowledges the difference in styles when he says, "Fitzgerald has a fluid graceful motion to his style. Mine has more

1031

of a bounce to it (if you can understand that). I think I could have done better if I had written a story ... by John Irving ... I feel my style is similar to his."

Portrait of the Artist as a Young Man was the selection of a young woman, who found herself repulsed by the arrogance and sexism of Stephen Daedalus. Her revenge was to transform the scene of Stephen waiting for his father in a Cork bar to a hospital where Stephen awaits the birth of his first child. Stephen fantasizes that it will be a boy, who will learn from him and follow his aesthetic-heroic path. My young student wrote a fine Joycean comeuppance as Stephen is rewarded with the announcement of twin...daughters.

Perhaps the most difficult book chosen, which was also the subject of the most successful paper, was James' The Ambassadors. This was selected by a young man who knew nothing about James but his reputation. As Matt, my student, has writing ambitions himself, he decided to see what he could learn from this old master. Matt handed in his paper with the sequence of sections out of order. He opened with his creative imitation, followed by the book review, and then gave the critique of his own creative effort. This was a shrewd presentation move. His creative imitation was good, capturing the inward vortex of his character's thoughts: "She heard this, expecting, wishing, that it would have been something altogether different, something more, some reciprocity of sorts, to the effect, say, of what it was that she, up till this latest rejoinder, had been feeling herself. It took her by storm, as it were, to think that she had so unutterably failed their situation. She found herself feeling exceedingly rash and and almost as though she had abridged their relationship by even, so far as she did, suggesting that things be other than they were."

In Matt's second section, the summary and critique of the novel, the phrases were predictable: he found James "needlessly oblique", with "long-winded elaborations", etc. There were, however, also some comments that hinted at an analysis of structure. "[In the] two stories, the character's and the storyteller's...there exists the novel and its critique simultaneously." "[The] characters [seen] in competition with their storyteller...seem rhetorical conveniences [,] quotes interwoven in a soliloquy." The emergent structural analysis in fact leads quite effectively to the third section, the critique of the creative attempt.

"What I once found oblique, I now admit to being creative and purposeful," Matt begins. "At first, I merely superficially imitated James' style without it serving the purpose of my story. Then I began to see use for the parenthetical phrases and long elaborations. I began using these to qualify the action, to discuss everything that was occurring."

Matt had also objected to James' point of view, claiming in his review section that the wrong character narrated; but in his evaluation of his own creative effort, he discovers differently. "[L]imiting the story to Strether's perspective, allows us the same ignorances...we suffer Strether's conjectures and speculations. We share his frustrations; but we also share his development...[a]nd thus we are welcome to experience his predicament." "This [technique] allows James to disclose ...Strether's psychological state." "What...matter[s] is participating in the maturation process of Lambert Strether, the awakening of his American consciousness."

Finally, Matt acknowledges, "I have gained, through this grand 'experiment', a fascinating, provocative insight." James' style may be difficult but its effect is powerful. "It is characteristic of emotional appeals, pathos, to be initially poignant and then to dissipate, whereas intellectural appeals, logos [tend] to have a post-effect which is altogether more substantial and provocative."

In a final, additional section of his paper, Matt demonstrates his lesson again, by giving just the dialogue of his creative effort (part one) without the intriguing, hesitant, qualifying interior monologue. Thus he proves to himself and to his readers the limitations of movie script language ("When?" "How?"), simple conversation tags unfiltered through a reflective mind.

In this assignment, Matt has recorded a piece of intellectual autobiography, the progress and changes of a mind actively engaged with its subject. In a humanities class, this is the experience we would chose for all our students. In this class, for this assignment, each student did chose to be so engaged.

The binding together of students with the creative experience is effective because they are asked to analyze not what someone else has done, but what they themselves have attempted. All the time that they are reading the text by or about the artist, their imagination is engaged: How did she get that color? Where did he find that model? How could she think of those words to describe a simple sky? Who should be telling this story? We might like them to consider such questions without the intermediate step of plying their own talents, but the creative act lends to the critical analysis a more profound understanding than we would get by asking students to use their intellect alone. I believe the assignment is an appropriate counterbalance to the rush of material covered in the survey course. But it is also a satisfying and successful experiment on its own, particularly for developing the students' sense of themselves as actors within the intellectual arena, rather than as simply spectators. The objective distance we seek in a student's analysis too often translates to mere indifference. Engagement results in stimulation; imitation produces understanding; and analysis offers self-assessment. Through this method, enrichment in the humanities is not simply observed, but owned.

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

IT'S DONE WITH MIRRORS

Portraits of the Artist: The Self-Portrait in Painting by Pascal Bonafoux. Skira/Rizzoli: New York, 1985. $37.50
Reviewed by Fred Schroeder.

The illustrations alone justify buying this volume. Almost two hundred self-portraits are reproduced, 130 in the gorgeous and accurate color associated with Skira art books. Some are predictable, like seven Van Goghs, six Rembrandts, six Goyas, five Dürers; some surprising, as with nineteen self-portraits by Gustave Courbet; and some quite new to most friends of fine arts. Among the last are self-portraits by women artists, beginning with medieval nuns (Claricia and Guda) whose self-portraits appear in margins of illuminated manuscripts and going on through Katherina van Hemessen, Sofonisba Anguissola, Artemesia Gentileschi, Elisabeth Sophie Cheron, the astonishingly lovely Elisabeth Vigee-Le Brun and Adelaide Labille-Guiard (both admitted to the Academy on the same day under the patronage of Queen Marie-Antoinette), Hortense Handebourt-Lescot and Therese Schwartze. They are not separated as "women artists," however, because each exemplifies one of the three-score themes that Bonafoux employs as ways of deciphering self-portraits.

One of the Vigee-Le Brun paintings, for example, is under "Allusive Headgear"--she was inspired to depict herself in the style of Rubens--, while Haudebourt-Lescot chose a beret which helps to define her northern heritage, a type of headgear originating with Dürer and Rembrandt, and practically *de rigeuer* for nineteenth-century German Romantics, as in Wilhelm von Schadow's triple-portrait of himself, his brother and the sculptor Thorvaldsen.

Such national and social keys appear throughout the book. Simon Vouet proudly exhibits a long lock of hair dangling over his collar to emphasize his association with fashionable Parisian elegance of the seventeenth century; Luis Melendez wears his hair in the *panuello de cabeza* affected by the dandies of Madrid. And Rubens never portrayed himself as a painter, but as an honored man of the Court. As these examples suggest, this is no ordinary book of art history, but he is also a novelist and writer of film scenarios--and he is a French scholar, so the approach is semiotic. His aim, he says, is to define self-portraiture as a sign rather than a genre; a sign like those of the zodiac which defines a whole identity. All is cipher, "bearing the seal of identity; everything that is impressed upon the portrait must be deciphered."

One result of this approach is that the volume has almost no progression. It is more or less chronological, but the reader can select readings at any point. Page through, and wherever the portraits engage your curiosity, read the adjacent essay. Some are only a column, a few others three or four pages. The style is strange at first, but partly this is due to Bonafoux's using an approach dear to the hearts of humanities teachers: unanswered questions abound, such as Who am I?, What is the artist trying to tell us? Why are Ingres' mirrors all inaccurate? Why does Carravagio depict himself as decapitated--once as the head of Goliath in the hand of David, once as the female Medusa, her *coif* of snakes including one twisting to lap the blood flowing from the neck? Cristofano Allori depicts himself as the decapitated Holofernes, and his mistress was the model for Judith, while Artemesia Gentileschi appears to have served as her own model for Judith, but whose head is in her basket? Lucas Cranach seems to have modeled himself as Holofernes, but who is his neat, self-possessed fashionable Judith?

The mystery is partly in the mirror. The medieval nuns had no mirrors, and so their only identity is in the written name, but from Flippino Lippi on, the mirror, which forces the painter, the painting and the art-viewer to look eye to eye into the puzzle of identity, is central. The mirror also has rendered a remarkably large number of artists as left-handed. Bonafoux, too, asks the question: are self-portraits really portraits of a mirror?

This volume is too abstruse and too expensive for students, but for any humanities educator, it is a mind-opener. One cannot but find new insights into the interpretation of self-portraits and fresh views upon the eternal fascination with expressing oneself.

SENIOR STYLES

"Commentary" (on Old-Age Style symposium) by Julius S. Held in Art Journal, Summer 1987. College Art Association, 275 Seventh Avenue, New York 10001. $16/year; $5/issue.

Serious students of bumper stickers will recognize that there is an "old-age style" in America. *We're spending our children's inheritance; Let me show you pictures of my grand children; Sexy senior citizen on board;* etc.

But is there a style that is inherently part of an artist's life, something that reflects the maturing passage through seven (or three or twelve) "Ages of Man?" Certainly it is possible to trace stylistic change and evolution through the life and works of an individual artist--indeed, it is almost a cliché of academe to do so. Germanic art historians coined a word for the general phenomenon, *Altersstil,* old-age style, and from studies of such artists as Titian, Rembrandt, Goya, Beethoven and others, scholars discerned such characteristics as greater emphasis on the abstract rather than on concrete detail and greater "spiritualization." This issue of Art Journal was devoted to publication of papers on Altersstil in Leonardo da Vinci, Bernini, Picasso and Chinese art, and in his Commentary, Held, an emeritus professor of Bernard College, views the entire prospect skeptically.

Art historians often castigate their craft for dwelling too exclusively on biographical approaches. To examine such an idea as *Altersstil* requires comparative, interdisciplinary and probably statistical studies,

1036

none of which are served well by studying one artist and generalizing on the basis of like evolutions among a select few Great Names.

Also, what constitutes old age? Rubens and Rembrandt both died at sixty-three, mere striplings compared to Picasso's last productive decade before his death at ninety-two. And what of artists who died young? Had such people as Mozart, Schubert, Masaccio or Caravaggio fulfilled their creative potential? How about suicides like Van Gogh? Are his last self-portraits equivalent to old-age style?

Generally the stylistic autobiography is regarded as irreversible: Old Dürer can't draw like young Dürer, old Beethoven can't compose like young Beethoven, and so on. And it is possible to juxtapose two works, one of old age, the other of youth, and feel certain of the inevitability of Altersstil. Held does this with two works by Goya, but he also juxtaposes two works by Ingres and two by Matisse about which "you could make a case in your introductory course" that reverses the real chronology. Held also notes that the article in their issue about Leonardo shows not only that an enfeebled *Altersstil* is found in early sketches, but that in old age, when concrete detailing was called for, Leonardo could still do it. (F.S.)

IDEAL SELVES

"'I Janus:' Privacy and the Gentlemanly Ideal in Rembrandt's Portraits of Jan Six" by David R. Smith in Art History, March, 1988. Association for Art Historians, Albert House, Monnington-on-Wye, Hereford HR47NL, England. $40/yr.

One of Rembrandt's great patrons and friends was Jan Six, poet, humanist and burgomaster of Amsterdam. There are two portraits of Six, one an etching with the subject, full-length, leaning on a windowsill reading in his study; the other a three-quarter length painting, showing him drawing on a glove preparatory to leaving his house for the world outside.

The relationship of portraits and biographies to self-portraits and autobiographies is often too glibly seen as totally distinct. But in the case of a portrait, at times--and possibly always--the act of choosing to have a portrait taken is in itself an act of self-expression. We all have favorite pictures of ourselves, ones that we feel are accurate representations of who we want to appear to be to others and to ourselves. For our students, these accurate representations of self are usually whatever is closest to pictures in magazines; for maturer and more sophisticated people, the accurate portrayals probably come closer to what we see in art books and galleries. We want to look like a portrait by Karsh, or Dorothea Lange, or Matthew Brady, or Cassatt, Eakins, Gainsborough, van Dyke, Rembrandt.

You know. Thoughtful. Introspective. Profound. Noble. We are never far from conventional representations of self, and this was true even for our greatest examplars, as Smith traces the conventions of the glove in portraiture, the arm on the windowsill, the subject posed on a threshhold between indoors and out. There are numerous antecedents for Rembrandt in works by Titian and van Dyke as well as in contemporaneous Dutch and Flemish lesser lights.

1037

And yet Jan Six saw not conventions in his portrait, but a real expression of himself, for he wrote a little chronogram (sort of an anagram that contains dates within), translated as: "This is the face I Jan Six had; I who since childhood have worshipped the muses...." But Smith (who is at the University of New Hampshire) notes that Six latinized his name not properly as Ionnus, but as Ianus, Janus, the two-faced doorkeeper god of the Romans, His pose, therefore, of introspective face and active hands, poised on threshhold, is an expression of the division of private and public self. Most cognates of Rembrandt's conventions are markedly public faces. "This worshipper of the muses" is turning away not only from introspection, but also away from the proper domain of gentleman-humanist, his private study. And what are the sources for that convention? Castiglione. Rembrandt, says Smith, found ways to express *sprezzatura*: "essentially untranslatable, it refers to the absence of an appearance of posing, to a quality of effortless grace and nonchalance..." Being cool, we might say. Where did Rembrandt discover this? Probably from Castiglione by way of Titian and Raphael (Rembrandt couldn't have read The Courtier), but in himself as well, for the real antecedents for these explorations of private, cool, introspective intellectuality seem to be Rembrandt's engraved self-portraits where he expressed his own division of public and private, as well as an air of *sprezzatura*. (F.S.)

SONGS OF OURSELVES

"Wordsworth, Whitman, and Us: Finding Personal Relationships" by Kenneth E. Resch in English Journal, April 1988. 1111 Kenyon Road, Urbana, IL 61801 $35/year; $4.50/single.

Adolescents are romantics in many ways. More emotional than rational, they tend to relate the world to themselves, or, when looking outward, to see events in relationship to ideals. This being true, one would think that the great romantic writers would appeal to them. Too often this is not the case and we can envision good enough reasons. The language of poetry is a foreign tongue, and most students have not been exposed to any sort of philosophic musings outside of Readers Digest and reruns of M.A.S.H.. And then, when the romantics like Wordsworth and Whitman are presented as poetic revolutionaries in the history of literature, the intense personalness of their poetry is reduced to historic data.

A bridge is needed, and for Resch, who teaches at Hempstead High School in Dubuque, it is the teacher who can serve as an autobiographical link. Romantic poetry "lends itself especially well to personal reflections." Reading aloud from such works as Wordsworth's The Prelude and "Tintern Abbey," Resch shares personal associations and memories with his students. Then, as he reaches Book 9 of The Prelude where Wordsworth reflects upon a piece of rubble from the Bastille, musing about the changes in his thought from youthful past to now, Resch once more shares both trivial artifacts from his own past and the memories and thoughts that they evoke. In a latter-day show-and-tell activity, his students bring things from their homes--foreign coins from their forebears' homelands, childhood toys, photographs--and thereupon write descriptive snapshots (or poems, if they like).

"Yet," Resch says, "this is not merely an exercise in driveling nostalgia, but the introduction of a theme that runs through the Romantic movement." It is sophisticated show-and-tell because of the intellectual, humanistic context and because of the elevated patterns for introspective thought provided by the literature. However, Resch reminds us, his method can't be replicated as an academic exercise. The teacher must be an honest romantic too: "our leading must come from within ourselves." (F.S.)

CHARACTERIZING OURSELVES

"Character and Characterization in Religious Autobiography" by John D. Barbour in Journal of the American Academy of Religion LV, 2 (Summer 1987) 307-327.
Scholar's Press, Box 1608
Decatur GA $50/year. 4/year.

When we have our students read autobiography as an expression of the self, we must ask to what extent is the person we encounter in the autobiography the real self. John D. Barbour, an Assistant Professor of Religion at St. Olaf College, reminds us that "Recent criticism challenges the notion that the character created in a text corresponds directly to the writer's historical self, because the writer can use language as a tool directly to express himself."

Do we dismiss autogiography as just another fiction? Do we assume the act of autobiographical representation is impossible because self lies below the surface of consciousness? No, argues Barbour, instead, we must attend to both characterization and character in the reading or writing of autobiography. The autobiographer characterizes his or her past self through descriptions of feelings, settings, events, beliefs, dreams, etc. Although the characterization may not be accurate as historical fact, the metaphors of self the author uses can reveal character. Furthermore, character, what Barbour calls "the moral condition of the writer," is what has set the limits on the writer's imagination of characterization.

The dynamic interplay between character and characterization is at the heart of all great autobiographies, like The Autobiography of Malcolm X, which Barbour analyzes from this perspective. As Barbour concludes, "The autobiographer must be concerned with character assessment, or we sense a kind of frivolousness and an evasion of a central aspect of self-knowledge. But the autobiographer who cannot see his self-portrayal as partly a matter of characterization ... seems to lack insight into his own activity as a knower and writer of the self.... To be fully convincing, narratives of the self seem to need both a concern for character and a self-reflexive understanding of the activity of characterization."

If we can teach our students to appreciate the interaction of these two qualities in the autobiographies they read, they will have a richer appreciation of autobiography as an expression of self. (S.C.-M.)

1989 NAHE CONFERENCE

The next issue of HumaNews will have information about the NAHE National Conference in Kansas City. Mark your calendars now! April 20, 21, 22, 1989.

NAHE MEMBERSHIP

Why not share membership information with your colleagues in your college or university, elementary or secondary school, state humanities council, historical society or museum? Many of them are looking for just such an organization as NAHE. Copy the NAHE application form and pass it on to them.

NAHE MEMBERSHIP APPLICATION

Your name ______________________________

Your address ______________________________

____

____

Checks for $16 should be payable to **NAHE**

Prepaid individual membership and institutional subscriptions are $16/year. (If you require invoicing or special billing, the rate is $20.) Your payment will be acknowledged, notifying you when to expect your first issue of **HUMANITIES EDUCATION**. We are able to maintain the low $16 membership by printing only as many copies as there are paid memberships, so it is important to join now! Mail this form and your check to:

HUMANITIES EDUCATION
c/o Dept. of Philosophy/Humanities
University of Minnesota, Duluth
Duluth, MN 55812-2496

PAPERS, CONFERENCES, POSITIONS, ETC.

Fellowship Deadlines:

October 15
Humanities. Applications for 1989-90 post doctoral fellowships for resident study in humanities. Contact: Kent Mullikin, Ass't Director, National Humanities Center, 7 Alexander Drive, P.O. Box 12256, Research Triangle Park, NC 27709-2256.

October 15
Humanities. Application for short term resident fellowships for research in humanities. Contact: Committee on Awards, Newberry Library, 60 West Walton Street, Chicago Il 60610.

Grant Deadlines:

October 15

Chinese Studies. Applications for advanced study in China during 1989-90 academic year. Contact: Committee on Scholarly Communication with People's Republic of China, National Academy of Sciences, 2101 Constitution Avenue, Washington, DC 20418: (202) 334-2718.

Prize Deadline:

October
Manuscripts in the humanities for consideration for the Norman L. and Roselea J. Goldberg prize. Contact: Director, Vanderbilt University Press, 1211 18th Avenue South, Nashville, TN 37212.

Positions:

Medicine/Humanities. Position available beginning July 1989. Applications due December 1. For more information contact: Search Committee, c/o Loretta Kopelman, Department of Medical Humanities, School of Medicine, East Carolina University, Greenville, NC 27858-4354.

Museum Administration. University of Alaska, Fairbanks. Minimum qualifications: Ph.D. Research accomplishments in the field of natural history, five years in museum administration as a curator and/or director. For more information contact: David F. Murray, Chair, Search Committee, University of Alaska Museums, Fairbanks 99775-1200; (907) 474-7108. Deadline for application, October 31.

1043

Museum Administrator. For complete job description and application forms contact: Director of Personnel, Texas A & I University, Kingsville, TX 78363; (512) 595-3705, or Connor Museum (515) 595-2819.

Women's Studies: Tenure track position. Candidates from any discipline considered. Beginning January 89 or August 89. Send vitae, references, and sample syllabi by October 15, 1988 for full consideration. Contact: Dr. Susan Arpad, Women's Studies, California State University, Fresno, CA 93740-0078.

Journal News:

HERITAGE EDUCATION QUARTERLY celebrates one year in print. The journal is a national publication for teachers, planners, preservationists, educators, museums, and civic groups who lead community heritage projects. It describes programs for children and adults, and spotlights leaders in the heritage education field. HEQ provides case studies and lesson plans that have been field tested. Annual subscription, $12. Contact: HEQ, 498 South Main Street, Madison, GA, 30650; (404) 342-0770.

Conferences:

October 20-23
The Association for Integrative Studies Conference will be held at University of Texas, Arlington. Theme: The Interdisciplinary Humanities: Social, Scientific, and Artistic Concepts. Inquiries: Laurie Jacobs, UT, Arlington; (817) 794-5015.

October 13-15
The Association for General and Liberal Studies will be held at Wilkes College in Wilkes-Barre, Pennsylvania. The organization is interdisciplinary in nature and the conference theme is "Liberal Learning in a Post-Industrial Culture." For conference information contact: Robert J. Heaman, Academic Affairs, Wilkes College, Wilkes-Barre, PA 18766: (717) 824 4651, Ext. 4204.

November 5-6
Character and Competence: A Promise for Survival/ An Interdisciplinary Conference from the Perspectives of Education, Psychology, Anthropology, Philosophy, and Sociology. For program information call (213) 825-4191. For application write: P.0. Box 24901, Department K, UCLA Extension, Los Angeles, CA 90025-0901.

March 1989
The Popular Culture Association/American Culture Association Meeting will be held in St. Louis, Missouri on March 22-27. Write to Ms. Pat Browne, Popular Culture, Bowling Green State University, Bowling Green, OH 43403 for general information.

1044

Conferences and Paper Proposals:

October 15
Women's Studies. Proposals for possible presentation at the annual meeting of the Southeastern Women's Studies Association to be held in February 89 in Atlanta. Contact Elizabeth Fox-Genovese, Emory Institute for Women's Studies, 210 Physics Bldg., Atlanta 30322; (404) 727-0096.

March 89
The Gulf Coast History and Humanities Conference will meet in Mobile, Alabama March 9-11. Theme: "The Maritime History of the Gulf Coast." For more informationcontact: Dr. George Daniels or Dr. Michael Thomason, History Department, Mobile, AL 36688; (205) 460-6210.

The Grapes of Wrath, 1939-1989: An Interdisciplinary Forum will be held on March 16-18 at San Jose State University. Papers are invited on the novel and the 1930's, the novel in its historical, artistic, and political contexts. Papers on California migrant labor in the 1980's also welcome. **Submit papers by December 30, 1988** to: Dr. Susan Shillinglaw, Steinbeck Research Center, San Jose State University, San Jose, CA 95192-0028. Keynote Speaker: Leslie Fiedler.

February 89
The Southern Humanities Conference will be held in Macon, Georgia on February 16-18. The conference will focus America's continuing experiment in constitutional government, democratic pluralism, cultural innovation, and opportunities for new visions of human liberation. Proposal should include curriculum vitae as well as descriptive title and one-page summary of the paper or session. Submit proposals by November 1, 1988 to: Dr. Gary Richardson, Department of English, Mercer University, 1400 Coleman Avenue, Macon, GA 31207. For conference information call (912) 741-2357, or write SHC, Department of Interdisciplinary Studies, Mercer University, 1400 Coleman Avenue, Macon, GA 31207.

Announcement from the NAHE Board of Directors

After Kansas City: Where?

NAHE hopes to be able to announce the site for our 1991 national meeting at the meeting in Kansas City. We need suggestions, especially backed up by a commitment to act as local chair. Potentially we could convene anywhere in the world, but the Board insists on sites that are easily accessible, reasonably economical and have good potential for adjunct cultural activities.

Meetings must be self-supporting through registration fees and grants. Administration can usually be arranged by university continuing education/conference bureau. (Our 1987 convention was in St. Paul, 1989 will be in Kansas City.)

Write or call President Fred Schroeder if you have a site to nominate. (218-726-8237)

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity, humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

TEACHING GENESIS AND EXODUS AS OLD TESTAMENT AND HEBREW SCRIPTURE

I. Bringing back the Bible

A movement to return classic texts to our classroom has gained new support from both liberal and conservative pedagogues. Whether theorists speak of the need for a shared cultural inheritance or the need to learn and evaluate the texts of power, a consensus is emerging that students must be able to enter into dialogue with those works of Western literature that have shaped the received canon. The opening books of the Bible have a certain primacy in that canon, treating the creation of our world and laying the foundations for Judaism, Christianity, and Islam. However, our students approach these books with a maximum of pre-understanding and a minimum of actual experience. They have heard of each of the characters they will meet, and they have formed clear impressions of these characters, yet few students will have actually read more than scattered verses taken out of context. These works thus present special problems for the teacher of Western Humanities courses, problems which require a number of decisions about teaching methods particular to the teaching of the Bible among the great books.

The Old Testament taken as a whole has a triply unique position in Humanities curricula: 1. It is the only work we treat out of historical context. 2. It is the only work we do not teach under its own name. 3. It is the only work from which we fail to select those portions that were central to the redactor's intention, preferring instead to read selections that were of central importance to one strand of the later Western tradition, namely, the Pauline Christian.

First, we read the Old Testament out of historical sequence. The reading that I will consider here consists largely of eighth-century b.c.e. traditions which were redacted in the mid-fifth century. Thus, heroic stories contemporary with Homer, which were edited by priests who lived during the Golden Age of Athens, are usually presented to our students as part of the transition between the classical world and Christian culture.

Second, we do not study the "Old Testament" under its own name, thereby reenforcing the impression that our detour into Hebraic culture is intended only as background for something else -- that something being, of course, the New Testament. While it may be argued that surveys of Western literature are, quite intentionally, forward looking -- teaching us all one needs to know to read, for example, Joyce's Ulysses, many instructors have increasingly attempted to discuss each work on the syllabus first on its own terms and against its own background, and then secondarily as part of the Western tradition. That, it seems to me, is a logical sequence, and one that will best serve us whatever our larger agenda happens to be. By beginning the semester with the study of the Old Testament, rather than, for example, the Hebrew Bible or Hebrew Scriptures--somewhat less weighted designations -- we send a powerful message of theological as well as academic importance.

Finally, the choice of selections further testifies to our essential discomfort with this text. When we condense Don Quixote, we seek to follow the main story line, editing out the text's numerous disgressions and smaller, self-contained episodes. Similarly, our choices from Montaigne reflect a desire to include essays that capture his range, method, and most insightful pieces. Our Old Testament selections: the story of Creation, Sinai, Job, and Isaiah, purposefully avoid what is central to the Hebrew Bible taken on its own terms in favor of what is central to the New Testament's reading of the Old. We stop at precisely the point where the Bible wants us to begin: the law and the history of the relationship between Israel and the law. The stories of creation and the slavery of the Israelites in Egypt are presented in the first five books as a necessary prologue to the law, a prologue that establishes God's dominion and his special relationship with Israel.

Implicitly, by our choice, we are preparing our students to understand Romans 4:15, "For the law brings wrath, but where there is no law there is no transgression," but not Matthew 5:18, "till heaven and earth pass away, not an iota, not a dot, will pass from the law until all is accomplished."*

In approaching the biblical text in this way, we are, of course, standing within the main lines of the Western Christian tradition, for that tradition is Pauline. I hope to show that while we are faithfully representing one strand of the tradition's appropriation of the Old Testament, we are excluding other, equally important readings.

My essay accordingly moves along two trajectories. First, treating the Old Testament as a link in the Western tradition, I present a reading which focuses on the position of women in the text, tracing the Bible's attempt to control what it perceives as woman's threatening sexuality, as that tradition develops from the Matriarchs to the Virgin Mary. I then re-trace my steps and give an alternative reading of the same traditions that attends to the motif of the younger son supplanting the elder. My emphasis here will be to explain why these traditions were found meaningful by that generation of Israelites which preserved and reacted to them.

I conclude with a few words on that part of the Bible which we, following our Pauline forebearers, have put under erasure--Old Testament law. I attempt to briefly show that for those who canonized the Bible, the legal passages presented not a conservative, formal, ritualistic way of life, but rather a profound theological statement about the possibility of creating order in a world of chaos.

II Defamiliarizing the Biblical Heroine

If our task as teachers of Humanities is to introduce students to the unfamiliar, it is also to defamiliarize texts that they know all too well. If this rule applies to any work in the curriculum it certainly applies to the Bible. In reading Genesis and Exodus most of our students are on familiar ground, rereading stories that they have either read or heard before and which have influenced such a high percentage of everything else they have been exposed to in our culture.

---

*Our choice of editions is also critical. To demonstrate the independence of the Hebrew Bible would require the purchase of two separate Bibles each containing one Testament. Such a gesture would be not only impractical but also inappropriate to a course that attempts to illustrate how each text was understood by later writers. Still, a modern scholarly edition that points out the meaning of Old Testament packages in their own contexts (such as the New English Bible or the Oxford Annotated Bible) is preferable to the King James version.

The position of women in the text thus becomes a fruitful starting point for fresh examination. The issues raised by a close reading of the presentation of the mothers and lovers of the Old Testament lead to important questions about the role of the Bible in shaping both literary conventions and social norms in the later tradition. I would even argue that this is, in fact, uniquely suited to such a task.

A feminist reading also commends itself because the Bible has recently been the subject of a wide range of apologetic and harshly critical reappraisal, among literary critics both feminist and non-feminist. For this purpose, a single quote from Robert Alter's The Art of Biblical Narrative suffices:

> Biblical narrative...includes a remarkable gallery of women--Rebekah, Tamar, Deborah, Ruth--who are not content with a vegetative existence in the corner of the house but, when thwarted by the male world or when they find it lacking in moral insight or practical initiative, do not hesitate to take their destiny or the nation's into their own hands. (p. 146)

Alter's "remarkable gallery of women" includes a woman who tricks her blind husband, a woman disguised as a prostitute who seduces her father-in-law, a woman judge whose sole act in the Bible is to shame the Israelite general into action, and a noble convert who seduces her late husband's cousin into marriage. In other words, by attempting to treat the female characters in the Bible as ideals who succeed in conventionally male roles, Alter and other apologist literary critics and Bible scholars unwittingly defeat their own purpose of making the Bible inoffensive to feminist sensibilities. Each of these women acts only within one of two narrowly circumscribed roles--that of mother and that of lover. In either case, female power in the Bible is sexual power, and each of the Bible's heroines accomplishes her ends (whether military, political or domestic) in the private space of the bedroom. (See Lefkovitz, "When Lilith Becomes a Heroine.")

It has long been observed that the mothers of the Bible commonly share the trait of barrenness. That is, the favored wife is unable to conceive a child until late in life (in the case of Sarah) or until long after her rival has produced offspring (for example, Rachel or Hannah--Samuel's mother). Other mothers who follow this pattern include Rebekah and Samson's nameless mother. In all of the cases of a loved barren wife, God intervenes to remove the curse of barrenness, and a miraculous birth follows. As Lefkovitz has explained, the special child will be a hero and will hold a unique place in the history of Israel's redemption as God removes barrenness and enters into a pact with the mother of the hero. But mother must consecrate the son into the service of God. Isaac will be put on the altar as a sacrifice, Jacob will leave home to flee Esau, Joseph goes into Egypt, Samson becomes a Nazirite, and Samuel a prophet in God's temple.

What does this repeated motif tell us about the construction of women in the text? The text reasserts the Divine prerogative to create whenever heroes have birth stories, first by insisting that man alone is insufficient to impregnate the mother of the hero and second, by depriving the female of her full creative powers, allowing her to be the receptacle of such remarkable seed only if she renounces claim to its issue, affirming her willingness to give the son to God by allowing him to leave her.

The other female model provided by the Bible is that of the lover who, like her maternal counterpart, uses her sexual power to shape Israel's future. In this list we find such women as Tamar, Delilah, Jael, Esther and from the Apocrypha, Judith. In four of these instances, the woman uses her power in the bedroom to entrap and kill her opponent. Tamar's desires require less drastic fulfillment.

The case of Deborah, which seems to be an exception to this thesis, is instructive. We are told in Judges 4 that Deborah was a Judge. And while we are told nothing of her activity as a judge, we are told how she shamed the Israelite general Barak into attacking the enemy Sisera by stating that since he has hesitated and insisted that she join him in battle, Barak will not kill the enemy but rather "the Lord will sell Sisera into the hand of a woman." Seeking to escape his fate, Sisera enters Jael's tent and in a surprise for both Sisera and the reader, instead of providing him with shelter, she kills him, driving a tent peg into his head. Woman as political leader takes no action; woman as military savior performs her acts of bravery in the bedroom (Lefkovitz, The Character of Beauty, pp. 67-74).

Where does this tradition lead? The stories of that great oxymoron the "barren mother" lead to the extreme case of the virgin mother Mary, where the husband is totally removed from the picture and where the son is taken from his family in the most extreme form imaginable. Unlike Isaac, Jesus is sacrificed, and before his death and resurrection, he publicly renounces his family connection to Mary. But as Mary's story marks the culmination of the biblical matriarchal tradition, her lack of sexuality (she is a virgin, and she has no role in the machinations surrounding her son's future) mark the creation of a new dichotomy. No longer are women mothers or lovers but they are now conceived of more specifically as virgins and whores, Mary and Mary Magdalene, Whore of Babylon and Ecclesia, and later still, Synagogue and Ecclesia. Two types of women are envisioned, the spiritual, ethereal, pale Christian beauty and the sensual, tempting, lustful, exotic, dark Hebrew beauty. The development of these two types can be traced throughout later literature.

III The Code of the Younger Son

The Bible's birth stories tell a second tale as well. We can focus our students' attention not on mothers but on sons, and in so doing we might notice a motif that is as powerful and as oft-repeated as that of the barren wife, that of the ascendance of the younger son over the elder. The ancient Near East world adhered to the principle of primogeniture--the eldest son inherited the father's estate. The Bible, in the stories of Abel, Abraham, Perez, Isaac, Jacob, Joseph, Ephraim, Moses, and David, reverses that principle, establishing a contrast between the eldest son and the son of the promise, the favored son who will come to preserve the true line. A series of dramatic contrasts is announced and reenforced. The young Isaac is quiet and pastoral; Ishmael becomes an expert marksman. Jacob stays at home, while Esau hunts. The young dreamer Joseph must overcome the hatred of his older, more aggressive brothers. The Israelite hero is the younger and weaker child who is able to overcome opposition by fathers and brothers to achieve his rightful place.

A special case of this motif is found in the story of Moses' birth and early life, a story told in a scant 10 verses, Exodus 2:1-10:

> Now a man from the house of Levi went and took to wife a daughter of Levi. The woman conceived and bore a son; and when she saw that he was a goodly child, she hid him three months. And when she could hide him no longer she took for him a basket made of bulrushes and daubed it with bitumen and pitch, and she put the child in it and placed it among the reeds at the river's brink. And his sister stood at a distance, to know what would be done to him. Now a daughter of Pharoah came down to bathe at the river, and her maidens walked beside the river; she saw the basket among the reeds and sent a maid to fetch it. When she opened it she saw the child; and lo, the babe was crying. She took pity on him and said,

> "This is one of the Hebrew's children."... And the child grew, and...Pharaoh's daughter named him Moses for she said, "Because I drew him out of the water."

Verse eleven begins: "And it came to pass in those days when Moses was grown up...."

The birth story serves as a brief prologue to the real Moses story: Moses, the leader of the Israelites, Moses, the lawgiver. Our suspicion that the birth story represents a later addition to the main epic is confirmed by a review of the numerous close parallels to Moses' birth found in the literature of the ancient world. The most striking is the Akkadian story of Sargon:

> Sargon, the mighty king, king of Agade, am I. My mother was a high priestess, my father I knew not...My priestly mother conceived me, in secret she bore me. She set me in a basket of rushes, with bitumen she sealed my lid. She cast me into the river which rose not over me. The river bore me up and carried me to Akki, the drawer of water. Akki, the drawer of water, lifted me out as he dipped his ewer, Akki, the drawer of water, took me as his son and reared me. (The Torah, p. 392)

The parallels direct our attention to the three main features shared by the two accounts. (1) Doubtful, but upper class parentage. We are not told the names of Moses' parents, but the story takes pains to repeat twice that they were of the blessed tribe of Levi. In Sargon's story we are told that his mother was a priest, though his paternity is left unclear.

(2) Danger attends the child's birth. Moses' life is, of course, threatened by Pharoah. Like Sargon, his mother saves him by hiding the child in a basket and floating him downriver. (3) Divine providence returns the child to safety. Divine protection is demonstrated by the endangered child's rescue by a member of the royal court.

Those familiar with Lord Raglan's study, The Hero will no doubt recognize these three motifs as part of the code by which our culture identifies its heroes. Our tradition's heroes are not heroic on the basis of their human accomplishments alone. Rather, they are by nature heroes, and for the authors of these stories, nature is identical with God. Moses, descendant of the house of Levi, is born at a critical moment in Israelite history to end the dark period of slavery. From the start his life is forfeit; all males are being put to death. Like the other Biblical heroes mentioned earlier, the future leader must leave his natural parents to be claimed by God to serve God's ends. Moses, by birth--by nature--the Israelite leader, becomes, most inappropriately, a foundling in the home of the Israelite's arch-enemy, Pharoah. Through still further fortuitous circumstances--that is, through divine intervention, Moses' nature triumphs over his circumstances. He will leave the royal court to assume his true royal title--as leader of his people. Those who rule are those set apart by God, taken from their families to serve as God's chosen agents.

Within the story of Moses' birth we thus see the beginnings of the process of exegesis on the life of Moses the lawgiver and desert leader. By adapting a folk-motif found in ancient Near East literature and placing it in the context of the Bible's other stories of children lost and found, Moses is identified as a hero, and we are once again made aware that nature's choices equal God's choices. Those who rule were intended to rule.

The foundling in literature--from Oedipus through Perdita, Joseph Andrews and Heathcliff--the hero or heroine fated to live, the misplaced person, has changed to reflect the differing assumptions of different ages. Oedipus and Moses must fulfill their destinies because the gods or God control history; in the realist novel, nurture assumes priority over nature and we discover that we are all foundlings in democratic societies, destined to find and make ourselves.

Why did this story speak to the Israelite community that preserved and canonized it? First we must identify that community. While the standard literature or humanities course presents the Old Testament as a product of the first century c.e., the historical books (Genesis-Kings) and much of the prophetic canon took its present shape some 500 years earlier as part of the response to the destruction of the Northern Kingdom in 722 b.c.e. and to the destruction of the First Temple and the Kingdom of Judah in 586 b.c.e. The Bible was first promulgated among the Israelites only following the return from the Babylonian exile in the 5th century, and it is against this background that one can attempt to understand the motif of anti-primogeniture.

The Israelites were returning to the land of Israel after a traumatic series of events that challenged the essence of their religious faith. The first commonwealth was destroyed, many of the people killed, and the remnant driven into exile. Most significantly, the holy city, which was thought to be inviolate, was profaned, and God's dwelling place, the Temple, was destroyed. According to the prevailing view, such events could indicate only one of two things: either God had broken his bond with the Israelites or He had been defeated by superior forces. In the face of these alternatives two new options were added. First, the formerly discarded prophecies of Jeremiah and other pre-exilic anti-government prophets were recalled. These individuals, functioning outside of the guilds of professional prophets which surrounded the courts, had predicted both the destruction of Jerusalem and its restoration, linking the former to the sins of the people and the latter to their repentance. Second, they turned to the same pro-exilic traditions concerning the collective ancestors of the Israelite tribes that seemed to have a uniquely contemporary message: things are not what they seem. There is a gap between appearance (Israel's lowly status among the nations) and reality (Israel's true position as the bearer of divine promise). In this light we can understand, for example, the truncated story found in Genesis 48. By right, Joseph's son Manasseh, who is the firstborn, deserves priority in receiving his grandfather's blessing. And such is clearly the wish of his father. Yet Jacob purposefully places his right hand on the head of Ephraim, which entails self-consciously crossing his hands, since Joseph had placed the two boys in front of him so that Jacob's right hand would have naturally fallen on the head of Manasseh. By the time of this story, the reversal of fortunes had become an accepted literary *topos* which no longer needed to be explained.

Placed against the background of the Babylonian exile, the traditions concerning the triumph of the younger, weaker son yield a special set of meanings which found expression in Psalm 118, "the stone which the builders rejected is become the chief corner-stone." Appearances are not everything: the rejected are in fact the chosen.

IV The Competing Discourse of Priest and Prophet

The Biblical response to the events of 722/586 b.c.e. took another, non-narrative form as well, namely Old Testament law. The western tradition looks at biblical law in the way the New Testament describes it. For Paul, the law is spiritually and morally dangerous, and the path to salvation is therefore not through law but rather through faith. Furthermore, as the continuators of priestly legalism, Matthew portrays the Pharisees as hypocritical formalists who lack compassion and moral concern.

The biblical tradition, however, has never seen itself that way. Psalm 19 presents the accepted view:

> The law of the Lord is perfect, reviving the soul...the precepts of the Lord are right, rejoicing the heart.

From the biblical perspective, law, and more specifically legal discourse, can be the vehicle for expressing morality and conveying theological ideas. Specifically, the same desire to understand a chaotic world and Israel's place in it that motivates the anti-primogeniture motif may be seen to underlie the priestly legal system that forms the Old Testament's centerpiece.

As I alluded to earlier, Genesis 1-Exodus 20 may be seen as a prologue to the priestly legal code, a code which begins with the priestly account of creation in Genesis I and then continues through the last half of Exodus, Leviticus, and Numbers. The God who commands is the God who created the world and who in the words of Exodus 20:2 (the first commandment) brought Israel out of Egypt, the house of bondage. One thread runs through this material--the desire to create order in the universe. God creates the world through a series of differentiation. Light from Darkness, Heaven from Earth, Land from Sea, the great chain of being culminating in the creation of man and woman. Each type of creation is brought forth in order of ascending importance, with (among living things) plant life appearing first, then animal life and finally humanity. All living things, furthermore, were created each according to its kind. Creation is thus an act of ordering, the purpose of which is to make the world perfect and thus prepare it to be made holy. Leviticus 19 consists of a list of rules headed by the command, "You shall be holy, for I the Lord your God am holy." Priestly law teaches the connection between order and the ability to receive the divine presence; order creates the precondition for holiness. The priestly legal code therefore insists upon rigid differentiation between types of produce which may not be sown together, animals which may not be yoked together, foods which may and may not be eaten, an economy of purity which may not be disturbed.

Mary Douglas, in Purity and Danger attempts to understand the dietary rules of Leviticus 11 in this context. She rejects earlier attempts to interpret the rules on the basis of their ethical content, educational value, foreign influences, allegorical significance or irrationality. Instead, she would direct our attention to seeing Israelite purity rules as the dominant symbol of the community's social life. If the Israelite on earth keeps the pure and the unclean distinct, this act of ordering will be maintained by God's reciprocal actions. If we permit chaos on earth, then God will withdraw the blessings of order.

Specifically, this means that the dietary rules create a taxonomy of animal life which differentiates between things that swim (defined by fins and scales), land animals (defined by split hooves and the chewing of cud), and things that fly. The pig is especially forbidden because it straddles the boundary, having one trait of clean land animals and one of the unclean. Lobsters as sea animals that walk also violate a boundary and become the objects of special prohibition.

Why did this system come to exert a hold on the Israelite people and become so large a part of their main literary statement--the first five books of the Bible? We can find the answer by, as I suggested at the outset, looking to the period during which these laws were promulgated. The priestly code, which might seem to be the product of obsessive compulsives living a tightly ordered life, is, in fact, the product of a period of disorder--of boundaries violated and sancta profaned. The divisions between the land of Israel and the gentile world, between Jerusalem and the rest of Israel, between the Temple precincts and the city had all been violated and the priests sought to create an idealized system of original divine order to compensate for their profound experience of disorder. Perhaps, they felt, if we can create a world of order in language and later attempt to replicate it on earth, we will never have to suffer destruction and exile again. We will maintain our part of the bargain, and God will fulfill His in preserving the distinctions set up when the world was so carefully created. Biblical law then is a form of theodicy, and it functions in the historical narratives as the touchstone by which to judge the behavior of the people and God's response.

If, in fact, the priestly system presents laws of such rich meaning and religious/social significance how are we to understand the prophetic invective against the priestly cult? How should we interpret Isaiah's cry against the people:

> Is this the fast that I have chosen? Is this affliction of the soul? Is it to droop your head like a bulrush, to grovel in sackcloth and ashes?...This is my chosen fast: to loosen all the bonds that bind men unfairly, to let the oppressed go free, to break every yoke. (Isaiah 57:5-6)

In order to understand the underlying differences between these two religious systems that underlie so much of biblical law and narrative, I offer the following set of contrasts.

The priestly system is one of divinely established differentiation in which it is humanity's role to maintain an established order. For the prophet, humankind awaits God's return to history to reestablish His rule. We await a golden age at history's culmination.

The priest assumes human sin and backsliding and provides a cultic system to allow people to live with the reality of sin and move on, in the certainty that they will fail again but that a method of atonement is available. In the prophetic system, morality is absolute and the sinner must turn from sin and repent for all time.

In the temple, the individual addresses God, asking for forgiveness in exchange for an offering. In the house of the prophet, God addresses humanity, making his demands and offering absolute obedience as humanity's only salvation.

This distinction between priestly and prophetic religion may seem to be a foreshadowing, a type, if you will, of the later division between Jesus' teaching and that of the Pharisees. In many respects the parallel holds. First, pharisaic religion, with its concern for the creation of purity and order, also emerged in response to disaster--in this case the calamities of 70 c.e., the destruction of Jerusalem and the second Temple by Rome. More significantly, the gospel of Matthew, like earlier prophetic writings, while critical of commonly accepted religious practice, maintains its links to the legal system. Thus, Matthew is unique among the gospels for its extensive Old Testament prooftexting. Furthermore, Krister Stendahl in The School of St. Matthew has argued that the Gospel is divided into five divisions each marked by a unit of narrative + a unit of discourse, corresponding to the five divisions of the torah, the five books of Moses. The Sermon on the Mount thus comes in place of the revelation on Mt. Sinai both structurally and thematically (p. 25). Finally, in Matthew, Jesus takes pains to place his observance within rabbinic/pharisaic norms. Unlike Paul, the Jesus of Matthew has made no break with the law.

V Naming the Bible

I end where I began, with the question: Old Testament or Hebrew Scriptures? Many Humanities curricula aim to establish a tradition, to show our students relationships among texts. At the same time, we respect the integrity of the works we teach, trying to historicize, and to first situate the individual work in its own immediate setting. Hebrew Scriptures poses particular problems.

First, the "Bible as Literature" presupposes that it is more usual to consider the Bible as something else. The secular university has inherited this book--Old and New Testaments bound together in one volume--from people and places that approached it from Christian perspectives. The Old Testament prefigures the New, and that is its primary purpose.

Second, the Bible is not literature in the same way that Joyce's or even Homer's Ulysses is. As a bound work that--like other literary texts, makes coherent the chaos of the world--the Bible differs insofar as it is more like a library that contains prose narrative, poetry, and law than a single work. Questions of dating, redacting and canonization are not answered simply. How we teach Hebrew Scriptures, what we call Hebrew Scriptures, even more importantly, when we teach Hebrew Scriptures, are all political choices.

In one way or another, literary critics have addressed themselves to these problems. Writing on the eve of the second world war in Germany, Erich Auerbach's Mimesis finds the stories in Genesis more effective as literature than Homeric narratives. Writing in the same tradition, Robert Alter in The Art of Biblical Narrative treats Hebrew Scriptures as if they were a single coherent text not unlike Ulysses. I commend Alter's book for its analysis of biblical literary conventions, but I caution that Hebrew Scriptures are not a modern novel, though Alter cleverly finds it anticipating the best of literary devices. Operating from different premises, Northrop Frye, in The Great Code, sees the Old and New Testaments as a single source for the Western Tradition's assumptions.

Depending upon which choice we make, Hebrew Scriptures or Old Testament, we will emphasize different parts of the text and find therein different virtues--literary and thematic. I would only urge that when we situate Hebrew Scriptures in its own context, and the Old Testament in the context of the tradition, that we be sensitive to the fact that Hebrew Scriptures and Old Testament are not the same work.

RETURNING TO THE LAND

In Trout Fishing in America, Richard Brautigan writes of a doctor who "was leaving for America, often only a place in the mind." That America--both a physical place and a mental construct shaped and colored differently by each generation--makes an excellent subject for humanistic interdisciplinary study.

Courses in American landscape were fashionable at the height of the ecology movement in the 1970's but they practically disappeared when student concerns shifted from saving the earth to saving one's economic posterior as morning dawned in Reagan's America. (The lack of current interest is indicated by the fact that Oxford University Press has let go out of print John Conron's anthology The American Landscape, originally published in 1973 and available until last year.) Landscape courses should be considered again, however, for the contributions they can make to humanities education:

- Such courses can become a substantial introduction to the humanities by themselves. They offer vocabularies and methodologies for a number of disciplines, while providing humanistic perspectives on a specific valuable area of content.
- They can gather students with various majors and interests who present different viewpoints on a topic of common concern. (I feared that my landscape course last year might appeal only to latter-day Miniver Cheevies born too late for the Age of Aquarius; the course actually enrolled students from most of the university's colleges and from a wide variety of majors.) Thus, courses in landscape can facilitate what Thoreau identifies as of greatest value in education: the opportunity to associate with the most cultivated of one's contemporaries.
- Such courses also offer instructors new areas to explore and opportunities to continue their own education in the humanities. (After working for years on a rather narrow specialty, I wanted to break away from strictly literary studies, expand my own perspectives, read in other disciplines: history, geology, geography, art, ecology, psychology of perception, etc. I suspect that English teachers, many of whom read all day, are among the least widely read of all educated people. Before tenure, if I was not going to teach something or publish research about it, I could not justify reading it.)

I taught a course on the American landscape twice on the college level, although it should work perfectly well, too, in secondary schools. The course was listed under the rubric of "special topics," but I am now working it up as an American Studies offering to be scheduled regularly. Landscape courses might focus, certainly, on locales other than America--Ireland comes immediately to mind because of William Trevor's delightful A Writer's Ireland: Landscape in Literature.

The goal of the course, as of all my undergraduate offerings, is to make the students better readers and viewers--to get them to read texts and explore visual objects actively, carefully, imaginatively, creatively. More specifically, the course should teach students to perceive landscape intelligently--to render conscious and to analyze the values and preconceptions that affect how we view the land. The course is also an exercise in cultural perspectivism: we try to see the land from the viewpoints of earlier generations of Americans, noting how their religious-philosophical-social-economic-aesthetic concerns affect their perceptions. We also test our own attitudes and perceptions against those of other times and other cultures. In surveying views of the land from the early explorers to the present, we explore such subtopics as the new Eden and wilderness, the frontier, the sublime and picturesque, the industrial transformation, and the urban waste land.

Texts for landscape courses are plentiful and varied, even though Conron's The American Landscape is out of print. This anthology still offers ideas for reading selections and Conron's chapter introductions are valuable, but the book has become seriously outdated. Instructors of landscape courses today will probably want to use recent research by Barbara Novak, Annette Kolodny, Susan Griffin and others to supplement the predominantly white male writers and artists anthologized by Conron. I plan to teach a number of cheap paperback primary works (e.g., Of Plymouth Plantation, Walden, Pilgrim at Tinker Creek) supplemented by xerox copies of excerpts from earlier works no longer protected by copyright. I will also place on library reserve a large collection of primary and secondary works for students to use depending on their particular pursuits. Thus, we will work with both a core of texts read in common for class discussions and a wealth of materials that students can explore on their own according to their individual needs and interests.

Visual landscape resources are also easily obtained. Art departments and learning resource centers at most colleges can provide slides of paintings, drawings, and photographs. Slides can be made fairly easily from illustrations in library books, too; I have accumulated a substantial collection of landscape slides with the investment of not much time or personal expense.

Films offer another visual resource widely and conveniently available, either from the collection of one's own institution or from public libraries or even local video-rental shops. I have used, whole or in excerpts, such films as Shane (1953), Occurrence at Owl Creek Bridge (1962), Days of Heaven (1978), and Koyaanisqatsi (1983). Most video stores will rent for a couple of dollars such appropriate works as Easy Rider (1969), Deliverance (1972), Bad Land (1973), The River (1984), Places in the Heart (1984), and Country (1984). In addition, the National Gallery of Art lends for free such helpful visual materials as The European View of America (slides and cassette) and The American Vision (videocassette). The Minnesota Department of Natural Resources (and perhaps other state DNRs) makes available at no cost a wide variety of useful visual materials.

Local museums and galleries provide another valuable agency for the study of landscape; most will have at least a few American landscapes for students to explore. I am unusually fortunate at the University of Minnesota-Duluth to have the Tweed Museum on campus with a permanent collection that features a number of superb (especially 19th-century) American landscapes. When I taught "The American Landscape" in Spring 1987 the Tweed hosted two especially relevant special exhibits: "Aaron Bohrod: Paintings, Drawings and Graphics, 1932-1985" and a marvelous collection put together by then UMD photographer Gretchen Garner entitled "Reclaiming Paradise: American Women Photograph the Land." Ms.

Garner was gracious enough to conduct a special tour for our class.

Assignments for the course consisted of readings, discussions of texts and visual resources, and writing projects. The latter included a short essay in which each student described, analyzed, and responded to one American landscape in a local museum or gallery. This assignment was designed to familiarize class members with local collections, to have them experience actual works of art instead of just reproductions in books or slides shown in class, and to get them to use the critical vocabulary and conceptual tools they were learning. Students also completed a major project based on their individual interests and goals for the course. In consultation with the instructor, they selected both the subject and format of their presentation. Projects ranged from fairly standard term papers ("Georgia O'Keeffe's American Desert", "Willa Cather's Midwest") to more unusual and imaginative (interviews with local landscape architects to get a sense of their attitude toward the land as affected by economic concerns; a survey of Upper Midwestern Indian myths concerning nature; a slide show about life on a farm in northern Minnesota; original landscape paintings illustrating an original short story). Students reported on their projects regularly throughout the course to demonstrate satisfactory progress and to solicit advice from their classmates.

The course was structured chronologically according to the order of Conron's chapters. Our goal was to determine how past generations of Americans viewed the land and what cultural elements influenced their perceptions. We began in the present with a common and immediately recognizable motif: modern America as a waste land or ecological hell. Readings from Brautigan, Mailer, Rachel Carson and Aldo Leopold supplemented slides of paintings by Charles Burchfield and Alexander Hogue and photographs from newspapers, the Farm Security Administration and contemporary chroniclers of ruin such as Lewis Baltz. We tried to get beyond obvious, stereotyped responses (remember the 1970s public service commercials featuring an Indian who weeps glycerin tears as he contemplates a garbage-strewn scene?) to better understand the reasons for ecological devastation and to analyze our text and visual materials formally and in depth. We also viewed excerpts from Koyaanisqatsi as a way of introducing film and music to the study of landscape (the film has a marvelous score by Philip Glass with texts from Hopi Indian scriptures). We then moved on to the 15th- and 16th-century explorers, not only noting the obvious contrasts between the modern infernal and earlier paradisal motifs but also exploring important continuities: how might the present devastation be related to the early writers as they inventory resources to be exploited and betray their ambivalence toward an alien American landscape? We then moved through the other periods of American culture, working our way back to the 20th century and to more optimistic visions of the land.

Student evaluation of the course was overwhelmingly positive, but many class members did express frustration over the brief time we could devote to any one writer, artist or subtopic. They pointed out--accurately--that we could spend an entire course on any one of the cultural periods that we flew through. While the scope of the course might be narrowed for the sake of greater depth and thoroughness, I intend to keep my version rather broad. I see the course as a wide-ranging introduction to methods, topics, and figures that will, I hope, engage the students enough for further study on their own. Having experienced the American landscape through a rather kaleidoscopic series of glimpses from various perspectives, my students have (I hope) joined the people in Paul Simon's song: "they've all gone to look for America."

HUMANITIES EDUCATION CONNECTIONS

Ideas and materials for better teaching and learning in the humanities.

Ramón Betanzos

EXPERIENCING THE ARTS: LOOKING AT ART, LISTENING TO MUSIC AND READING POETRY

The Summer 1988 issue of *Humanities Education* carried an article entitled "Constructs of Human Experience: a Course in Interdisciplinary Humanities." It described a course, taught for some years now by the Humanities Department at Wayne State University, on how to read histories, novels, and philosophies critically, stressing particularly the similarities and differences within each of the three kinds of prose writing and across their boundaries. Its intention was to present a "working model" of a course that is not merely multidisciplinary but truly interdisciplinary as well.

This current article describes a second course with a similar rationale, also taught by the same Department and institution for years now. (The person most responsible for the conception and development of this course, especially of its musical component, is Professor Martin M. Herman, Chairman of the Humanities Department.) Once again we deal with three examples of "things people do" as expressions of human nature--in this case, producing and enjoying visual art, music, and poetry--and inquire into their commonalities and their differences. The course proceeds through four distinct levels of treatment.

Level one exposes and analyzes the basic material elements, the "stuff" or raw material with which each discipline works.

Music, as the organization of sounds and silences in time, is analyzed into such variables of time (its proper dimension) as tempo, meter, and organization and into such variables of sound (its essential content) as dynamics, pitch (successive, i.e. melody, and simultaneous, i.e. texture) timbre, and medium. A considerable amount of time is devoted particularly to the types of musical texture across the spectrum from monophony through the polyphonic forms of homophony and counterpoint. [It may be worth noting that in its earliest version this course first addressed the question of how meaning is conveyed in music and art, and that approach yielded unsatisfactory results, especially in music. Why? Because, we found students needed to be trained first to listen, to look, and to hear/read carefully and skillfully; only then should one ask them to entertain probing questions into the meaning of what they had heard, seen, or read.]

Visual art, as the organization of material elements in space, is similarly introduced in terms of the basic media, materials, methods, types of subject matter, etc., used and the variables of size, shape, mass, location, lines, colors, textures, and so on, that one encounters in visual arts.

Poetry, as the organization of words in heightened and intensified language, exhibits great variety, even on its material side (its word-content), in the use of sound values, metrical cadences and their patterns, and literal, figurative, ironic, metaphorical, and other uses of words in tropes.

[It must be clearly noted that these ideas, terms, categories, and so on, are not merely defined abstractly in class but are illustrated copiously. Students are tested not on their ability to identify the names of musicians, artists, poets, or their works, but on their ability to hear a piece of music and speak intelligently about its medium, texture, and timbre; or to see a work of visual art and describe it in terms of its subject matter, its use of lines, shapes, colors, textures, and dimensionality; or to read a poem and comment intelligently on its use of sounds, metrical patterns, tropes, and the like, in making its statement.]

Level two identifies the major formal organizations achieved in each activity. In other words, it takes the material elements introduced in level one and systematically examines how they are combined in formal patterns or recognizable types of organization.

Music achieves unity through repetition and variety through contrast, so that, for example, use of a type of continuous repetition of a Bolero or the varied repetition of a theme and variations piece or the imitative repetition of a fugue. Alternate repetition, that is, repetition in a statement-digression-return pattern, will in turn yield such musical forms as the simple sectional (song) form, strophic and modified strophic songs, compound sectional forms, and rondos. Developmental repetition takes one into the sonata form in its varied guises--such as the sonata, the symphony, the concerto, the string quartet, and so forth--and study of "free forms," such as the through-composed song, recognizes the type of song or piece that does not exhibit a predictable pattern of repetition.

Visual art is shown to achieve an equilibrium or balance among artistic forces in some sort of combination of these forces by way of symmetry, or asymmetry, or counterbalance, or dominance and\or repetition of some prominent visual element in them.

Poetry, in turn, assumes a variety of forms such as the sonnet, the limerick, shaped poems, stanzaic poems, etc., based on the different ways in which conceptual units are grouped in a poem to create a particular effect. Thus, for example, the peculiar pattern of anapestic trimeter and dimeter one finds in the limerick relates not only to quantitative distribution of syllables and accents but to meaning as well. And the Italian sonnet's arrangement into an octet and sextet is how to be not merely a variant quantitative distribution of lines when compared to the English sonnet's three quatrains plus couplet, but a conceptual arrangement as well, which directly and seriously affects the way in which thought is expressed in it.

Testing at this level of the course requires that students not only recognize forms of organization in specific music, art and poetry examples, but also comment on the material elements addressed in level one. In other words, the course covers its material in cumulative fashion. Again, each form of music, art, and poetry.

Level three examines the distinctive ways in which meaning is conveyed in our three areas.

Since poetry consists of words, which essentially denote meaning, that is, have dictionary definitions, poetry essentially denotes or designates a specific meaning. It may also, though secondarily, create onomatopoetic effects, employ layers of connotative meanings--such as the warm overtones and undertones of a word like "mother," going beyond its literal meaning of "female parent"--or embody the meaning of a word by the way it prefigures its sound or shape, such as the words "terse" or "curt" or "lull."

Music, on the other hand, has no denotational or specific meaning per se. While it may make a specific reference in the form of a musical quotation or produce literal sound equivalents--say, the bell and cannon sounds of the 1812 Overture--its essential function is to embody meaning. That is, it creates a dynamic configuration of sounds that parallels or is analogous to human psychophysical states. Hence some music, even though it means nothing specific in itself, may be conducive to serving as a military march or fight song, while other music is better suited to lullabies or love songs. Sound patterns produce music in a way analogous to the way psychophysical patterns produce emotions. "Music sounds the way emotions feel."

Visual art, on the other hand, has specific or denotative meaning if it is representational art, that is, if it depicts or represents recognizable objects from life; it will have merely configurational or embodying meaning if it is nonrepresentational art, that is, if it presents the viewer merely with shapes, colors, lines, but with no otherwise recognizable content. And of course visual art will convey no meaning at all by the way of literal sound equivalents.

All visual art will be seen to convey configurational meaning, that is, the kind of sensual meaning inherent in the visual elements themselves. Thus, some meaning is embodied in visual art through the effect created by "warm" or "cool" colors or sharp, jagged shapes instead of organic, curvaceous ones; or the effect of diagonal, slashing lines instead of horizontals and perpendiculars. Recognizing levels of meaning in visual art will also take the viewer beyond mere sensual qualities into recognizing a particular arrangement of such elements as a human being, a landscape, or a still life. This is a level of meaning we describe as natural, pre-iconographic awareness, the kind any average, untrained person can recognize. In addition, some visual art will depend for its meaning on viewer's iconographic sophistication, which will enable him or her, say, to recognize an Old Testament scene like the sacrifice of Isaac or a mythological figure like Hermes. Finally, all art conveys an all-embracing meaning that encompasses all three of the levels mentioned but also goes beyond them to include all the cultural, historical, philosophical, religious, psychological, and other dimensions that have a bearing on the meaning of any art work.

Testing in this area will include not only the way in which meaning is conveyed and the means used to convey it in each of our areas; it will also call for commentary on the material and formal elements (levels one and two) of the work in question. Again, each aspect of the explanatory schema used is generously fleshed out with concrete examples in class and the provision of materials from students to practice on outside of class.

Level four, finally, applies the principles exposed in levels one through three to a large example in each area of inquiry, for example, Beethoven's Symphony No. 5; Michelangelo's Sistine Chapel Ceiling; and a block of T.S. Eliot's poetry, notably "The Love Song of J. Alfred Prufrock." Thus the Beethoven symphony is analyzed in terms of its organization as an example of a sonata cycle based on its incorporation of sonata form; in terms of the way it conveys meaning in each of its parts; and in terms of the way in which each of the major material variables of music--the tempos, dynamics, textures, timbres, etc.--contributes to the message and meaning of the whole. The Sistine Chapel ceiling is studied not only as an example of a large-scale fresco work depicting recognizable human shapes on a bilaterally symmetrical arrangement of fictive architecture; it is also shown to be an iconographic program of enormous scope involving major motifs of creation and salvation history in Old and New Testaments, Neoplatonic ideas and motifs, papal politics in the early sixteenth century and a host of other elements. And T.S. Eliot's Prufrock is examined not only as an ingenious assemblage of poetic tropes, difficult historical, religious, and cultural allusions, but also as a devastatingly ironic commentary on the crisis of modern humans.

Throughout the course we pay constant attention to identifying principles or conditions or methods peculiar to each expressive medium at each level, for example the contrasts that arise between music and visual art because music is deployed in time while art is deployed in space; or the contrast between poetry with its essentially specific, denotative way of conveying meaning and music with its essentially embodying mode of conveying meaning; or the analogy between the way representational art conveys meaning and the way texted music does, while nonrepresentational art conveys meaning in a manner analogous to the way pure (instrumental) music does. Such similarities and differences are systematically incorporated into the analysis of the interrelationships among the three areas at all levels of the course.

The term "interrelationships" is very important here, for it is the key to true interdisciplinarity and to the justification and need for a humanities department. A good introductory course in music will cover most of what we say about music in this course; a good introductory course in poetry will do the same for poetry. But these separate courses just named do not focus on the interrelationships--the full range of similarities and differences--among these disciplines. These separate courses do not systematically focus on the special logic of their disciplines vis-a-vis other disciplines. Hence ours is a distinctive and unique kind of enterprise; it is not just collecting what other people do and offering it all in one place. This is a major reason why it is important to choose our examples in music, art, and poetry carefully, for we want to select the best examples we can to illustrate the special character of each discipline in contrast with the other disciplines we are considering. There is no question here of duplication of effort if we do our job correctly.

It is of course impossible to describe in a few pages everything that is done in a course that meets for some sixty hours in a semester. My observation of its effect over the years is that it has been a fine learning experience for all those students (and faculty) who have seriously entered into its intent and dynamics. It has helped them to acquire the concepts, the vocabulary, and the skills they need to listen to music, look at art, and read poetry more intelligently than they previously could. It has shown them how to relate these humanistic expressions to one another and to human nature. It has given them a critical yet pleasant exposure to a rather substantial selection of wonderful examples of music, art, and poetry. It is our constant hope that students will be sufficiently motivated and inspired by their experience to make this course function as a springboard, a point of departure, for a lifetime of personal development and enrichment in music, art, and poetry.

ACCOMMODATIONS

Conference participants are responsible for making their own housing arrangements. A special conference rate of $69 per single or double room (triple add $15) is available at the conference hotel, The Hilton Plaza Inn, for reservatrions made before April 6, 1989. Please indicate that you are with the "Teaching The Humanities" conference when making reservations.

Hilton Plaza Inn
45th & Main Streets
Kansas City, MO 64111
(816)753-7400
or
1-800-525-6321

MEALS

Area restaurants are within walking distance.

REGISTRATION FEE

The regular conference registration fee is $55.00. However, for registrations received after March 20 a fee of $65.00 will apply.

The fee includes:

- Refreshments Thursday evening during roundtable discussions.
- Buffet reception Friday evening at the Kansas City Art Institute.
- Lecture and tour at the Nelson-Atkins Museum of Art
- Lecture and reception Saturday evening at the University of Missouri-Kansas City

TRANSPORTATION

Air transportation is available to Kansas City International Airport. Shuttle busses and taxis are available from the airport to the hotel. The Kansas City Art Institute and the Nelson-Atkins Museum of Art are within easy walking distance of the hotel. Bus transportation will be provided to and from the University of Missouri-Kansas City campus.

JAZZ PUB CRAWL

There will be an optional Jazz Pub Crawl beginning at 8:00 p.m. Saturday night. Participants will travel by trolley to several popular Kansas City nightspots to hear live Kansas City jazz. The fee for this excursion is $14.00 per person. Cover charges and drinks are not included in this fee. Confirmation for the Pub Crawl must be received by March 20. Participation is limited to the first 60 registrants.

Please cut out and return the registration form below as soon as possible. After March 20, please complete registration by calling (816)276-2736. Registration confirmation will be mailed to you. For more information contact:

THE ENGLISH CLASSROOM AND CULTURAL EVENTS: BRIDGING BETWEEN TWO WORLDS

Our university has recently embarked on a major effort to reform and restructure its general education program. As part of this effort, the National Endowment for the Humanities is funding a three-year, $200,000 Humanities Core Curriculum Project intended to enhance students' awareness, understanding, and appreciation of the great art, thoughts, and achievements of human beings living under an enormous variety of conditions. In addition to the creation of a two-semester required course in World Civilizations, the project seeks to link Freshman English Composition, already a required course, to the World Civilizations sequence with the goal of using both to integrate cultural resources such as Museum of Art exhibitions, the theater, and musical performances into the core curriculum. One way cultural events can become a relevant and enriching part of any college writing program is through a special "events" assignment in the composition classroom. At the beginning of the semester a list is prepared of suitable upcoming exhibits, performances, and lectures. Instructors have a free hand in choosing which event they will work with and how the assignment will be structured. Most of the assignments so far have utilized either art exhibitions or plays presented by the University Theater. Musical performances seem to be less approachable and/or more difficult to write about without a great deal of preparatory work. The enthusiastic response of art museum docents and theater faculty to requests from instructors to meet with composition classes has no doubt also influenced which events instructors choose to work with.

The need to expose students to new, interesting, and different opportunities and to make them feel comfortable attending cultural events was reinforced by informal surveys done in several classes which showed, for example, that less than half of the students had ever (in their whole lives) attended a live theater performance. When students are introduced to the assignment, their reaction is typically a groan followed by, "This is going to be boring--why do we have to do it?" Afterwards, the finished papers show a definite change of heart and many students rank it as the most interesting assignment of the semester.

So, how do various instructors approach this "cultural literacy" component of their course? The types of assignments tried so far include response pieces, descriptive writing, compare and contrast papers, critical analysis, and reviews. Often prewriting exercises are used to help students work up to a final paper about which they may feel very uncomfortable at first.

For example, one instructor decided that the final project would be a descriptive paper based on a textile exhibit, "Master Weavers of India." This instructor found it essential to prepare students to relate to this form of art through an in-class prewriting activity using art prints borrowed from the Library. The class was divided into groups of three to four persons and each group had to write a description of its particular print. One by one, the class as a whole was read each description and shown the print from each group. The discussion that grew out of this prewriting provided an excellent situation for encouraging students to generate ideas, insights and personal reactions to art in an organized manner for perhaps the first time in their lives. Another instructor found that the more he was willing to share his own feelings and appreciation in layman's terms for pieces of art, the more students felt comfortable venturing into their own first interpretations.

In order to give both structure and substance to student interpretations of almost any art form, they need to be given certain basic questions to apply to the piece(s) being critiqued. One English 101 instructor found best results by presenting students with the following list of questions to be used as they attended a photographic exhibit on India by Robert Holmes:

1. What is the artist trying to accomplish (say) in this exhibit?

2. How successful has he been? (Focus on two or three representative pieces as you describe in detail what worked or what did not.)

3. What is your personal reaction to the exhibit? Did it give you new ideas/insights? Did you find it attractive? Did it relate to your life? Remind you of other things? Teach you something of value?

4. Would you recommend that other people attend this art event? Why or why not?

After prewriting activities and attending an artistic event outside of the English classroom, the real work of writing can begin. An instructor who sent her students to a portrayal of the lives of children in a Nazi prison camp in the play I Never Saw Another Butterfly, found student writing was most effective when they were presented with a clear outline of how to translate the art experience into coherent written form. To bring this process within student reach, she organized the following three-part guide for a critical review/analysis essay:

Introduction:

- name of author and work

- theater and production company

- brief summary of the work

- thesis (the main point you hope to make in your review: the intention of the author and/or director as you see it)

Body:

- description, analysis, and interpretation of the elements in the play that support your thesis. (Characterizations, dialogue, sound effects, staging, costumes, lighting, symbolism, among other elements, are all possibilities.)

- Remember to support your statements with specific examples and descriptions as well as to explain how these elements contribute to the effect of the play as a whole.

Conclusion:

- your evaluation of how well the play lived up to its intentions

1072

- your critical assessment of the value, significance of the work (positive or negative). How did it affect you as a member of the audience?

After much experience with out-of-class events, one instructor has several tips to offer for best results. All assignments need to be clearly outlined and handed out in written form so that students get a sense of knowing what is expected of them as they explore new territory. Teachers must stress the importance of taking advantage of any documentation such as programs, biographical backgrounds of artists, and exhibit booklets that are usually available at artistic events.

When possible, it is most valuable not only to talk to the artist involved, but also to use direct quotations in the resulting piece of writing. Perhaps the most vital element to an insightful student critique (especially of an art exhibit) is to make sure students go more than just one time. This instructor accompanies the students on a regular docent tour of a given exhibit, then returns during the next class session, sits in a circle surrounded by the art pieces, and discusses them further, encouraging student input and interpretations.

The coordination of English Composition assignments with museum exhibitions and theater and musical performances has accomplished a great deal toward bringing these resources effectively to bear on improvement in the general education curriculum and increasing the level of cultural literacy among the students. But above all, the "events" assignment is a writing assignment, dealing with the thinking and writing tasks involved in the liberal arts. It "bridges between two worlds," providing meaningful content to the Freshman Composition class that students can relate to another part of their lives, both during their college years and beyond.

GREAT CLASSROOM HANDOUTS OF THE WESTERN WORLD: I

Editor's note: A few months ago a reader proposed that we solicit classroom materials that have been found useful for any aspect of teaching humanities. The first response was from Ernest F. Rager, who is on the Humanities Faculty at Richland College, a county community college in Dallas, Texas. His "philosophy of life" assignment is an icebreaker for the wide variety of students who come to his college. Many are part-time older students or students who are starting college late. Mr. Rager provides these comments about the context and value of this activity:

"The Philosophy of Life assignment is an early part of the Introduction to the Humanities 3-credit course at Richland Community College in Dallas. The course has a variety of objectives which include introducing students to the classical humanities and art museum and symphony orchestra attendance for which reaction essays are assigned. The Philosophy of Life assignment is designed to evoke personal responses to questions that may have aesthetic, moral or values implications and to establish a degree of rapport between the students and me. Although the paper only counts for ten of the 350 points possible in the course, it has been especially successful in that most of the students seem to give the assignment their most serious consideration. Their responses serve to keep me accurately and currently informed of the wide variety of perspectives on life and education in a typical class of community college students.

Before papers are returned, I read aloud from those papers for which I have permission from the students to do so. Thus students are informed of the usually wide variety of each other's responses. Then I offer to answer any questions on the assignment or any other questions that the students have about my Philosophy of Life. Question #13 is a new question for this semester and in three of five classes the students also asked the question of me. It turned out to be an excellent nonthreatening way for me to talk with the students about what irritates me in a class.

The most common shortcoming of the assignment on the part of the students has been that a large percentage of them cannot type nor are they careful proofreaders of what they turn in.

To my knowledge I have never received a complaint about this assignment from any of the several thousand students over many years who have completed it.

Although the Philosophy of Life assignment as such is original with me, I am grateful to other professors and to students for ideas and inspiration."

Date Due______________________ Typed_______

Introduction to the Humanities Answers Numbered_______

No errors, strike-outs, etc._______

(re-type your sentences containing errors and return the corrected sentences to me)

Name______________________________

Section_______Points_______(10 possible)

Philosophy of Life

May I read to the class from your paper? yes no (circle)

May I show your shield to the class? yes no (circle)

Do not write the questions. Do number your answers down the left side of the page. One point off for mechanical errors up to two points maximum. Papers are returned upon three errors without a grade for resubmission with zero mechanical errors.

Answer any two of the following:

1. What is your favorite art and music and why do you like it? Give titles.
2. What is there in people's experience or in world history that proves that God exists?
3. Describe the organization of the universe from the smallest particle(s) to the largest configuration(s). Describe where the earth is located within the organization that you have described.
4. What is meant by 'Humanities"?

Select any eight of the following questions: (circle the ones you have answered)

5. What questions most often cross your mind?
6. Describe your scientific interests.
7. What would you do with an extra million dollars?
8. What are you most afraid of and is there a belief that you would die for?
9. What is the most pressing problem facing the world or our country and how would you deal with it if you were in charge?
10. To what extent are you aware of the effects of classicism and romanticism in society today? Give examples.
11. What is your most consuming pet peeve and what's the funniest thing you ever saw or heard?
12. Who do you most admire and why?
13. What irritates you in a class?
14. What books really count for you?
15. Tell some differences that game scores have made in society.
16. Who (past or present) do you think is evil?
17. About the author (your resume):
18. On this answer, express anything else not asked about above.

Now draw a shield on the back of the last page of your paper.
Divide the shield into three parts. Label the parts "Philosophy of Life", "Concerns about this Course" and "Goals in this Course." Draw/Find a symbol for each and place them in your shield. Place your motto under your shield.

Use this sheet for the cover page.
Three points off for a late paper.

I have visited the Dallas Museum of Art? no yes When?__________

I have attended a symphony orchestra concert? no yes When?________

_____________Which orchestra(s)?______________

ISSUES IN HUMANITIES EDUCATION

Issues thinking has its merits if it lends clarity to the choices confronting us in understanding the whole. The following issues confronting humanities education are cast in either/or terms as a guide to clarifying our choices as humanities educators, but of course we need not be restrictive. "Both/and" is the response many of us may make when confronted with any dichotomy of issues. The issues divided in the following list are no exception and will be profitably viewed for "both/and" possibilities.

Goals of the Humanities

cultured men and women (refined or gentled, freed from ignorance and callousness)	vs.	self-aware men and women committed to personal fulfillment of their human ties

Methods of Teaching Humanities

dates and facts ("cultural literacy")	vs.	original sources ("texts," "artifacts," "performances") and a theme of human connection
canon (what part of the canon if all not possible?)	vs.	process (functions of signs and symbols and narratives in personal, national and world culture)
style and content of the humanities disciplines (multidisciplinary and multi-cultural study of "texts")	vs.	themes and traditions (interdisciplinary and intercultural study of "texts" in contexts)

Definition and Scope of Humanities Curriculum

historical/heritage survey	vs.	aesthetic education
western tradition	vs.	global education
know your own history first	vs.	know humanity first
know what the canon is	vs.	selections in depth from the canon (world classics? national literatures? popular culture?)
cultural perceptivity	vs.	critical/creative thinking

Preparation of Humanities Teachers

in a discipline	vs.	inter- and cross-disciplinary preparation
by Education professors (theory-of-learning oriented)	vs.	by Humanities professors ("text" oriented)
in lecture methods	vs.	in alternative teaching styles
licensure	vs.	"apprenticeship" to master teacher(s)

Adding Humanities to the Curriculum

Humanities as enrichment subject	vs.	Humanities as core subject
squeezing out existing curriculum subjects	vs.	integrating existing subjects
squeezing out existing faculty	vs.	recycling faculty

Special needs of Humanities classroom teacher

programmed learning	vs.	learning centers or open space education
basal "readers"	vs.	individualized "reading" programs
teacher choice	vs.	heavy learner input
a textbook/workbook framework	vs.	teacher-developed units
conforming to prep patterns in a discipline	vs.	special prep time/facilities for special materials gathering
discipline restrictions on professional development	vs.	discipline crossover for professional development

Assessment and Accountability

placing Humanities under the umbrella of one of the disciplines	vs.	need for specific policies guiding Humanities education
finding help in "departments" of several discipline organizations	vs.	need for clearing house/ professional organization to serve Humanities teachers

Curt Dornberg, Ph.D.
Humanities Program Leader
Mankato State University

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

ROMANTIC

Matthew Brennan, Wordsworth, Turner, and Romantic Landscape: A Study of the Traditions of the Picturesque and the Sublime. Columbia, S.C: Camden House, Inc., 1987. 165pp. $28.00.
Reviewed by Dr. Elaine L. Kleiner, Indiana State University

Relationships of literature with the fine arts and music are both complex and various. Each art has its individual evolution, its unique internal structure of elements, and its own history in time. The arts are in constant relationship with each other, but these relationships form a complex dialectic, an intricate pattern of coincidences and divergences, rather than a simple system of parallel lines. Works of art may become themes of poetry and, in turn, literature can become the theme of painting or music. One art may attempt to achieve the effects of a sister art. The fine arts and literature may induce the same mood within the mind. Artists in different media may directly influence one another, sharing theories and conscious intentions. And the arts may be compared on the basis of their common social and cultural background, "signature," or "time spirit." Matthew Brennan's new study of relationships between the poetry of William Wordsworth and the paintings of J.M.W. Turner touches upon several of these strategies of comparison while focusing on shared structural elements employed by each artist in rendering common eighteenth-century modes of landscape, the picturesque and sublime.

Brennan's introduction carefully addresses central difficulties posed by comparative study of the arts together with the special difficulties involved in comparative study of Wordsworth and Turner. The two never met. They may have been unaware of one another's work and no clear evidence of their reactions to one another exists. But they did share some mutual contacts in the London art world and each accepted the eighteenth century's theories on the affinities of poetry and painting. Their creative practices were similar but their philosophical outlooks on life are usually recognized as being quite dissimilar. Both were indebted to the idea of the Picturesque as it was articulated in the work of William Gilpin (the 3-plane structure of picturesque landscape) and James Thomson (the single-sentence technique of moving the eye immediately to the horizon and then returning to linger on details of foreground and middle distance). But neither maintained a pure interest in the Picturesque for long, its conventional, prescriptive nature being too limited for their revolutionary imaginations (47).

In a chapter entitled "The Positive Sublime," Brennan compares Wordsworth's earliest experiment with the Sublime, "Tintern Abbey," with Turner's At Stourhead and Dido Building Carthage. Both artists are said to produce an effect of sublime indistinctness, of the external world dissolving, through their treatment of light. Both are said to transcend the Picturesque through the Sublimity of light,

> ...shifting attention from the objects seen to the subject seeing. In the Positive Sublime, which these works typify, the perceiving mind overflows with an overwhelming plentitude and tries to grasp something it dimly sees in the deluge of radiant light (55).

Brennan explores each artist's rendering of light in sunrise, light in sunset, starlight, moonlight, and nightfall through several works including Wordsworth's The Prelude and Turner's watercolors of Castle Upnor, Kent, Flint Castle, Sun Setting over a Lake, Keelmen Heaving in Coals by Moonlight (1835), and Keelmen: Fishermen at Sea (1796), finding common principles controlling the structure of visual experience underlying each.

In "Negative Sublime," Brennan turns his attention to Book VI of The Prelude and Turner's The Angel Standing in the Sun (1846), works which combine elements of both the Positive and Negative Sublime, those vortex-like images of the abyss, images that obliterate perspective and symbolize "a complete divorce from the phenomenal world" (79). Several books of The Prelude and Turner's masterpieces Hannibal, The Slave Ship, and Snow Storm are analyzed to make the point that together both artists deepen the sense of the eighteenth-century Sublime.

> ...instead of focusing on the outward forms of the ordinary world--lightning, storm clouds, precipices--they turn inward to face "That awful Power" in "the mind's abyss, " a power so awful it can transform even the mundane into the Negative Sublime (98).

In a subsequent chapter, Brennan points out that Turner is not the only painter whose sublime landscapes parallel Wordsworth's landscapes of the mind. The watercolorists Macpherson, Girtin, and the Cozenses created analogous landscapes in which "the attention of the eye's mind is led from the external world of sense to the invisible world of the prospects of the mind" (108). And in a final chapter, Brennan reviews the conventional comparison of Wordsworth with Constable, showing that although the two resemble one another in revolutionizing the subject matter of art, they take different directions after rejecting the Picturesque. Wordsworth and Turner represent the structure of the perceiving mind at the sublime moment but Constable avoids this theme in favor of naturalism. Brennan's explanation of why Wordsworth and Turner were drawn to the Negative Sublime whereas Constable was not seems forced and unduly Freudian. But this seems the only weakness in a careful study which can clarify not only the particular romanticism of Wordsworth and Turner but also Romanticism in general.

TOURING A TEXT

Richard Phipps and Richard Wink, Invitation to the Gallery: An Introduction to Art (Dubuque, Iowa: William C. Brown Publishers, 1987), pp. 380
Reviewed by Terry Zeller, School of Art, Northern Illinois University.

Phipps and Wink have taken a novel approach in structuring their book on art appreciation around the collections of eleven major European and American museums. Divided into three parts--the first devoted to the elements and principles of art; the second tc period styles; and the last to environmental, technological, and ethnographic art--the volume is comprehensive, if somewhat uneven, in its survey of the visual arts.

Each chapter or "tour" begins with a brief description of the museum whose collections are discussed, followed by an overview that establishes the focus of the chapter by stating the objectives and major points to be covered. A summary at the end of the chapter reiterates these points. Excellent "viewing exercises" designed to have readers apply to works of art what has been learned on the tour are provided at the end of each chapter. These viewing activities, frequently involving the comparison and contrast of works of art and often, particularly in the style section, asking readers to make comparisons between specific musical compositions and paintings or sculptures, help to sharpen visual perception. Questions in the viewing exercises emphasize the formal and expressive qualities of art and concentrate on description and analysis rather than on interpretation and critical judgment. All chapters also contain a number of suggested studio exercises that afford students the opportunity to apply what has been learned by using a variety of media and techniques. These studio exercises are intended to introduce students to the processes of art and to acquaint non-art majors with the materials and methods of drawing, painting, collage, sculpture, and other media, and as such are appropriate and valuable in developing an appreciation of the creative problem-solving involved in producing works of visual art. A list of suggested readings is included at the end of each major section of the book. With few exceptions, the forty-one biographical sketches of artists given at the end of the volume are limited to late nineteenth-early-twentieth-century artists; a further reinforcement of the authors' formal-expressive approach to art appreciation. Specialized art terms are printed in bold type in the text and are defined in an extensive and useful glossary illustrated with excellent line drawings. The correct pronunciation of technical terms and artists' names is given in the text. The volume is heavily illustrated with black and white photographs and many high quality color reproductions. Line drawing and diagrams in each chapter also help readers to grasp major points about composition, technique, and media. The authors have written in clear and simple style, easily comprehensible to beginning undergraduates. A consistent pattern is followed throughout the book of stating major ideas at the beginning of a chapter, illustratsing/elaborating them, restating the significant points in the summary, and finally reinforcing them through applications in the viewing and studio exercises. Phipps and Wink have made a concerted effort to include art from a broad cross-section of cultures and time period, and to include work by women, most of whom are well-known artists of the late nineteenth and twentieth centuries.

For all of its originality in organization and instructional activities, Invitation to the Gallery is traditional both in its content and approach to art. Although the chapter on environmental art strikes one as somewhat novel, for the most part art for Phipps and

1081

Wink is a matter of painting and sculpture. While their intent may be to feature the collections for which particular museums are noted (a reasonable and interesting basis on which to organize material)--antiquities at the British Museum, Asian and medieval art at Cleveland, Impressionism at the Art Institute of Chicago, etc.--virtually all of the museums "toured" contain collections of decorative/applied arts that might have been utilized by the authors in their discussion of either the elements and principles of art or their exploration of style. However, given the essentially formal-expressive orientation of the book with its intention of helping readers "to know something of what artists are communicating to us" (p. 3), and its notion of style as predicated on "shifts of emphasis...between form and feeling" (p.87), students may come away with a rather narrow art-for-art's-sake impression of the nature and function of the visual arts.

While the authors do a skillful job of defining the characteristics of period style in a manner that serves the reader as a model to be used in approaching other works of art, this stylistic explication and the viewing activities are strictly formal in nature, intended to teach students that looking at works of art is, by and large, merely a matter of describing, analyzing, interpreting, and judging art on the basis of formal and sensuous qualities. Little attention is devoted either to subject matter or to iconographical analysis. Admitting that they "include political, social, or religious insights only as they pertain to the works' aesthetic merit" (p. 91), the authors remove artifacts from their cultural/historical context, making it difficult for readers to understand the role of art in society. Phipps and Wink tend to see art as the recurring effort of artists to solve basic problems of form and expression; it is an intrinsic view of art that gives little play to non-aesthetic ideas and influences. Given this outlook, it is not surprising that the chapter on architecture deals exclusively with twentieth-century structures, and primarily those since the 1930s.

The traditional bent of the book is also apparent in the amount of space devoted to French and Italian artists vis-a-vis those from other countries. In discussing Romanticism, for example, the authors not only stress the work of the French while all but ignoring the important contributions of northern Europeans, particularly the Germans (save for a fleeting mention of Bocklin), but also perpetuate stereotypes of the troubled, tempestuous, rebellious romantic artist. Russian art before the twentieth century is ignored, while American artists receive only a passing nod until the twentieth century, and Scandinavians must be satisfied with the mention Munch receives. By not discussing the contemporary art of Afro-Americans, American Indians, or the Third World, the authors again reveal their attachment to tradition. Since the only structured exposure to art most undergraduates have is in an art appreciation survey course, it is important that they receive more than a formalist-expressive interpretation of the standard works of "high art."

In spite of its limitations, there is much to recommend Invitation to the Gallery as a textbook for art appreciation courses. It is well-organized, concise, and readable. The viewing exercises, studio activities, and visual aids to analyzing works of art, all based on a wealth of excellent reproductions, are valuable in helping students to develop informed and discriminating responses to art. But the paucity of contextual information found in the formal-expressive approach taken by Phipps and Wink will do little to help students discern the multiple layers of meaning contained in most works of art. To provide an adequate and balanced appreciation of the visual arts, particularly in survey humanities courses, this book will have to be supplemented by books and articles on the social history of art.

RENAISSANCE PROPAGANDA

"What Brunelleschi Saw: Monument and Site at the Palazzo Vecchio in Florence" by Marvin Trachtenberg in Journal of the Society of Architectural Historians, March 1988. SAH, 1232 Pine St., Philadelphia, PA 19107. $48/yr.

Two imposing structures dominate any view of Florence. The Duomo--the domed church of Santa Maria del Fiore which represents in so many ways the beginning of the architectural Renaissance; and Palazzo Vecchio, the grim fortress-like palace, surmounted by a 300 foot high masonry tower that equally exemplifies medieval values. The contrast in values is powerful: Palazzo Vecchio's dimensions are an irregular quadrangle, the tower is asymmetrical, precariously overhanging the building beneath it, and its setting is in a wide piazza that is crudely L-shaped with nary a right angle save for one corner of the Palazzo. This is barbaric gothicism to our renaissance-trained eyes that look for symmetry, mathematical harmonies and rational rhythms of colonnades.

It's not that simple, says Trachtenberg of NYU's Institute for Fine Arts. Careful measuring and archaeological study reveal that both the Palazzo and the Piazza are carefully wrought masterpieces of urban design. The Palazzo was constructed following a reign of terror and civil war that subjected one-tenth of Florentine real estate to arson. A symbol of authority, strength and integrity, its watchtower guards not only the walled city, but the countryside as well.

The peculiar shape of the Piazza resulted from its location between two urban planning zones, Roman Florence, a north-south grid, and medieval Florence when streets were oriented along the river. During the years 1299-1389 the Florentines made major refinements to bring the Piazza closer to square. Additions were made to some buildings, others were drastically amputated, others were veneered with rough stone to harmonize with the Palazzo. Not at all haphazard, the alterations were governed by a desire to interrelate space, structure and citizen to the best advantage. Thus, the longest axis of the square is identical with the height of the watchtower and streets were widened to provide the best angles for encountering the square and palace.

Why has this gone unnoticed up to now? Mainly because of our having been "distracted by self-serving Renaissance propaganda about the rudeness and unsophistication of the preceding age." There was one exception, says Trachtenberg. Brunelleschi, who invented scientific perspective, made this Piazza one of the subjects for the first two perspective paintings of modern times.

ETHICAL CHOCLATIER

"Ethical Managers Make Their Own Rules" by Adrian Cadbury in Harvard Business Review, September-October 1987.

Secure in our humanities classrooms, and even more secure at home as we watch corporate commercials on television, it is easy to criticize the shabby ethics of the business world. This easy judgement is an example of what Sir Adrian Cadbury calls "the ethical superiority of the uninvolved." Special-interest pressure groups have a distinct advantage over decision-makers, because the pressure groups do not have to take account of all the interests concerned.

Business leaders do, or at least they should take account of all interests, if they are to be ethical managers.

But it is never simple. Even developing a published "code of ethics" is unlikely to do much to clarify real ethical decisions, because as Cadbury (who is chairman of the company that makes Cadbury chocolates and Scheppes sodas) says, "Our ethics are expressed in our actions, which is why they are usually clearer to others than ourselves." Some examples of ethical dilemmas that are not helped by codes have arisen because of Cadbury's multinational business. Different nations and their governments and businesses may operate on widely divergent ethical premises than those of the company: promotion on merit may be company policy, but promotion by seniority may be the foreign country's tradition. There are many countries in which payments to customs personnel and gifts to desired customers are routine, while in other countries these are unethical acts of bribery. What courses of action are open? One is to do business only in nations that share your ethical standards. Another is to assume a high moral posture and refuse to go along with the customs of the country. A third is go along with them, and disguise the bribes from your auditors. Cadbury takes a fourth course of action which represents what is meant by the title of this Harvard Business Review ethics prizewinning article.

Openness is his policy: "openness and ethics go together...actions are unethical if they will not stand scrutiny." So the unusual payments appear on the invoices as just what they are, necessary expenses for completing a business deal. These have included payments to local police and planning commissions. Openness is also a suitable standard in other company decisions, including very unpopular ones. Most insidious of all, though, is the common practice of managers and boards putting off or shelving or washing their hands of problems that are brought to them by public clamor. There may be good commercial reasons for such actions or inaction, but they are rarely ethical.

REPORT CARD

Humanities in America. A report by Chair, Lynne V. Cheney, available from the National Endowment for the Humanities, Washington, D.C. 20502. Abstract and commentary by Sharon Scholl.

The report is the first of such documents (mandated by Congress in 1985) scheduled to appear every two years. It is a synthesis of solicited statistical data and opinions of three advisory groups considering the place of the scholar in society, the impact of electronic media, and public humanities programming. Educationally, the university was the focus since K-12 was the focus of the 1987 report, "American Memory".

Offering evidence that the Humanities are alive and well, Cheney cites the activities of state Humanities Councils' programs, historical association memberships, attendance at Shakespeare festivals, Ramses II popularity, and national spending on admissions to "cultural" events (exceeding by 10% the amount spend on admission to spectator sports). By all the (largely quantitative) tests that influence Congress, the Humanities are, indeed, flourishing.

Like a dark specter standing against this rosy picture is the "disarray, isolation, rupture, and distrust" the Humanities endure on our college campuses. Humanities scholarship reeks of esotericism and holds

1084

all intellectual and esthetic valuation as transitory matters determined by political factors. Narrowness of specialization compounded by job unavailability has almost assured the loss of significance of the Liberal Arts as a whole and Humanities in particular. All together, these conditions have led to a chasm between the academy and society.

The "canon," always more malleable than generally thought, has come under fire once again, this time as an arbitrary bastion of political privilege; teaching is increasingly viewed in some quarters as a form of political activism. Colleges have relinquished the responsibility for persuading students of the value of knowing at least the outlines of Western culture history. The classic Western Civilization courses have dissolved in some universities into a welter of ethnic studies offerings.

In another area of concern, the influence of electronic media has been profound and disturbing. On the positive side, a television presentation can lead to a dramatic rise in sales of important books. Film studies can be as intellectually significant as literary studies. Educational television is a major institution in itself, whose work parallels and assists that of the academy.

Humanities in America gives the strongest endorsement to the efforts of the NEH state based programs and such public attractions as "William Wordsworth and the Age of English Romanticism." Humanities scholars working in libraries, museums, and heritage centers now constitute a parallel faculty rivalling that of established educational institutions. Adult education in the Humanities fails only in having a general coherent plan of study and process of evaluation.

What, specifically, does the report recommend that is applicable to colleges and universities?

1. That "research" be more broadly construed to include curriculum research, and that it need not result in publication.

2. That we "depoliticize" the study of texts. It goes without saying that every text has something to do with gender, race, class, period, etc., but they also speak to the deepest strata of human concern. This latter belief must be recovered, and grounding in Western as well as non-Western texts is necessary.

3. That important media productions such as "Voices and Visions" can serve as instructional links between the academy and the student, as well as the general public.

4. That we adopt something of the variety and public spiritedness of the museums and state-based endowments and reconnect with the larger contexts of American society. The generalist needs encouraging. Faculty need closer contacts with our culture as a whole.

In the light of all this, what should Humanities study at the college level be accomplishing? The NEH report could well have written the purpose statement for NAHE when it queries: "Do they take away from their undergraduate years a sense of the interconnection of ideas and events -- a framework into which they can fit the learning of a lifetime?"

NOTE: The following review is in part a reply to Dr. Cheney's report.

1085

REBUTTAL REPORT

"Speaking for the Humanities", a report from the American Council of Learned Societies. Text published in The Chronicle of Higher Education, January 11, 1989. Reviewed by Fred Schroeder.

The debate goes on. Bennett, Bloom, Hirsch and Cheney have all attacked some aspect of the humanities from elementary school to post-graduate research. This report is actually a counter-attack. The authors are all literature professors who also are directors of interdisciplinary humanities institutes at such places as Harvard, Yale, Cornell and Stony Brook. Of the recent publications, they find only The Humanities and the American Promise to be an admirable study.

Of the others, the authors say they "would be comic...if they were not taken so seriously by so many people."

The comic view is that the humanities are much to blame for major moral and social changes in America. Lacking the nerve to uphold the great classics, the humanities have caved in to political and social forces, and have replaced the canon of great books with trivial ideological works. Further, the professors have abandoned understandable general education for the jargon of arcane specialized critical schools and narrow historical topics. This last cluster of accusations are the ones that the authors seem to find most alarming, and as they are all from eastern graduate and postgraduate think tanks, their alarm may be justifiable. The report seems unaware that most undergraduate humanities education takes place in a thousand state universities, small colleges and community colleges. But then, anyone who has read their opponents will recognize many of the attacks are aimed straight at a few universities.

Nevertheless, all professors in the humanities (which is not quite the same as all humanities professors) share equally in the popular perception, so it is worthwhile to encapsulate a few of the rebuttals in this report.

For example, Bloom and other denigrators are terribly simplistic about causation. Changes in the curriculum and in society are not caused by a failure in nerve alone. Economically and politically the world has changed from the days of Talleyrand and Bismarck. These changes have made humanists do what they have done since Socrates: They question, yea, even unto the sacred canon.

Specialization is not bad. It is essential not only to understanding a topic fully, but it provides the building blocks out of which new broader syntheses are made. Moreover, among the best scholars, the "big picture" and broader significance is not forgotten. And the counter to over-specialization is already there in the very institutions that are under attack. The authors, recall, are all directors of cross-disciplinary centers and institutes. They suggest that the combination of unconstrained specialization and cross-disciplinary activity are a wholesome (if contentious) arena for humanities--far more lively and useful than "a vision of the humanities as repository of known truths and received values."

As to the attack on ideological approaches (e.g., Marxist, feminist, etc.) the authors point out that the denigrators have "unacknowledged ideologies" that are as doctrinaire as any open ideology. Indeed, the great works that are so revered were not produced in a vacuum of objectivity nor in an aura of universals. Virgil, Shakespeare, Michelangelo expressed contemporary ideologies. Thus "when viewed historically texts are most fully humanized, and the strangenesses in them become accessible in new ways."

Relativism is an evil to Bennett and Bloom; the authors of this report suggest certainty may be more dangerous.

On the need for a core curriculum, they acknowledge that the crisis is authentic, but that the solution of restoring a fifty-year old required curriculum is simpleminded. No matter what is chosen to be in a curriculum, it is still a choice, and the ways that choices are made are always complex. The problem of "representative" sampling of non-Western and minority works brings up many choices, because we can't do everything. But the same is true of the old cannon. In short, an American core curriculum must be dynamic, filled with debates, compromises and constant questioning.

Other concerns are answered with thoughtful skepticism. The declining enrollments in humanities, presumably a product of "cultural relativism" and modern criticism, appears to have been a passing trend of the marketplace. The increase in business and economics majors of the past decade, has reversed, but the authors doubt that the cause either way was due to an upsurge of excellent teaching in one field and a failure of nerve in the other.

The denigrators have made much of the separation of the best scholars from teaching basic courses to undergraduates.While this may have some truth, " at Yale, Harvard, Cornell and Princeton...even the most senior and distinguished faculty in the humanities devote at least half their time to teaching undergraduates." The reverse in true in the sciences. Furthermore to increase undergraduate exposure to "stars" is tantamount to advocating large lecture courses rather than the small classes that are so much more effective for student-faculty interaction.

"Speaking for the Humanities" is a thoughtful, dignified reply to viewers-with-alarm, but it is unlikely to touch the popular mind or the agents of funding support. For readers of Humanities Education, it is most interesting in that the defense and counterattack comes from interdisciplinarians who are also specialists.

Do you have a "great classroom handout" to share with our readers? A reading guide to the Iliad? How to listen to a symphony? A writing assignment that really teaches critical thinking? A sure-fire discussion format?

Send it to us, with a page or two about the context, the record of success, the potential for converting to other uses, etc.

We'll publish as many as we can as space is available.

GRANTS, PAPERS, CONFERENCES, POSITIONS, ETC.

Grants

For conferences in the humanities. Contact: Division of Research Programs, Room 318, National Endowment of the Humanities, Washington 20506; (202) 786-0204. Deadline: **February 15.** This program has several deadlines during the year depending on the time of year for which an award is requested.

Papers

May 1 is the deadline for proposals for the **Thirteenth Annual Humanities and Technology "Interface" Conference** in Marietta GA. The conference will be October 19-20. Contact Dr. Charlie Weeks at (404) 424-7202.

We may doubt it, but February 15 is the deadline for proposals on **Skepticism**, to be held May 5-6 at the University of Rochester. Contact Richard Feldman, Department of Philosophy, U. of Rochester, Rochester, NY 14677.

Proposals for presentations at **The Conference of Black Women in Higher Education** to be held in June in Philadelphia must be sent by **February 10** to: Caroline E. Addison, Nursing, School of Education and Human Services, University of Detroit, 4001 West McNichols Road, Detroit, MI 48221; (313) 927-1390.

Popular Culture Association in the South invites papers, panels, performances, etc., from any disciplinary perspective. Send proposal title and 50-150 word abstract by **May 1, 1989** to: Dr. Elizabeth Bell, PCAS/ACAS Program chair, Department of English, University of South Carolina-Aiken, Aiken, SC 29801. The conference will be held in Jacksonville, FL, October 5-7, 1989.

The International Journal of Humanities and Peace (annual), edited by NAHE past-president Dr. Vasant V. Merchant, invites subscriptions and papers for possible publication. $15.00. Focus of the 1989 Annual: Contributions of Women. Journal address is 1436 N. Evergreen Drive, Flagstaff, AZ 86001.

The Yearbook of Interdisciplinary Studies in the Fine Arts calls for papers of 3,000-6,000 words; MSA; on interrelationships between arts (two or more art forms), and ideas. Deadline: **April 1, 1989.** Send to: Dr. Jessica Haigrey, 104 Lindley Hall, Ohio University, Athens, OH 45701-2979.

Conferences

Enclosed with this issue is the program for the **NAHE National Convention.** An additional registration form is printed on page 22 of this issue of Humanities Education. Please note that you can charge the registration fee to your bank card and that there is a toll-free number for hotel reservations 1-800-525-6321. Our thanks to Jim Mehl for great planning!

Earnest Boyer will keynote **"Rethinking the Curriculum: A Conference on Integrated Interdisciplinary Education"** in San Diego June 19-23 1989..Call Dr. Mary Clark at the college of Extended Studies, San Diego State for information. (619) 594-6255..

Ferris State in Big Rapids Michigan will have its second annual conference on **Humanities, Science and Technology** April 7-8 1989. Russell Kirk will be the keynoter. (612) 592-2211 for more information.

NAHE members Susanne Leggett and Steve Hilsabeck were among the organizers of the second annual Teaching Conference for Interdisciplinary Studies on "Reflections of American Culture: Images of Ourselves" to be held at the Art Institute of Chicago February 10, 1989. (312) 446-7000 Ext. 200 for information.

Southern Humanities Conference. February 16-18, Hilton Hotel in Macon, GA. For information call (912) 741-2357 or write SHC, Department of Interdisciplinary Studies, Mercer University, 1400 Coleman Avenue, Macon, GA 31207.

South-Central Conference on Christianity and Literature. February 16-18, Ramada Hotel St. Charles, New Orleans. For information write to: Pheobe S. Spinrad, Department of English, Ohio State University, 164 W. 17th Avenue, Columbus, Oh 43210.

South Central Renaissance Conference. March 30-April 1. Interdisciplinary conference hosted by Lamar University, Beaumont, Texas. For information write to: Phoebe S. Spinrad, Department of English, Ohio State University, 164 W. 17th Avenue, Columbus, OH 43210.

Perspectives on Contemporary Legend: The Public Face of Legend. March 30-April 1. Sponsored by the International Society for Contemporary Research, The Department of anthropology, Texas A & M University, and the Centre for English Cultural Tradition and Language. For information contact: Dr. Tom Green or Dr. Sylvia Grider, Department of Anthropology, Texas A & "M University, College Station, TX 77843; (409) 845-5242.

Southeastern Regional Conference on Christianity and Literature. April 13-15, Savannah State College, Savannah, GA 31404; (912) 356-2312.

Positions (still being advertised as of January 1989)

Chairperson, Department of Humanities. Small, liberal arts, historically Catholic women's college. Send application, vitae and references to: Robert Hahn, Academic Dean, Trinity College of Vermont, Burlington, VT 05401.

Tenure-track position in Interdisciplinary Humanities, Western Civilization. Filing dates generally Jan/Feb '89; positions available August '89. Candidates must have Ph.D. or terminal degree. Contact: Dr. Joseph Satin, Dean of Arts and Humanities, California State University-Fresno, Fresno, CA.

Tenure-track position to teach undergraduate humanities classes. Ph.D. required. Send application, resume, and three current letters of recommendation to: Robert J. Scheeler, Chair, Division of Humanities, Minot State University, Minot, ND 58701.

Post-doctoral Harper and Mellon Instructorships of 1989-1990 academic year. Open to scholars who will have received Ph.D. degrees no later than June 30, 1989. Application deadline: February 15, 1989. Send curriculum vitae, three letters of recommendation, writing sample (preferably part of dissertation), two page statement of goals and strategies for teaching a particular text for a humanities or social sciences core course, and SAS postcard to: Ralph W. Nicholas, Dean of the College, The University of Chicago, Box 1 A, 1116 East 59th Street, Chicago, IL 60637.

Two tenure-track and one fulltime temporary (possible tenure-track) positions, 1989-90. Liberal Studies Coordinator/Asst. Prof.-Assoc. Prof. American Studies or Humanities; Asst. Prof. American Studies, strength women's ethnic studies; Asst. Prof. Humanities, strength in European/English literature. Contact: Chair, Humanities Department, San Jose State University, San Jose, CA 95912 (women and ethnic minorities encouraged to apply).

Dean of Humanities. Demonstrated academic administrative leadership, record of distinguished teaching and research. Application deadline: February 15. Responsibilities begin as soon after July 1 as possible. Sent materials to : Search Committee for Dean of Humanities, Office of Academic Vice Chancellor, McHenry Library, University of California at Santa Cruz, Santa Cruz, CA 95064.

Tenure-track position for Assistant Director of Women Studies; M.A in Humanities preferred. Ph.D. and experience required. Send materials to: Elizabeth Messe, Women Studies, University of Alabama, Box 870272, Tuscaloosa, AL 35487-0272.

Women's Studies Program Director to administer interdisciplinary program. Ph.D., teaching experience, research, publication record required; administrative experience preferred. Initial screenings begin February 1; applications accepted until position is filled. Send application, vita, and names, adresses, and telephone numbers of three references to: Professor Kathy Staudt, Assistant Dean of Liberal Arts, The University of Texas at El Paso, 500 West University Avenue, El Paso, TX 79968-0525.

Lecture Series

Sponsored by the Interdisciplinary Group for Historical Literary Study and the Department of English at Texas A & M University. February 20--Wesley Morris (Rice University), "Signatures of Place and Time: Faulkner's Historical Vision"; April 3--Stephen Greenblatt University of California, Berkeley), "Chaucerian Commerce: Urban Ideology and Literary Practice." All lectures in Room 204C, Evans Library, Texas A & M University campus, College Station, TX 77843; (409) 845-8356.

Texas Success Story

NAHE member Lincoln King used the money from his 1987 University of Texas Excellence Award for Outstanding High School Teachers to finance travel and study in humanities and arts. A Fulbright Scholarship made possible two months of European study. The result: a first-time ever interdisciplinary humanities course for Gary High School seniors. King's course is organized in six historical periods, each centered about a single city.

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity, humans or people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

THE NATIONAL ASSOCIATION FOR HUMANITIES EDUCATION

CALL FOR PAPERS:

LANDSCAPE, ENVIRONMENTS, AND LEARNING IN THE HUMANITIES

The Spring 1990 issue of **HUMANITIES EDUCATION** will be devoted to the broad areas of landscape and environments, including cityscapes. Topics might include the study of specific places as an index of culture, interactions between setting or background and the main focus in works of art and literature, providing students with a vocabulary and methodology for analyzing environments--among many other possibilities. This issue will also feature slides from the collections of the Minneapolis Institute of Arts with informational notes and ideas for teaching.

As always, articles should relate to interdisciplinary humanities learning from elementary to adult humanities programs. In addition to longer articles (see Editorial Policies), we like to have relevant reviews, abstracts of journal articles, and short pieces describing classroom activities, museum exhibits, favorite documents and artifacts, etc. Selection of articles will be influenced by the need for balance among our many constituencies as well as the usual criteria for accepting submissions to **HUMANITIES EDUCATION**.

The deadline for completed submissions is January 1, 1990. Please send proposals, manuscripts or inquiries to:

HumaNews: The Newsletter of the National Association for Humanities Education, edited by
Vaughn Baker & Darrell Bourque 35

HUMANITIES EDUCATION is published by the National Association for Humanities Education
with editorial offices at the Department of Philosophy & Humanities
University of Minnesota, Duluth, Duluth, MN 55812

The University of Minnesota is an Equal Opportunity Educator and Employer.

VOLUME SIX: NUMBER TWO: SPRING, 1989

STAFF

EDITOR: Fred E.H. Schroeder, Professor of Humanities, University of Minnesota-Duluth

ASSOCIATE EDITORS: Sharon Scholl, Professor of Humanities, Jacksonville University; Susan Coultrap-McQuin, Associate Professor of Women's Studies and Humanities and Head of Women's Studies, University of Minnesota-Duluth

BOOK REVIEW EDITOR: James V. Mehl, Professor of Humanities, Missouri Western State College

HumaNews EDITORS: Vaughn Baker and Darrell Bourque, University of Southwestern Louisiana.

WORD PROCESSING: Anne Hoff , Senior Secretary, Institute for Interdisciplinary Studies, University of Minnesota-Duluth

DESKTOP PUBLISHING: Nancy Olsen, Associate Director, Institute for Interdisciplinary Studies, University of Minnesota-Duluth

SUBSCRIPTION MANAGER: Janet Stanaway, Administrative Secretary, Department of Philosophy & Humanities, University of Minnesota-Duluth, (218) 726-8548

Published by the National Association for Humanities Education at the Department of Philosophy and Humanities, University of Minnesota, Duluth. Subscriptions and renewals are $16 per year. Checks should be made out to NAHE and sent to HUMANITIES EDUCATION, Department of Philosophy and Humanities, UMD, Duluth, MN 55812.
When renewing, please be sure to include your **expiration code** from the mailing label or **enclose the label.**

CONTRIBUTOR INFORMATION

Contributors should consult the Editorial Policies sheet carefully. As will be seen, HE is wide-ranging, quite permissive and has no "party line" in respect to definitions of **humanities, interdisciplinary** and **education**, but the wide boundaries are nonetheless firm. Please do not submit articles over ten pages long unless you are planning to revise.

CONNECTIONS: MATHEMATICS AND THE HUMANITIES

Exploring the relationships between mathematics and the humanities can be stimulating for both faculty and students. That there are connections should surprise no one in interdisciplinary studies, but finding them might prove to be more difficult; humanists and mathematicians have not been involved in extensive dialogue in recent years. Here I will provide a geography of the hunting ground to serve as a guide to the kinds of connections one might hope to find.

The first connection between the humanities and mathematics is the study of the history of mathematics. Contrary to the impression left by most mathematics texts, almost all mathematics was developed in response to particular problems that arose within an historical context. Topics and questions in this category include: Why did the ancient Greek mathematicians emphasize the need for proofs for mathematical statements? Why didn't Archimedes develop the calculus? In particular, what difficulties did the Greeks have with the notion of infinity? What effect did the mathematics of China and India have on the progress of number theory? Why were Arabic numerals introduced in western Europe in the thirteenth century, and what led to their adoption? What led to the development of probability and its acceptance as a tool for making decisions, especially in the twentieth century under such guises as the game theoretic decisions made during World War II?

A second category is the impact of the arts and humanities on mathematics. While most people are acquainted with developments in mathematics that arose in response to questions from the sciences, few are aware that some of the problems that stimulated mathematics arose in the humanities. For example, the development of perspective in painting in the fifteenth and sixteenth centuries inspired the development of projective geometry; one of the first texts in this area was written by Durer. Additionally, problems in ancient Chinese, Egyptian, Babylonian, and Greek religions led to developments in both geometry and number theory.

Many mathematical theories and apparent successes have inspired humanistic ideas as well. Euclid's model of truth and certainty as presented in the *Elements* has been significant in philosophy throughout the centuries. Simply one example is the presentation in Spinoza's *Ethics*. The deterministic view of the world presented by early eighteenth-century physics and the calculus affected certain social and political views which were to emerge later in the century. Models of non-Euclidean geometries inspired several of Escher's prints. Four-dimensional and other non-Euclidean models of geometry proposed as models of the universe had a great impact on artists in the early twentieth century. Godel's results on the incompleteness and undecidability of mathematical theories in the 1930's are only now beginning to influence philosophy and theology.

A fourth connection is found in the use of humanistic tools and ideas to understand mathematics, and mathematicians as well. In mathematics, the best theorems are those of beauty and elegance that contain a surprise. Mathematics research that proves only what is believed to be true is, in general, of less interest than research that proves something unexpected. Mathematicians such as Paul Erdos speak of proofs that are "in the Book"; those proofs that, because of their elegance, simplicity, and clarity, seem to be the most fitting, the most apt proofs of certain results. Mathematicians argue about which basic concepts are the "right" ones. Almost all mathematicians originally chose their field of study because of the joy and beauty they find in the patterns of mathematics.

Finally, mathematics provides a tool for the study of the arts and humanities. Examples of mathematics in music include the analyses of musical forms, discussions of systems of tunings both within western music and in ethnomusicology, and the permutations of serial or twelve-tone music. Analyses of the form, rhythmic structure, and melodic patterns of music from Dufay to Bartok to contemporary composers in terms of the Fibonacci series and the golden mean provide further examples. Steven Brams and Douglas Muzzio have explored game theoretic analyses of theological terms, stories from the Old Testament, and decisions made during the Watergate scandal. And, of course, mathematical considerations of proportion and symmetry occur throughout the study of art. Da Vinci's works and Islamic art are simply some of the most obvious examples.

As an illustration of the use of mathematics as a tool in theology, consider only a portion of the presentation Brams gives in his book, *Superior Beings: If They Exist, How Would We Know?* (New York: Springer-Verlag, 1983). Brams first establishes that interactions of a superior being (SB) and a rational person (RP) can be modelled by a game theoretic matrix. For example, consider the game of Revelation in which SB and RP are players. In this game, SB has two strategies, either to reveal itself, or not to reveal itself. RP can choose either to believe or not to believe. This yields four possible outcomes, each of which is ranked according to preferences suggested for the two players. We may choose to rank the outcomes for SB from most preferred (4) to least preferred (1) in such a way that SB would most prefer belief to non-belief, then non-revelation to revelation. Faith (belief without revelation) would thus receive the highest rank of 4, belief supported by revelation a rank of 3, non-belief without revelation a rank of 2, and non-belief in spite of revelation a rank of 1. (The practice of ranking from 4 (high) to 1 (low) is in accord with other applications of game theory in which actual values, such as dollar amounts, are assigned to outcomes; the higher valued outcomes are then preferable.) A ranking of the outcomes for RP could be assigned on the basis of the assumptions that RP most prefers that the status of belief be in accord with the evidence, and secondarily, that belief is preferable to non-belief. Then RP's first choice would be belief supported by revelation (4), next non-belief without revelation (3), then belief without revelation (2), and finally non-belief in spite of revelation (1). All this information can be neatly encoded in the matrix below, where SB's strategies are marked on the left of the matrix, and SB's preferences for the outcomes are the first number of the ordered pairs within the matrix.

		RP	
		belief	non-belief
SB	revelation	(3,4)	(1,1)
	non-revelation	(4,2)	(2,3)

One can certainly argue that SB and RP might have other priorities in their rankings of the outcomes, but given these priorities the matrix certainly summarizes the results of the preceding discussion succinctly. In order to determine the outcome of the game, notice that SB's strategy of non-revelation is dominant; that is, whether RP chooses belief or non-belief, SB receives a better outcome by choosing the strategy of non-revelation. (As we see from the matrix, if RP were to choose belief, SB would receive his best outcome (4) by having chosen non-revelation, and if RP were to choose non-belief, SB would receive the outcome with rank 2 (better for SB than that of rank 1) by having chosen non-revelation.) Once the players have determined SB's dominant strategy, RP would realize that the strategy of non-belief would provide the outcome RP ranks 3, preferable to that of rank 2. The outcome of the game, as played by rational players, would be non-revelation by SB and non-belief by RP.

Brams next suggests the definitions of certain theological words within his game theoretical presentation of interactions in terms of players, strategies, and preferred outcomes. In game theory, it is assumed that the players choose their strategies simultaneously. Being permitted to choose a strategy after the opponent has selected one should be an advantage. *Omniscience* for an SB could be defined as the ability to know the choice of strategy of RP before SB chooses its strategy. (This need not deny free will in any particular case; if it's a fine Saturday afternoon in May and I have tickets to an OSU baseball game, my wife knows where I will be without infringing on my freedom to choose to be in the baseball stadium.)

If game theory served only to organize information neatly and provide a context for definitions, it would not be a particularly interesting tool. Brams demonstrates that game theory can do more by showing, paradoxically, that there could be disadvantages in omniscience for an SB if RP knows that SB is omniscient. To illustrate this, consider the game of Chicken. In this game, the players are imagined to be on a collision course. Each player has the option of either swerving to avoid the collision or not swerving. The outcomes for both players are ranked from a high of not swerving while one's opponent swerves (4), through both parties swerving (3) and swerving while one's opponent remains steady (2), to a low of neither party swerving opponent remains steady (2), to a low of neither party swerving (1):

		RP	
		swerve	don't swerve
SB	swerve	(3,3)	(2,4)
	don't swerve	(4,2)	(1,1)

Neither player has a dominant strategy in this example. What strategy should RP choose? The best and worst outcomes are possibilities if RP does not swerve; RP can guarantee survival only by swerving. Since the game is symmetric, without any additional assumptions, SB would face the same dilemma. This might easily lead to the (3,3) outcome. But now suppose that SB is omniscient and that RP is aware of SB's omniscience. Then RP can choose not to swerve, confident that SB will know of this decision. SB must then choose between the outcomes of the last column; since the outcome obtained by swerving is ranked higher for SB (2) than is the outcome obtained by not swerving (1), rational play would call for SB to swerve, resulting in the outcome (2,4). This result is both better for RP (4 instead of 3) and worse for SB (2 instead of 3) than was the suggested outcome (3,3) when no power of omniscience was assumed!

What does this paradox tell us? Perhaps that omniscience coupled with one's opponent's awareness of this ability is a disadvantage. Perhaps that this particular game theoretic model of omniscience is too simple. Perhaps that game theory does not provide a rich enough context in which to model the concept. In which category of connection between mathematics and the humanities will further study lead us? In further uses of mathematics to study theology, or in developments in game theory motivated by a problem in theology?

As the questions in the last paragraph illustrate, there are no hard and fast boundaries between the give categories discussed here for connections between mathematics and the humanities. Connections between the categories certainly exist as different disciplines continue to influence each other. One might argue, too, that the history of mathematics is simply one aspect of using the humanities as a tool to understand mathematics. I've chosen to list it separately because courses in the history of mathematics are much more common in colleges than are courses in the esthetics of mathematics.

It should also be clear that this categorization of connections can be used as a paradigm to discuss the relationships of many other disciplines with the humanities. For example, replace mathematics by biology. What are some examples of connections between biology and the humanities? The categories listed here provide a pattern that can help direct such an exploration. (Mathematicians will argue, of course, for the importance of mathematics, as does Judith Grabiner in "The Centrality of Mathematics in the History of Western Thought," *Mathematics Magazine*, 61 (October, 1988), 220-230.)

Finally, discussions of the relationships between mathematics and the humanities also suggest that it is important not to misinterpret Frederick Turner's model for a new academy (in "Design for a New Academy," *Harper's Magazine*, 273 (September, 1986), 47-53.) In it, mathematics is seen as the base of a pyramid of knowledge that rises through physics, chemistry, biology, anthropology, and the humanities to the apex of theology. This model provides a more useful metaphor for the organization of knowledge than does that of disciplines separated into distinct compartments, arranged horizontally. Turner's model should not be thought to prohibit interaction among disciplines simply because they are not in adjacent layers of the pyramid.

Examples from the humanities help me teach mathematics more effectively. Perhaps an awareness of connections with mathematics can assist in teaching the humanities as well.

EXAMPLES, NOT ILLUSTRATIONS; THE ARTS AND THE INTERDISCIPLINARY HUMANITIES

My title is not intended as a semantic tease, but to separate a significant difference. Because the two words "example" and "illustration" are close to synonymous, our real purposes in the Arts and Humanities in education can be confused. "Example"--c.f. "exemplary"--carries a connotation of quality and is more nearly autonomous. The distinction is between illustrations *of* something else and examples *to* us.

Both the Arts and the Humanities would have us experience the particular rather than the typical, and how the subject is embodied in the style. What we examine is "something," a work or an event, whether it is to be experienced first as a whole or only revealed in time. The performing arts and literature require us to experience them progressively; we cannot encompass the whole symphony or novel until we have been carried through them bar by bar or sentence by sentence. Our first vision of a painting will be to see it as a physical whole; it is our exploration of its detail that will gradually compose its aesthetic completeness. The object, the "something," has the status of an event because it is not inert. The poem on the page or the painting on the wall may not really move or alter, but our response to it develops; and in the phrases we use--"it imposes itself" or "it grows on us" or "it reveals new subtleties"--we seem to endow it with a power of action of its own. Even when the work is a parable of stillness, it suggests what is not moving, what has been subsumed, just as silence is not mere absence of noise.

The work of art or literature is defined by its form. Yet as it draws us into its experience, we may have the sense of this perimeter filling and expanding. We discover more *in* it, not about it. An early poem by C.P. Cavafy provides a good instance.

AT THE THEATRE

I got bored looking at the stage
and raised my eyes to the box circle.
In one of the boxes I saw you
with your strange beauty, your
decadent youthfulness.
My thoughts turned back at once
to all I'd heard about you that
afternoon;
my mind and body were aroused.
And as I gazed enthralled
at your languid beauty, your languid
youthfulness,
your tastefully discriminating dress,
in my imagination I kept picturing you
the way they'd talked about you that
afternoon.

The casual tone is deceptive. The poem is not mere anecdote, but a wry reflection on our perceptions of reality. For Cavafy, or the narrator, the play onstage vanishes. The new dramatic event is tripartite: Cavafy, the beautiful person in the box and the gossiping acquaintance are the characters. It moves between three tenses: past gossip, present contemplation and a future in which the creature may shed his or her "tastefully discriminating dress" and behave as word has it he does. Or may not. The decorum at the theatre, actually seen, and the scandal, only heard about, together provoke Cavafy's imagination to this small drama of contradictions centered on a figure who was supposed to be peripheral to the action onstage. The poem does not carry us into an actual future, though that the narrator continues to stare and to rehearse what gossip said, matching image to whisper, suggests that the gossip is excitingly plausible.

The poem also sets up a series of perspectives. We begin with ourselves, reading the poem, and then by association with the "I" of the narrator turn to pick out one figure. A figure remarkable in its presence--and we never find out whether the "I" knew him or her before, or the sex of either--but one which cannot exist in its present alone, but has to be seen down the perspective of what was said. And it is only by looking at the figure before him that the "I" can tend to confirm or deny the existence of that other, faun or satyr, elsewhere enacting the improprieties that gossip grabs at, now so respectably watching someone else's performance onstage. Nor do we know whether the figure is aware of being watched. Nonetheless, he or she is in double focus, a composite of the directed gaze and the remembered conversation.

The poem ends with this fiction--not the simple person, not the theatre--as its obsessive reality; and the narrator's mind has become instead the playhouse for it, restaging what was never in his direct experience. The axis of obsession is between "I/mine" and "You/your"--each set used nine times--complicated by the two interventions of what "they" said. That the poem is addressed in the second person singular suggests that the ambiguous "you" might one day see it, and reminds us that it is a poem, a record. It makes us a part of its pondering resonances with its swaying rhythm matching the narrator's speculations, a pendulum that continues beyond the last line into what we might call our incrimination too.

Cavafy's poem is a useful text too in that it brings together the two groups that concern us, performers and audience (even though the actors onstage get short shrift this time). Arts departments in education still have frequently to justify themselves--"tap dancing their way to tenure," as the gibe would have it. The less specialized Humanities are increasingly at the mercy of a new Utilitarianism. This not only emphasizes the poor job prospects, but, more dangerously, defines the university's role in terms of the immediate technocratic wishes of society. The Arts and Humanities do not always ally themselves comfortably. There is a traditional suspicion of performance as an evasion of learning; while the contrary view sees the mere study of the arts as a poor substitute for the practice of them.

The performing artist has to be dominated by the present; otherwise, he or she stops playing. All that has been learned must be expressed within the duration of the piece. The performer is the best and worst of critics. The best, in that he or she is making the diagram actual, communicating the piece itself, not a commentary on it. The worst, in that the act of performance cannot allow for alternatives; commitment to the moment is all. The artist may be wrong, but cannot be doubtful. The critic, however, arrives at conviction only by taking into account all other possibilities. The truth of the present performance is validated by the experience of past performances. The really great performance gives the illusion of abolishing all competitive recollections, and even later will maintain its due place in the hierarchy of the memorable. Then what should be remembered is not the performer, but his disappearance into the play or music or dance.

Critics and lecturers have no such ideal of self-extinction (nor do many performers). Theirs is a tertiary role if we grant first place to the creator and second to the re-creator. So to the extent that a teacher can bring students vicariously to the sense of actual performance, of the living realization of what has been created, and to sharing, however distantly and imperfectly, in the work of the maker, the gap between act and appreciation can be lessened. The masterpiece is not "typical of its period" or "a difficulty to be approached cautiously in stages"--or sidled past. It should be a lion in the path that cannot be avoided. The more it mauls our understanding, the more worthy we are to confront it.

If our ideal in bringing the arts before nonperformers is to give them as much sense as we can of the work as an involving act, we are still left with the matter of the necessary narrowness of the performer's training. How far should we go in encouraging talent that may be below the level needed to sustain a rewarding career? And can we tell? Young dancers and instrumentalists will have had ten years of instruction behind them by undergraduate age. By then, the most talented should be in professional dance companies or winning piano competitions. The singer's voice, on the other hand, may only just be starting to mature. The theatre major has had no training whatever in speech and movement and no experience of the kind of concentration needed. The visual artist and the creative writer may develop slowly or rapidly or erratically and in greater and more fruitful isolation than the performer. How do the exhaustive demands of studio and conservatory training ever adjust to the university's claims for liberal education, save by compromise? Or is this an implicit recognition that most of the fine arts talent will not succeed professionally; and that a balance of particular practice and general learning will produce avocational artists and good audience members? And (even more *sotto voce)* that exceptional talent will escape or triumph over the well-adjusted regiment of college?

To distinguish the Arts from the Humanities by the element of performance is a dangerous test. It can minimize the value of the text in the one, and limit the sense of realization in the other. The poem read, aloud or silently, is enacting and making eventful a series of vivid complexities just as much as a Beethoven quartet in performance--within its present, with a similar trail of history--even though words refer in a different way from musical notation or brush strokes on canvas. The autonomy of the work is a generous one; it gives each experience we have of it its own rights, however much our later experiences may modify that truth of the moment.

The survey course has incompatible intentions. One is to trace the historical evolution of culture; the other is to examine its individual constituent works. The first intention has to be rapid, linear and selective. It has time only to deal with excerpts rather than examples to give any sense of how we have come to where we are today. The other must to some degree neglect the conspectual plan in favor of particular works. We may caricature the first by saying that the students never really meet a work of art; and the second, by saying they do meet a few, but never discover how and why they got to be there.

Forced to choose, one would have to pick the second as the more important aim; though one would do so reluctantly, given the historical unawareness of so many students. Works of art are not just typical of time and place; the most "typical" may well have disappeared, if not into dust, then into dissertations. So often the introductory textbook in the arts, bland in style, through

1105

in trivia--the produce of a committee of professors writing, consultants amending and editors finicking, rather than the work of an author--and unbalanced in the anxiety to find "what the student can relate to," gives its readers the illusion of knowing more than they can. For the student cannot have the meaning without the experience: without a work of art that is powerfully enforcing responses that may be strange, solitary, baffling, exciting, vulnerable and sheer hard work for the mind.

In the debased coinage of twenty years ago, what was objectionable in the cry of "Relevance!" was less the naivete than the egocentricity of putting one's own intellectual autonomy, if it may be so dignified, at the centre of the universe and commanding all history to relate to it. Current impatience with the so-called canon of great works is similar. We may not care to extol what does not affect us, but to be dogmatic about our blind spots is not much of a challenge to historical consensus. Any canon must be questioned on its own terms: works of art or literature whose identity of form and content stand out as exemplars of a culture. The unease seems to come from the corollary: that the implicit in this is that works from a particular culture or period should be comparable with those of other cultures. It is not enough that they are just the best that some culture has produced, and of which, *faute de mieus*, it must be proud. Nor is the canon fixed in the way that its detractors sometimes allege. When F. R. Leavis catalogued "The Great Tradition" of the novel, he was outrageously far from the canon of his fellows in the Cambridge English School. Later, he and his wife were to revise and enlarge his list in favor of Dickens. Opposition to the so-called canon of ten comes from those with a short time perspective, unaware of the shifts there have been in critical estimation--less of the value of outstanding works than why they still hold their place as we and our times alter. Relevance, if a useful meaning can be recovered for it, means the almost infinite resources of a masterpiece available to us if we look with patience rather than petulance.

Suspicion of the work as example haunts us in other ways too. Thus even a recent thoughtful paper declares

> *Works of art, science and technology of high quality are recognized more by their contribution to adaptive change in our culture than by any intrinsic quality. They are essentially responses to stimuli and as such cannot be isolated from their context.*

Whatever this may say of science and technology, it links itself to a curiously old-fashioned notion of progress in the arts as though intrinsic quality and influence were necessarily the same. What "contribution to adaptive change" could be made by so conservative a masterpiece as Bach's *St. Matthew Passion*, for instance, which was "out of date" to most of his contemporaries when it was composed? Every one of us responds to stimuli; what is significant is that the major artist creates something new that becomes independent of, and perhaps very different from, its beginning impulse. The context that continues to matter is that defined by the work's autonomy.

Ordinarily, we live in a world of mental paradox. Sometimes we want the actual--to be there now, to be part of it. The mass media are hugely expensive in devising the pseudo-moment and the false presence. At other times we want our mental world to be "about" reality: to put it at a safe distance, to explain it, catalogue it, make it manageable in ways that true reality is not, to substitute for it.

Presentation is our ritual magic. It is oriented towards the viewer rather than the truth of the content. It draws extensively on the arts and invents a sub-species of language. The news broadcast is entertainment. The commercial invites us to see our own image in the person relieved from pain or able to afford the new automobile. Presentation intercedes and negotiates an appearance of understanding between two images of varying credibility instead of between a real person and an actual puzzle. As a dean reportedly put it to an instructor, "You should be able to teach anyone anything, whether they want to learn it or not." So student questionnaires on teaching incline to praise those who use plenty of "supplementary materials." (Where is one that rates as highly a rigorous application to the text?) Presentation shifts emphasis from the context that the work itself calls into being to backgrounds to which it can be made to relate. Mere circumstance is offered as interpretation.

We are uncertain nowadays about what we should claim for the self-sufficiency of aesthetic quality lest it be consigned to the margin where it will please, but hardly influence. The object that has, first of all, a use, whether it be simply functional, like a modern office building, or symbolically purposeful, like a medieval church, is the obverse of the same dilemma. When we put an Eskimo tool or a Navaho pot into a museum, it becomes an object of regard, surviving its new "uselessness." Yet an anthropologist may learn as much about the facts of another culture from objects which do not transcend their utility. What we argue on behalf of the example instead of the illustration is that we learn something more from the object's distinctiveness: that its maker's sense of form, released by the nature of the material and the purpose for which the object was made, gives it an eloquence beyond just any item from that culture. It speaks to us, not of fact, but of ourselves.

As academe becomes more and more preoccupied with quantitative research, the accumulation of data can disguise whether or not the problem being examined is significant. If enough questionnaires are sent out, immense quantities of documents are catalogued, tables and graphs compiled, and all are processed by computer, the trivial can be *presented* as important. Yet some of our most significant queries have few records and require most of all from the researcher a plausible imagining--not unlike the artist's. Instead of the mind's risk-taking, whether to venture with Freud into the forbidden catacombs below daily propriety or to try to re-experience medieval drama, not even knowing how much of the evidence was ever there, we try to write comprehensive insurance policies against possible error, with a set of premiums for tenure. Perhaps modern methods of communication will make every fact retrievable. The small green insect that lands on my page as I write is to me an irreverent and intriguing contrast. Enough small green insects, especially if they can be interviewed as well as studied, may make a book.

At the very least, one may add to the bazaar gabble of all those articles which explain the extraneous devices of presentation to teach the work which cannot simply be confronted as itself. Here illustration usurps the role or rule of exemplars. Draw your very own scene from *Hamlet* with computer graphics. What advice would a modern marriage counselor have given Ophelia and Gertrude? Do not create learning situations in which students are likely to make mistakes; find *something* that they can get right. The authors always seem unaware of the tone of condescension towards the student. Meanwhile, the unknowable text stares out like those great stone figures on a remote Pacific island--aloof, mysterious and demanding. But demanding what? The reduction of the complete into a process that never was? A peripheral job-trot with eyes averted? The brilliant comedian, Tony Hancock, with increasing fame shed the various collaborators who had made his success possible. A merciless cartoon depicted his ingratitude, with Hancock saying, "I like God, but it's time for us to go our separate ways."

Practitioners of the arts may well comment that to learn *about* the arts is bound to lead to abstraction. To make or perform oneself, however inadequately, is better than to sit passively as the ghosts of masterpieces past, neatly labelled, flit by. Humanists may retort that performance can debase art as much as explanation can abstract it. An experience of the arts on campus confined to playing out of tune in the band or being prima donna in a college play or meeting last week's New York painter is, at best, a cause for sympathy, but more likely a reason for others to stay home.

Sometimes the uninhibited sense of discovery can--with gifted direction--produce remarkable results. Nothing is yet routine. Arts faculty would do well to forget that favorite cliche--"the right to fail." There could be no more discouraging excuse. I have seen sculpture, ceramics, drawings and prints to grace any gallery; productions of *Hedda Gabler* and *Macbeth* with student casts that renewed the plays. I have even seen and heard a remarkable *Aida*; though the triumph had to be spoiled by voice faculty grumbling about the lessons the singers had missed in their studios by becoming so involved in Verdi's opera.

The value of the Arts to the Humanities, whether our perspective is that of creator and performer or audience, is that they are not transcriptions. The work of art is not a version of something else; it can only be spoken of in the language its maker chose to speak to us. Its presence in our way is singular, and its value may be defined by its least accessible aspects. Yet it is for these reasons that the object or event as experienced may be what connects the ideas of others to the student's own life in deeper and subtler ways than by illustration. We can never say that we have "grasped" a masterpiece, but we may come within reach of it--not by simple equations, but by acts of imagination.

TEACHING CREATIVITY: A COMPUTER USE APPROACH

INTRODUCTION: VISUAL PROCESS THINKING

A well-conceived humanities curriculum attempts to introduce a model of the human being as a creator. This model stipulates that each one of us creates the subjective-objective world in which we live and act, that the creative process is not the exclusive domain of the fine artist--mystical and beyond words--but is a basic human process. My experiences in a university classroom have shown me that we can develop our students' understanding of the human being as creator by giving them projects that integrate computer graphics (the MacPaint program) and word processing (MacWrite) on Apple Macintosh computers. This approach is called *visual process thinking* and brings an added dimension to classroom procedures that are usually based on abstract verbal processes.

The only equipment required for teaching visual process thinking is a computer and a printer, although it is obvious that more elaborate facilities will allow for a more developed final product. In this approach, the computer serves as an electronic visual design studio/workshop. It is basically this technology that allows the creative process to occur in an easy and 'natural' manner. Perhaps for the first time in his or her educational experience, the student has a sophisticated and powerful piece of technology available in the classroom for a creative as well as an analytical tool.

The general teaching methods, ideas, and computer uses described in the pages that follow purposely deal with highly habituated classroom behavior. The approach gently encourages the student to modify old behavioral patterns in new and imaginative ways, through a focus on the power of image-making. Students are encouraged to perceive experiences in new ways and to become more at ease with their individual expressive and creative capabilities.

THE COMPUTER AND THE CLASSROOM

For many college students, their last active engagement with visual processes was an assignment to make a construction paper pumpkin in class for Halloween. Perhaps, the student's next encounter with visual processes was to write a paper discussing the differences between baroque and rococo styles, and the social implications of these differences. I have seen a great many students in museums busily taking notes for assigned papers, as opposed to looking at the art on the walls and the pedestals. This is evidence of the triumph of the verbal processes--how we learn to see with words instead of eyes.

Most of us unconsciously have learned to understand art as a noun--an object or performance to be abstracted into words as rapidly as possible--rather than as a verb--i.e., the creative process or the *art* of making. An opportunity for a deeper understanding of our innate creative process (art being one path of understanding) is therefore denied to many of us. Is it any wonder that our culture, which is confronted with profound human problems, seems so poverty stricken in the realm of new ideas, imagination and creative solutions? The computer is one of the tools that can provide both student and teacher with a fresh chance for active engagement with their creative imaginations. There are at least 17 reasons why computers work well for teaching visual process thinking.

1. **The computer helps students who are extremely self-conscious about their doodles and drawings.** Somehow the visual products generated from the computer seem to have a depersonalized, manufactured quality. Paradoxically, this quality allows for free expression without the usual degree of self-consciousness. This kind of freedom also seems to be increased if the teacher stresses the process rather than the product through positive reinforcement of innovative energy, rather than stressing and rewarding the finished design.

2. **The computer lends itself to abstraction rather than to rendering or photographic realism.** The advantage of this property is twofold: first, the student's feelings of inadequacy as expressed in the statement "I can't draw a straight line" are eliminated, and second, the often hostile question "what is it supposed to be?" is no longer relevant. Furthermore, some of the cultural stigma ("art is a nice hobby but what do you do for a living?") regarding the making of art disappears, since computer use in the classroom is acceptable and indeed highly valued by those involved in the educational system.

3. **The computer as a tool is fast relative to most other visual media, and the feedback is immediate.** It may be that the computer's speed along with the need to attend carefully to its operation contributes in some way to the focussed state of consciousness reported by many computer users. Like other altered states of consciousness, which are usually relaxed and attentive states, this focussed state of consciousness teaches students a valuable and necessary part of any creative process.

4. **The computer encourages risk-taking, trying new approaches, and generally being more adventuresome. It is very forgiving.** Mistakes can be undone, work in progress can be saved at various stages, and duplicate documents can be created to test new ideas. New directions can be accidentally discovered and can be pursued or saved to work on later. Bits and pieces of the work in progress can be stored and used in other visual projects. There is a feeling of control, flow, fluidity, and transformation.

5. **The computer can generate imagery unique to itself.** This characteristic almost ensures an exciting experience of learning by discovery. The computer has the ability to easily produce on command repetitious imagery with slight variations--a task that would require extensive time and effort if done by hand.

6. **In working with the computer all students start with equal electronic tools at their disposal.** To a large extent students' technical skills with the computer (other than programming or word processing) are almost equal. Generally students' knowledge about the graphics program's capabilities is quite similar since little classroom time is given to the computer's visual poten-

tial. However, as the class works together through time, graphic information relating to general computer use in the course tends to be shared and becomes common knowledge. This equality seems to aid in providing a pleasant working ambience for personal expression and exploration not unlike studio art or craft courses at the college level. There is a relaxed seriousness with a decided lack of competition in the room.

7. With the computer, large quantities of random or accidental visual pieces can be rapidly generated and transformed. Many times in the creative process the artist toys with apparently unrelated bits and pieces. From this seemingly purposeless activity he or she somehow perceives and responds in a way that gives direction and form to the finished work. The computer can provide a vast array of this stimuli for the creator, whatever the maturity level. The computer provides a real experience of working with, enjoying and using the accidental.

8. Words and images can be unified in new and unusual combinations. The computer provides countless ways of altering and creating fonts. These altered fonts can become part of visual products, and can transform the meaning of a word or piece of writing, or the whole piece of writing can be abstracted into a purely visual product. There is enormous flexibility of visual-verbal combinations made possible by the computer. New experiences in expression and communication occur more frequently. In my view, the work of William Blake is a supreme example of this synthesis.

9. Color, pattern, and texture can easily be incorporated into computer design. Since the Macintosh has a black and white screen, color must be added to a printout if it is desired. However, the expressive power of color can easily be incorporated by using colored pens or pencils. There is also some visual learning that takes place by combining electronically generated imagery with hand tools, i.e., pens, pencils, watercolors, and pastels. This can provide the opportunity for exploring other kinds of visual relationships.

10. Computer-generated images tend to be contemporary in feeling. The value of this quality is an unconscious familiarity that leads to the student's easy acceptance of the imagery produced. In part due to the omnipresent influence of television, advertising, textbooks, and film in the culture, we have become comfortable--perhaps to some extent subliminally--with electronic imagery.

11. The rapid emergence of software and hardware products provides the opportunity for new uses of the computer, as well as the incorporation of new ideas into the classroom. For example, a digitizer can store three-dimensional objects, cartoons, articles from magazines, posters, art works, or graphic materials onto a disk. Graphics programs can then be used to modify these images. Sound and/or animation can also be added. Special effects such as fade in, fade out, darkening, lightening, and greying the screen can be used. Manipulation of printers, ribbons, type of paper, and scale of product provide freedom for imaginative investigation.

12. The computer provides a vehicle for students' exploration of the process of conscious message communication through image-making. The computer allows the teacher as well as the student to more fully use his or her imaginative message-sending skills. Most of us seem more at ease with creating a written message than a visual message. The computer is an invitation to the teacher to expand the educational process of effective message generation by including visual images. At times, for any teacher or student, there is a degree of anxiety in this invitation. Usually the excitement of the classroom and the expanded learning that occurs for both student and teacher more than compensates for any initial anxiety.

13. There is a potentially playful quality in the creative use of the computer in the classroom. Children learn through play and are very aware of the playful characteristic of computers. They are easily caught up in the "magic" of the machine. The ability to enter this childlike state is usually lost in post-secondary education. The reintroduction to this state can provide a reminder of this essential condition for expression and discovery which is not often encouraged in the classroom. Picasso, a meta-model of the creative process in the twentieth century, said "It takes a long time to become a child." It would be interesting and rewarding to consider the extent to which this childlike state of consciousness is crucial to, although ignored in, the critical or analytical thinking process that characterizes the goals of much of the humanities curriculum.

14. The computer can easily produce a respectable finished product with its word processing and graphic capabilities. The distinction between student work and professional work tends to disappear. This readily gives the student a sense of accomplishment. It also blurs the line between the amateur and the professional, allowing the student to perceive himself or herself not simply as a beginner but as engaged in a maturation process.

15. The computer can relieve some of the boredom that unfortunately occurs at times, even in the best of classes. Confinement, competition, comparison, regimentation, and the threat of grades are not particularly conducive to optimum human learning and the growth of the imagination. The addition of visual creative expression and new uses of verbal processes can alleviate some of the limitations of the classroom environment.

16. Computer use in the classroom provides the potential for an increase in informal learning, i.e., learning which is not covered in the course description. This computer approach encourages the natural expressive use, familiarity, mastery and psychological integration of sophisticated technology as a humanizing tool. A mastery and understanding of technology would seem to be an essential contemporary survival skill.

17. Computer use as indicated in these activities provides practice in "right-hemisphered" brain activity. While vastly oversimplified, the idea that the brain's right hemisphere is primarily involved with pattern recognition and visual processes and the left hemisphere is involved with verbal processing is a fairly well-accepted model. Computer use for visual process thinking will introduce more right-hemisphered activity in the classroom.

1112

SAMPLE EXERCISE:
Haiku Poetry

Preliminary work

This exercise would be done after introducing the class to the value and beauty of working within the precise and limited form of Haiku. This Haiku exercise was assigned to a class that was currently reading *The Bell Jar* by Sylvia Plath, the story of a writer-poet and her rather tragic youth with which the students seem to identify strongly.

Form

Students are asked to write at least one Haiku poem. They are required to follow the five-seven-five syllable structure which is the structure of the poem. For example:

Figure 1.

Using common experience as subject matter:

Going To Work

Swaying subway car
making us distant sleepers
on the ride to work.

Play

structures
systems
play, puzzles and games
solve and resolve
cops and-
robbers

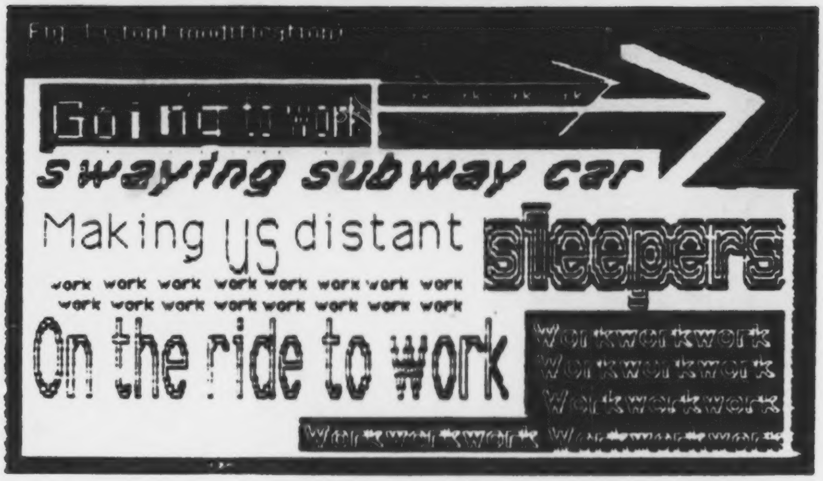
Content

The subject matter for the poem should be a situation encountered in daily college life e.g. getting to school in the morning, exams, 'partying,' doing laundry and so forth. This category of subject matter allows for an enjoyable sharing of common experience and the general enhancement of the classroom ambience which is highly desirable when exploring new computer uses. It also directs the student toward a more sensory rather than abstract use of language, which is a basic goal of mine in working with students.

Visual format

The computer's graphic capabilities bring vastly increased possibilities for understanding the uniquely personal nature of 'expressive communication.' Font size and style can be changed to 'fit' the form and feeling of the poem generated. For example, in the Haiku, the font size could increase as the number of syllables increases, and decrease correspondingly, or the size of words could increase in relation to their impact and importance in the poem.

The style as well as size of the letter characters used can change in the poem. For example, if the subject matter of the poem is 'choppy,' 'energetic,' 'dark' and 'chaotic,' (such as getting up in the morning or going to work is for some of us), then each syllable, word or line of the total work could be written or drawn with the help of the graphics program, in a different 'nervous' style. Each word of the poem can be visually formed to enhance its meaning and impact.



Going to work
swaying subway car
Making us distant
sleepers
work work work work work work work work
work work work work work work work work

Sunday
SUNDAY
HOLIDAY
SILENT ALARM
DRIFTING
FLOATING CARE-LESS
DRIFTING
DRIFTING
TIME,
OF LONG SLOW
DAY
day
Monday

Rationale and Supporting Ideas

In terms of the creative process, this exercise uses the imagination, problem solving, and 'whole brained' thinking. This type of exercise teaches students how the limitations of form lead to new discoveries and transformation by demanding that the student access stored data not usually available to conscious awareness. The process teaches a new way of seeing the ordinary (words and/or common experience), which is, of course, one definition of creativity. Finally, through this exercise students gain an understanding and acceptance of their own creative strategy (style) as well as that of others within the class and become aware that this strategy can be enhanced and carried over into other areas of experience.

Modifications

1. This exercise could be expanded to include Tanka (five, seven, five, seven, seven syllable form) or Cinquains (two, four, six, eight, two, syllables) or perhaps have the student design their own forms, i.e. two, two, four, four, two syllable.

Figure 2

Tanka, using everyday experience as subject matter

Getting up in the Morning

Winter morning light
sunless gray cold house, coffee,
dreams gone, day begins
winter night warm, sleep returns
spring visions, summer sun shines

Figure 3

Cinquain, describing an average weekend day

Holiday

Sunday
Silent alarm
Drifting, floating, care-less
Day of long slow time, quiet joy-full
Monday

2. To personalize the experience, a student could count the syllables in his/her name and make a 'self portrait' using the same number of syllables in the first line as is in the first name, next line using syllables in last or middle name and making the total work as many lines as there are letters in the whole name.

3. An interesting exercise might be to take the finished work and modify its meaning or expressive quality by altering the font and style. With graphics the poem could then be 'framed' using a design that is integrated with the content of the poem.

4. The poem could be left untouched and the title (an important element of the exercise) the only modified portion. The purpose would be to change the meaning of the poem through the change in the title both verbally and visually.

5. In an abstract approach involved with pattern recognition, symbolic form, nonverbal expression, and visual design the whole process could become a form of visual thinking--image making. An example of this could be to take the Hauki form (5,7,5) distort the written material into an abstract shape so that the words are not recognizable, and then use these shapes, i.e. five of one type, seven of another, and five of a third type, to design a total page of pattern. This could be done with the title as well. To create more interest on the patterned page each little cluster could be modified slightly using the many choices available with the graphics program.

6. If a digitizer is available, images could be collected from books, magazines, and photographs and reproduced onto a disk. These images would then be transformed with the graphics program and a representational design could be produced. If photography is stressed or available in the course, the same assignment could be done using only photographs taken by the student for the particular poem. This could be a useful exercise in a communications course, particularly if Polaroid cameras are available.

HUMANITIES EDUCATION
CONNECTIONS

Ideas and materials for better teaching and learning in the humanities.

Sharon Scholl

HUMANITIES AS AN ENRICHMENT PROGRAM

One of the most successful and longest lived (more than 25 years) Humanities programs in the Southeast is conducted in Jacksonville, Florida, via partnership between the Duval County Public Schools and a local Kiwanis Club. Their original model was the Joe Berg Science Seminars which were begun in Skokie, Illinois, in 1955, the idea spreading across the country by the 1960's. Local leaders created the innovation of a parallel Humanities Seminar meeting under the same format on a separate time schedule, thus allowing the few who qualify to attend both presentations.

The rationale of the seminars is straightforward: to provide bi-monthly evening enrichment programs for high school students with intellectual talent and curiosity. The twelve meetings over the course of the school year are conducted by scholars, writers, performers, curators, and other professionals in the disciplines of philosophy, literature, anthropology, history, and the fine arts. The whole design is based upon a two year cycle, at the completion of which the student receives a certificate. The seminars are not offered for high school credit, but occasionally a student receives college equivalency credit at selected institutions. Since local high schools disbanded their credit Humanities courses (which were used as alternatives to senior English), the role of the seminars is especially critical to the educational program.

Responsibility for the content, speakers, and administration of the Humanities Seminars lies mostly with the local school system. A teacher or member of the supervisory staff is assigned to conduct the selection of students, contact and secure speakers, maintain attendance records, and inform the advisory board of plans in progress. General supervision is exerted by an advisory board composed of faculty from three local universities and members of the Kiwanis Club. This latter group provides funds for a banquet to honor students completing the two year cycle.

Students are drawn from high schools throughout the county and meet in centrally located host facilities. Until last year they were juniors and seniors; however, conflicting social and academic demands on seniors persuaded supervisors to relocate at the sophomore and junior level. Students' admission to the program begins with their being recommended by a teacher or guidance counselor. Their school records must include a B plus average and a score of 90% or more on the Stanford Achievement Test. More specifically, students must pass a rigorous exam constructed for their grade level consisting of Western literature, history, philosophy, and the fine arts. About fifty students survive this process to become members of the Humanities Seminar. They are all college bound and represent a great diversity of future academic majors.

The instructional format for the seminars differs from that of a classroom in several respects. There are no textbooks or assignments to be completed and graded. There used to be a term project, but this element proved either unworkable or educationally marginal. Meetings take place at varied cultural institutions and feature a wider range of activities than a classroom could mount. One purpose of the seminars is to lay the foundation for lifelong participation with museums, concert series, art exhibits, etc. Even here certain selectivity must be exerted by seminar planners. An exhibit called "The Nude in America" would probably be objectionable to the parents and not worth the resulting political difficulties. There is no natural sequence of studies; each meeting is a complete unit in itself. Perhaps the best way to think of the program is as a series of explorations.

Individual seminars are so varied and intriguing that sometimes parents who drive their children to the site stay to enjoy the program. The 1987-1988 school year scheduled the following events:

> **Music**: a sound-lecture on the nature of jazz, and the dress rehearsal of *The Messiah*
>
> **Art**: an illustrated lecture on the visual elements; an art museum tour; an architect's analysis of local historic architecture
>
> **Theater**: attendance at *A Streetcar Named Desire*
>
> **Philosophy**: a lecture on Socrates by a philosopher
>
> **Literature**: a talk on television criticism by a newspaper writer, and a lecture on African writers

Other years have included visits to the Ramses II exhibit, symphony concerts, the Jazz Festival piano competition, the Florida Ballet dress rehearsal, and talks on the Battle of Olustee, universal concepts in history, and the restoration of the Sistine Chapel ceiling. It is, perhaps, a "grab bag", but one containing some of the most creative people and key cultural institutions of the area. The seminars are a mixture of direct experience and thoughtful reflections on what such experiences mean. The main key is the willingness of the school system to commit staff time to the project. Significant contributing elements are the energy and funds of the Kiwanis Club and the university faculty who serve as advisors. Any community with sufficient cultural resources could sustain such a program. The long life of the one in Jacksonville indicates an enduring student interest in such intellectual opportunities.

(Davron King Cardenas and Tad Shuman of the Duval County School Board, 1701 Prudential Drive, Jacksonville, FL 32202, are the persons to contact for more detailed information.)

Jill Martin

CLASSICAL LITERATURE IN A NON-CLASSICAL TIME: ANCIENT IDEAS AS A SOUNDING BOARD FOR THINKING AND WRITING

The pendulum has swung, as pendulums will. Textual analysis is no longer the only basis for classroom discussion. Events outside the classroom have bearing on our curriculum in the Humanities. Study of ancient literature can promote a discussion of modern problems and a process approach to writing. Additionally, involvement of disinterested students in the learning process is a question of paramount importance today. To interest these students I apply a holistic approach when teaching Greek and Roman literature and culture to high school students. Research indicates that students assimilate more material through whole language techniques integrating writing and reading (Atwell, 1987 and Squire, 1983). Students retain more information when they are involved in the subject. Involvement is more likely to occur when the teacher acknowledges different learning styles by presenting material in a variety of modes (Dunn and Dunn, 1978). I use a method that addresses these concerns, allowing students to see that ideas of the ancient Greeks are relevant in the 80's.

By incorporating discussions comparing contemporary society's problems to those of Greece, Rome or the Renaissance, humanities teachers do two things at once. We show detractors that study of the past has value to modern students, and we show students the same relevance, answering the question, why take the course? How does my approach differ? As in the past the teacher still serves as mediator--promoting discussion, and eliciting student opinion. However, this time I act as arbitrator and add my opinions as well. Reading content remains the same but daily lessons become more flexible as student ideas and comment determine the direction.

This active approach to literature allows me to express attitudes and feelings toward the object of study. For example, at certain places in reading literature or listening to drama, I want to stop the action. I know what will happen, yet I hesitate out of fear that it will occur. This attitude I compare to the "fear" Aristotle speaks of in *The Poetics* as a part of catharsis in his definition of tragedy. Using *Oedipus the King* as an example, my desire for hesitation appears when Jocasta urges Oedipus to stop his search for his past and he speaks slightingly that she is afraid he is not of royal birth (*Eight Great Tragedies*, p. 82). I always want to stop the action there are tell Oedipus to watch what he says. Perhaps this time I won't have to re-live the pain at the plot's end when he returns to speak to his children and Creon.

An integrated approach toward teaching literature invites me to pause, to half the

1119

play in order to tell about my worry concerning Oedipus and Jocasta. I think as teachers we must help our students develop empathy by our emphasizing the emotions and ideas engendered by a piece of literature. Since Aristotle, literary criticism has validated audience reaction as an appropriate response. Such reaction should be encouraged in students. If I need to offer further evidence of the value of emotional interaction in motivating students to learn, I cite Sylvia Ashton-Warner's book *Teacher*, in which Maori children learn the alien British culture through emotional involvement. Besides having historical approval as a means for learning, this approach also establishes a base on which a discussion can be started. Does the class feel the same emotion as I do? How do their feelings differ, and where in the play do they perceive the emotional high points to be? Do they fear for Oedipus as they see/hear the ironic speeches? What are their reactions to other lines such as these about the killer of Laius whom Oedipus has declared outlaw:

> ". . . If, with my knowledge, in my house
>
> He harbour at my hearth, on mine head
>
> Fall every imprecation here pronounced." (p. 63)

Do students feel Oedipus is tempting fate? Again Oedipus stubbornly proceeds to learn of his birthright as he says,

> "Go, someone, fetch the herdsman? Let the Queen
>
> Enjoy her pride in her fine family!" (p. 82)

Do the students agree that the irony lies in Oedipus's misjudging the Queen's motives in urging him to stop? Can they think of comparable examples of lack of communication leading to destruction? Oedipus ascribes Jocasta's leaving him to her female pride in family. Is he a male chauvinist or just a poor listener? Are we now more sensitive and do we communicate better than in the past?

I ask students what other statements in *Oedipus* cause an emotional reaction. In a sharing classroom atmosphere I am amazed at the open admissions that result. The teaching is more demanding than rote textual analysis, but also much more satisfying. Such discussions don't remain centered on *Oedipus*, but in a "planned digression" classes have talked about a variety of topics: school, death, politicians, and religion, or the afterlife. A common bond for all these disparate topics is their emotional impact. In each one the students volunteer their position--they take a stand and I add my ideas as well. As an involved teacher I must speak out. In psychological jargon my silence (letting the text speak for itself) is the equivalent of "enabling," letting the students develop thinking skills. I tie the curriculum of the past to the present, hopefully presenting the historical perspective so students know what Sophocles meant. I include philosophy and history, art and music in exploring these ideas. Presentation techniques include oral, visual and kinesthetic methods. But I must go further, showing the situation in my terms--moral judgments and modern interpretation included. The Greek view of the interaction of humans and gods is compared to the Judeo-Christian values of our time. Drunkenness, overeating, slavery, homosexuality and drug use are topics of concern the class has discussed.

I try to follow the discussion with a written assignment somehow related to the topic and argumentative or persuasive in nature. I present no list of appropriate topics ahead of time because the nature of the assignment changes. The sharing of ideas in humanities class is similar to a brainstorming session, and class results are unpredictable but always of value. A short list of writing topics I have used includes persuasive papers on the validity of the prophecies in *Oedipus* and a comparison of Jocasta and Antigone as forces in the unfolding character of Oedipus in Sophocles' trilogy. I have received both narrative and persuasive papers explaining the myth in modern terms. In discussion and analysis of other Greek dramas, a favorite character is Clytemnestra, who has inspired papers on duty, equality, and mother love. Topics from class discussion also lend themselves to papers of inquiry and research. Could a modern prosecutor defend either Orestes or Clytemnestra on the grounds of insanity? Does either Orestes' or Medea's mental condition correspond to modern symptoms of mental disease? Notice that these paper topics begin with a knowledge of the text, but use it to present ideas in the students' own purview.

In this way the study of great ideas of the past becomes a springboard to student expression of their concerns. I utilize the inquiry process to train student thinking skills while cutting across boundaries separating reading and writing.

SUGGESTIONS FOR CLASSROOM MANAGEMENT

1. Choose material with an emotional impact. Be sure students read the material before discussions.

2. Establish a classroom tone of respect for ideas.

3. Give frequent feedback and clarification in discussion.

4. Discuss in groups of changing size and personnel.

5. Keep a written record of discussion on board or distribute written results of group discussion.

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

CHEERFUL CRICKET

An Annotated Bibliography of Timothy Leary by Michael Horowitz, Karen Walls, Billy Smith (Archon Books) 305 pp., $37.50. Review essay by Mel Seesholtz, Penn State Ogontz Campus.

One publisher's "review edition" which recently crossed my desk was a bibliography. Most of the time, bibliographies go into pile #2. They usually don't make thrilling reviews or popular reading.

This one is different. It is insightfully annotated, marvelously illustrated, and thoughtfully published on my 38th birthday. But the real lure of this volume is the name under *An Annotated Bibliography of.* That name has been an attention-grabber for three decades now, from Harvard University to Folsom Prison to Silicon Valley: a name and personality with which many of my fellow thirtysomething and fortysomething baby-boomers immediately identify. *An Annotated Bibliography of Timothy Leary* helps explain why.

SET and SETTING

The first bibliographic entry--following the pentagon of a Foreword by Allen Ginsberg, a Preface by Timothy Leary, an Introduction by Frank Barron, the Acknowledgments and Editors' Note--is "A Drama in One Act," by Harold Cooperman and Timothy F. Leary, entitled *Prelude to Nothing* (1942). It is followed by some 1500 published "somethings"--words and deeds which, to varying degrees, have been part of the life experiences of virtually every reader.

A New York late Beat, early psychedelic poet and a University of California psychology professor frame a Preface by their subject who wonders "Can it be true that we are, each of us, quantum-units defined by our interactions, continually being shaped by the fields of interplay which we inhabit?" This "psychlotronic" triptych is juxtaposed with Acknowledgments to B & L Rootenberg Rare Books and the Fritz Hugh Ludlow memorial Library (among others), and an Editor's Note which begins: "Dr. Leary's varied career as social scientist, activist philosopher, man-of-letters and entertainer; the ephemeral nature of many of his academic and underground publications; and his interest in alternate forms of communication (records and tapes, films, software, etc.) have sometimes posed interesting bibliographical problems for the compilers of this work."

An Annotated Bibliography of Timothy Leary is a thoroughly researched and thoughtfully arranged panorama of one man, who is himself a multimedia, microcosmic reflection of us, the relativistic roaring 20th century, and our "why's" and not-so-wise attempts to evolve in the Information Age.

"I have been swept along by an evolutionary wave, enjoying the surf, feeling great about the surging motion which was surely moving us in the right direction, but still uncertain about where we were going," writes Dr. Leary about Timothy Leary in the Preface.

"There is one word which describes this genetic process of which I have been a passive, unwitting part: interaction."

For all those who would agree, there is an equal number who would take umbrage with Dr. Leary's "right direction" and "passive, unwitting part." But that is for history to decide. Michael Horowitz's bibliography documents the interactivity that has already occurred, objectively.

What immediately strikes even the casual browser of the bibliography is that media controversy has tended to ignore and obscure the fact that Leary is one of the most influential, prolific and versatile writers of our times. He has written over 30 books, including five autobiographies, five textbooks and scholarly monographs. There is one novel, a science fiction thriller called *What Does WoMan Want?* (which is currently on reading lists in undergraduate literature and humanities courses), three comic books, and several screenplays and one-act plays. His writings are currently available in Arabic, Dutch, French, German, Italian, Spanish and Japanese.

He has written influential reviews of the works of writers he admires--Mark Twain, James Joyce, William Burroughs, Aldous Huxley, Hermann Hesse, Thomas Pynchon, William Gibson, Jayne Loader, many of whom are among his closest friends. The annotated bibliography will have to be updated to include, among many other things, one of his current projects, a textbook tentatively entitled *Culture Shocks: The American Literary Scene 1950-1990.*

Few people realize that he has authored over eighty scientific and scholarly essays, in addition to several hundred pop-press articles personalizing and humanizing scientific and philosophic, individual and cultural themes: "Patterns of Social Interaction and Their Relation to Personality Structure: and "How to Win the God Game," "The Individual in the College Community" and "The Big Boom Theory."

Through four decades and several generations, alternating glorification and demonization, across multiple media languages, those themes have remained provocatively consistent. This surprised even Leary, who is similarly tagged "unpredictably independent" by friend and foe alike. "Reading this book has taught me a lot about myself," he reflects in the Preface. "Reviewing this list of published transmissions spanning a period of some forty years I see a clear pattern of thematic repetition that is almost robotic. I am humbled to see that I have been a cheerful cricket in a summer garden scraping out one unchanging note."

One of the latest intonation of that note is his recent "Just Say 'Know'" campaign, which coincides with the 1988 publication date of the bibliography and his interactive "courseware's" first use in college classrooms. The "Father of Humanistic Psychology" and advocate of mind-expansion is producing the next generation of interpersonal courseware.

What reader and re-searcher alike quickly realize through this chronologic re-view (cross-referenced by medium and subject) of the writings of Timothy Leary is that the interpersonal interactions of this Renaissance man did much to define the generational "mind-fields" within which we all live, work and play.

In the "Preface" to the bibliography, Leary himself underscores that consistency: "THIS BOOK IS A CATALOG OF IDEAS ABOUT INTERACTION WHICH THOSE BORN IN THE 1920S (IN AMERICA) INCULCATED INTO AND SAW REALIZED THROUGH THEIR CHILDREN," in the 50s and 60s. And the children of the children of "The Fifties and The Sixties" are the college students of the late 80s and the 1990s, who often meet Timothy Leary in "required reading" in their classes.

For them, their professors, parents, and all who live in this most volatile and fickled of centuries, Michael Horowitz's *Annotated Bibliography ofTimothy Leary* is an invaluable tool for understanding the modern American persona, from "the cold war" and the hot one in VietNam to the "war on drugs," from William Burroughs and Robert Heinlein to William Gibson and Salman Rushdie, from the Beatles and Woodstock to digital synthesizers and MTV, from LSD and Watergate bugs to MAC and computer viruses, from flower-power and hippies to megabytes and hackers. And for understanding (or at least attempting to understand) one of the major figures and driving forces in all the above.

Michael Horowitz was born in 1938. He met Timothy Leary in the summer of 1970, when Dr. Leary was facing 30 years in prison for a small amount of marijuana. His co-editors in this project, Karen Walls and Billy Smith, were born in 1952 and 1951, respectively. Together, they produced annotations which make the volume a practical tool for today's re-searchers and searchers alike.

SOUND GODS

A Song of Love and Death: The Meaning of Opera by Peter Conrad (New York: Poseidon Press, 1987) 384 pp., $19.95. Review by Raeder Anderson, Western Michigan University.

Opera is the most daring art; it expresses aspects of human experience no other art has the courage to address. So writes Peter Conrad in his eloquent inquiry into the meaning of opera.

Conrad, a cultural critic, organizes his book into three principal sections: rite, repertory and performance. The Australian-born author, who has taught English Literature at Christ Church, Oxford since 1972, states opera is a mystery and the "song" of irrationality, where the human voice (which he describes as a demon inside the late Maria Callas) is glorified. Moreover, Conrad's comprehensive discourse on opera identifies violence in German opera, ebullience in Italian opera and a propensity for lucid speech in French opera.

Conrad's most persuasive chapters are on "Verdi," "Wagner" (whom he describes as a true revolutionary) and "Wagnerism in Strauss," but in his succinct chapters, "The Ecstasy and Agony of Song" and "Archetypes," he cannot resist discussing conductors, stage directors and, of course, singers; he claims "singing" opera is more than the production of a voice; the instrument is the entire organism with the air resonating from the diaphragm up to the head making the singer a pillar of sound, a god.

Conrad equates Wagner's *Parsifal* to Verdi's *Requiem* (which he calls a secular mass); Verdi adjusts Christianity to a tearful world; Wagner reinterprets Christianity as autobiography and makes it the messianic glorification of that art. For Verdi, Conrad writes, there is no god, so music must fill up the absence; for Wagner there is no god, so he must personally assume the role. Opera is seditious in its origin; religiously in the pagan worship of Monteverdi's *Orfeo* of the seventeenth century and politically in the revolutionary thrust of Wagner in the forging of Siegfried. The author states that Phillip Glass and Karlheinz Stockhausen have forged new theologies in the twentieth century. Conrad's recounting of Jon Vickers vis-a-vis Benjamin Britten is superb.

Conrad approaches opera not as a musicologist, performing artist or meddling academic and avoids prolonged discussions of music theory, form or vocal technique. Therefore, his book is accessible to those interested in interdisciplinary matters. While he teeters precipitously on the verge of supreme opera buff, Conrad writes with a literary wit and penetrating intelligence which makes this book most appealing. Peter Conrad's other books include ***Romantic Opera and Literary Form***, ***Imagining America*** and, most recently, ***The Everyman History of English Literature***.

RED SHOES

"*The Red Shoes* Revisited" by Adrienne L. McLean in *Dance Chronicle* 11:1 (1988). Marcel Dekker, Inc., 270 Madison Avenue, NY 10016. $35/yr.

It is forty years and more since the British film *The Red Shoes* transformed ballet into box-office, young girls into aspiring ballerinas and post-war fashion toward ballerina skirts. It has survived well, being ranked by *Variety* as one of the "All-time Film Rental Champs," and it certainly influenced some of the great MGM musicals by sanctioning long ballet dance sequences such as Gene Kelly's "An American in Paris" and "Singin' in the Rain." One dance critic has said "there really is no other ballet film," but the star, Moira Shearer, disliked the film, was dissatisfied with the ballet, had contempt for the script and believed that the fame that came to her as a twenty-two year old ballerina injured her career. Ambivalence is part of the aesthetic revisit in this article.

The envelope story is a straightforward realistic movie, which immediately makes *The Red Shoes* different from musicals, where unrealistic song and dance are interwoven with a story line. There are snippets of beautifully danced ballet fragments (*Swan Lake*, *Giselle*, *LesSylphides*, *Coppelia*), but these tantalizing bits are illustrative parts of the story of a ballet company's work. Work is one of the themes, and the film tries to show how practice, sweat, quarrels and props behind and before the scene lead to the magical experience of dance for the audience. Some people think it's a fair representation in *The Red Shoes*, others that it's a prettified version. Another theme is the romantic notion of the conflict between Art and Life. The true artist must sacrifice life to art, and this the Moira Shearer character does literally; torn between art and love, she kills herself. This theme comes through to general moviegoers, but, McLean argues, the more carefully you examine the film, the real motives are all about life and not much about the conflict.

Many viewers are intrigued by the "process-story" of *The Red Shoes*, watching step-by-step as the idea of a Hans Christian Anderson tale takes shape as a new ballet. We see the composer at work, the choreographer, the dancers, the orchestra--and finally the ballet. But the ballet would be impossible to stage. It is pure, fantastic cinematic art with effects that can only be produced by cutting, multiple cameras, trick photography and close-ups. This bothered critics in 1948, it bothers many today, yet there are justifications. The envelope plot may be realistic, but it uses cinematic vocabulary from the beginning with symbolic cuts, dissolves and very beautiful photography. In addition, throughout the film we are following the mind and emotions as well as the career of the ballerina, and the ballet sequence is not really what the audience sees; it is what the ballerina *experiences*, which is partly self-recognition that as the fairy-tale red shoes compel the girl to dance to destruction, so she has been caught in the compulsive "religion" of the dance world.

For students of dance, of cinema and of popular culture, this article is a compelling history. (F.S.)

CLOCKWORK + CHARM

"The Metaphor in Science and the Science Classroom" by Paul G. Muscari in *Science Education* 72:4(July 1988). John Wiley & Sons, 605 Third Avenue, New York 10158. $77/yr.

Metaphor is the essence of the language of poetry, but during recent times in science metaphors were regarded as a "decorative form of literal description, a relieving side show, a disguised joke, or simply a category mistake." This view is changing with changing understanding of the nature of science. Science is no longer seen as objectively pure; changes in scientific theory change the meanings of scientific terms; some scientific concepts are impossible to convey through unmediated language. As with The Kingdom of Heaven and other intangible concepts of spirit, we need Black Holes and Big Bangs for meaning.

There are differences, says Muscari, a professor at SUNY Glen Falls. The arts use metaphors and symbols with an acceptance of the ultimate unknowability of the realities they describe, while science is "more disposed to discovering the regularities that are out there...forcing the metaphor to work within a problem-solving methodology." Boyles' metaphor of the universe as clockwork is of this type. Also, in the arts we insist upon active, lively fresh metaphors; in science, when a metaphor dies as metaphor to become a technical term without connotations, it is a triumph rather than a failure. Chemical *messengers*, *charm* and *antimatter* are examples of triumphant dead metaphors.

In the science classroom, metaphors can help students to develop "concept maps" out of the fragmentary experience of day to day learning. There are cautions, of course. Even the most famous metaphors of moral communication (such as the prisoner in Plato's cave) become for many the reality." As the metaphoric expression "becomes increasingly explicit the hold on imagery must gradually be released." (F.S.)

GOODBYE COLUMBUS

"The Certainty of Columbus: Some Recent Studies" by John Larner in *History* 73:237(February 1988). The Historical Association, 59A Kennington Park Road, London SE114JH. 20 British Pounds/yr.

The Columbian Quincetenary is coming up fast and we humanities teachers should be well prepared. However, if we begin by asking what we know for certain, the news is not good. It is fairly certain there was a landfall on Haiti (not the Dominican Republic) in 1492.

That's about it.

Was it a discovery? Was it a "first"? Was it an Event? We hardly know. Historians of the "Annales" school deny any great persons or events, so the discovery of America was really a groupie unfolding of four to ten centuries, not an event of 1492. Even ignoring the questions of Viking voyages, English or French fishermen, Portuguese castaways or Chinese adventurers, the interaction of what we call the Americas and the Old World was a long-term if sporadic happening. More important today is the question of whether it was the Good Thing of 1892's celebration or the Bad Thing of 1992, which says that the "Columbian Invasion" brought racial holocaust by way of murder, rape, enslavement, economic exploitation, military and technological subjugation in two continents. A Chinese historian in 1977 titled an article "Columbus, the Colonialist Pirate." Columbus' aim, he said, was to invade and conquer China (he could have added Japan, and it led to looting of "Indian" resources, degradation of the indigenous peoples, not to mention the mass enslavement of African as well as Amerind peoples. And reading what documents we have of Columbus' ventures in these lights produces nothing but confirmation. Some celebration.

Still, there is the marvel of the man, the great navigator who against all odds persuaded Isabella, the new conqueror and Queen of Iberia, of a visionary scheme that revolutionized human concepts of the globe. This is nothing that Leif the Lucky or storm-tossed Irish monks or proto-communist Chinese explorers can lay claim to. Unfortunately, Columbus' uniqueness is also in the balance. "The Certainty of Columbus" is the title of this wide-ranging review essay by Larner, an historian at the University of Glasgow. The "certainty" has to do with the evidence that Columbus seemed to know precisely what he would find. The explanations of certainty are at least romantic, and sometimes bizarre. Least romantic is the durable story that Columbus was a Renaissance humanist, an intellectual collaborator with the Florentine geographer Toscanelli. More romantic is "The Unknown Pilot," a Columbus guide of some venerability but now refurbished. It seems that a Portuguese ship was blown to the New World, sailed back to be rescued by Columbus, and the pilot provided directions on his deathbed for Columbus.

If that is too tame, there is the theory of Dr. Perez de Tudela that Columbus came upon a canoe full of Carib women and children near the Canaries in 1482 (give or take). These Amazons were apparently on a colonizing trip and wandered some 1800 miles off course. Columbus learned their language; thence his certainty as ten years later he "discovered" China.

There's more: Columbus' last work was *The Book of Prophecies* in which he declares himself as the new Messiah, dedicated to Christianizing heathens of Islam before the end of the world (due in 1656).

Sic transit gloria mundi. Goodbye, Columbus. (F. S.)

1128

KIDS' ART

"The History of Attitudes Toward Children's Art" by Jo Alice Leeds in *Studies in Art Education*. 30:2 (Winter 1989). NAEA, 1916 Association Drive, Reston, VA 22091. $25/yr.

In a recent *New Yorker* cartoon, a schoolteacher looks up from her desk to see standing in the doorway a crayola drawing of a woman with round head, red cheeks, trapezoidal skirt, etc. "Mrs. Jones!" says the teacher, "I recognize you from Tommy's picture." The situation is ridiculous, of course. Children's drawings are poor substitute images of reality. Yet we are given an anecdote of Pablo Picasso pondering an exhibit of children's art, and saying to the British critic Herbert Read: "When I was the age of these children I could paint like Raphael. It took me many years to learn how to paint like those children."

Is there any reconciliation between the two views? Not really, says Leeds, who is at the University of North Carolina at Greensboro. The controversy is hot and nearly unequivocal between proponents of child-centered education who celebrate the child's freedom from stultifying conventions of art, and the proponents of "learning *about* art, its history, aesthetic and social meaning from an adult point of view." American art educators are generally of the first type, but recent pronouncements of projects of the Endowment for the Arts and of the Getty Foundation turn away from "first-hand creative experience" as the way into artistic learning. The history of the controversy is not long. It could hardly be, for the history of childhood itself is short. Rousseau's *Emile* is virtually the beginning of the idea that childhood is a distinct state of being. Leeds finds nothing of consequence on child art until the 1890s. Some of this is sentimentally romantic, some condescending, but there is a sense that childish scrawls are not merely technically untutored, but reflect a different way of perceiving reality. Carrado Ricci in 1887 was least judgmental, seeing a connection between children's visual expressions and verbalization. Children try to reproduce "man and things...with literal completeness and not with a view of optical results. In short they make with signs the same sort of description they would make with words."

Another positive attitude toward children's art was developing only a decade or so later. The secession painters of Vienna and the German Blue Rider painters were fascinated with children's art as a model for true immediacy in expression. Paul Klee and Wassily Kandinsky were two who wrote of the child's ability to express "the inner sound of the object." (F. S.)

CALL FOR PAPERS:

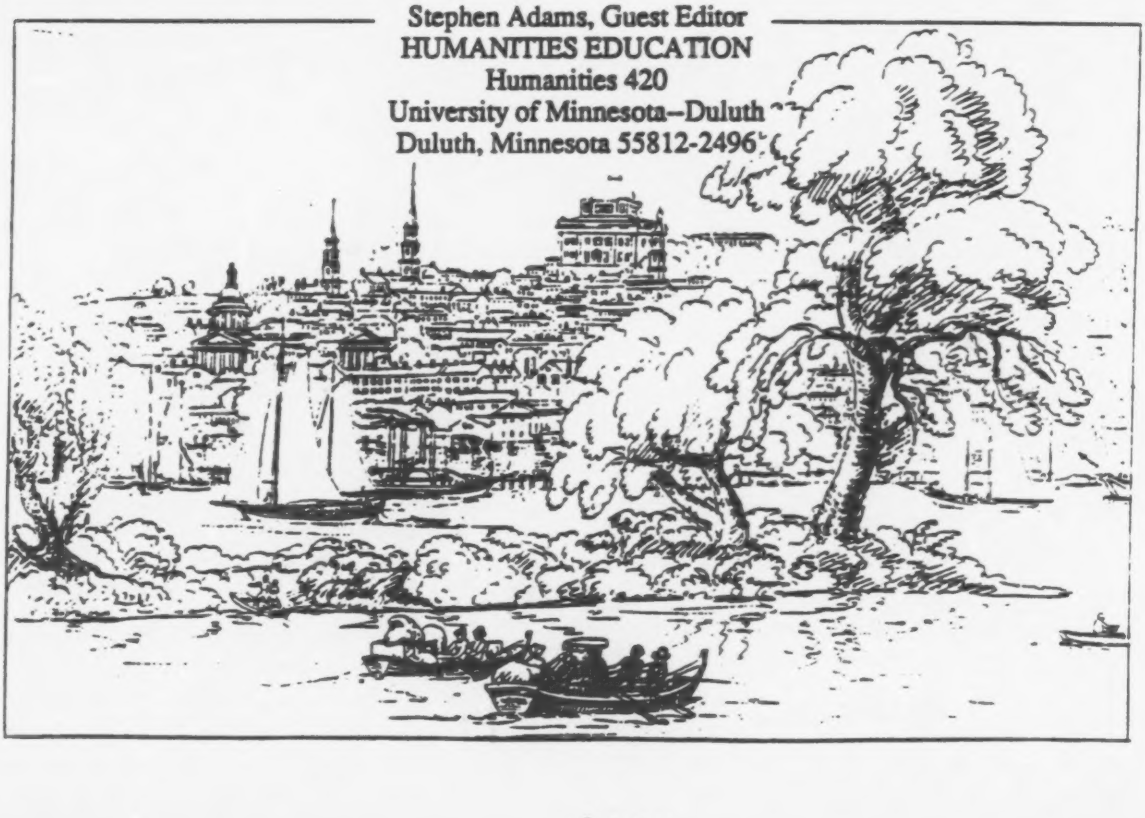
LANDSCAPE, ENVIRONMENTS, AND LEARNING IN THE HUMANITIES

The Spring 1990 issue of **HUMANITIES EDUCATION** will be devoted to the broad areas of landscape and environments, including cityscapes. Topics might include the study of specific places as an index of culture, interactions between setting or background and the main focus in works of art and literature, providing students with a vocabulary and methodology for analyzing environments--among many other possibilities. This issue will also feature slides from the collections of the Minneapolis Institute of Arts with informational notes and ideas for teaching.

As always, articles should relate to interdisciplinary humanities learning from elementary to adult humanities programs. In addition to longer articles (see Editorial Policies), we like to have relevant reviews, abstracts of journal articles, and short pieces describing classroom activities, museum exhibits, favorite documents and artifacts, etc. Selection of articles will be influenced by the need for balance among our many constituencies as well as the usual criteria for accepting submissions to **HUMANITIES EDUCATION.**

The deadline for completed submissions is January 1, 1990. Please send proposals, manuscripts or inquiries to:

Stephen Adams, Guest Editor
HUMANITIES EDUCATION
Humanities 420
University of Minnesota--Duluth
Duluth, Minnesota 55812-2496



HUMANITIES EDUCATION

HumaNews

Official Newsletter of the National Association for Humanities Education

---

EDITOR'S NOTE: Member-subscribers are invited to submit personal newsbriefs about their activities, publication, awards. We will be pleased to print announcements of upcoming conferences, calls for papers, fellowship and seminar opportunities relating to humanities and arts interdisciplinary education. Such announcements should be submitted at least three months in advance of events or deadlines to ensure properly timed publicity.

Send all news items, announcements, and brief comments to Darrell Bourque and Vaughan Baker, Editors **HumaNews**, Drawer 44691, University of Southwestern Louisiana, Lafayette, LA 70504-4691.

NAHE MEMBERSHIP

Why not share membership information with your colleagues in your college or university, elementary or secondary school, state humanities council, historical society or museum? Many of them are looking for just such an organization as NAHE. Copy the NAHE application form on the last page and pass it on to them.

Prepaid individual membership and institutional subscriptions are $16/year. (If you require invoicing or special billing, the rate is $20.) Your payment will be acknowledged, notifying you when to expect your first issue of **HUMANITIES EDUCATION**. We are able to maintain the low $16 membership by printing only as many copies as there are paid memberships, so it is important to join now! Mail this form and your check to:

HUMANITIES EDUCATION
c/o Dept. of Philosophy/Humanities
University of Minnesota, Duluth
Duluth, MN 55812-2496

NEWS ABOUT MEMBERS

We are sorry to announce that Gary D'Lamater has resigned from the NAHE Board of Directors. Gary, who has been our representative from the world of business and humanities, is a long-time member and was a leader in sustaining and rebuilding NAHE in the Eighties. Indiana members will remember Gary as a great organizer in humanities teaching at the secondary level. We trust that as the press of work in corporate staff development is reduced, Gary will be back as an active NAHE member.

INSTITUTES, WORKSHOPS, CONFERENCES, ETC.:

The Association for Integrative Studies will hold its Eleventh Annual Conference October 12-14, 1989 at Sonoma State University, Rohnert Park, California. The theme of the conference is **"Integrative Studies: Achievements and Consequences"**. The conference will include a wide variety of presentations, ranging from a keynote address and formal papers to student-faculty panels and small seminars. For further information write: Professor Lu Mattson or Professor Fred Rider, The Hutchins School of Liberal Studies, Sonoma State University, Rohnert Park, CA 94928. For information about the Association for Integrative Studies contact William H. Newell at (513) 529-2213.

The School for Continuing and Alternative Learning at **George Mason University** will hold its **Seventh Annual Conference on Non-Traditional/Interdisciplinary programs** May 15-17 at Virginia Beach, Virginia. The conference annually brings together scholars, teachers and administrators from across academic fields and institutions to showcase the most current practices in interdisciplinary programs and non-traditional education. It combines both plenary and workshop sessions. The general sessions will focus on the question **"What if the University took teaching seriously?"** which will be posed by Russell Edgerton, President, American Association for Higher Education, in the keynote address. Other distinguished speakers will examine this provocative topic from different perspectives. For further information contact Sally Reithlingshoefer, Associate Dean, School of Continuing and Alternative Learning, George Mason University, 4400 University Drive, Fairfax, VA 22030 or call (703) 323-2399.

Conference on Integrated Interdisciplinary Education, San Diego, June 19-23, sponsored by a number of higher education institutions in California. For college students, faculty and administrators, the conference will take place at San Diego's Doubletree Hotel. Keynote speaker will be Dr. Ernest Boyer, President of the Carnegie Foundation for the Advancement of Teaching, who will address the theme: **"Integrated, Interdisciplinary Education: Rethinking the Curriculum."** Daily themes include: Assumptions about the Progress of Knowledge; Education is never "Value-Free"; Alternative Global Visions Not Currently Taught; and Developing Integrated Programs. The modest (!) goals of the conference include: To identify the central curricular issues of our age, to empower faculty to create new curricula by sharing and exchange of ideas, and to help faculty develop skills in interdisciplinary conversation. Early registration is $200.00. Direct inquiries to Dr. Mary E. Clark, c/o College of Extended Studies, San Diego State University, San Diego, CA 92182.

The South Central Modern Language Association will hold its annual conference October 26-28, 1989 in New Orleans, Louisiana. The conference theme is **Science Fiction and Fantasy**. Papers will be presented on topics related to science fiction and fantasy. One paper has been promised on Magic Realism, for example. The request for papers stated that such topics as "Fantasy Elements in Flann O'Brien's *At Swim-Two-Birds* " would be perfectly acceptable. On the other hand, a discussion of Walt Kelly's Pogo comic strip (or its current revival) as an animal fable would also be acceptable. In short, the spectrum runs from popular culture to symbolic poetry. For further information contact Joe R. Christopher, Department of English, Tarleton State University, Stephenville, TX 76402.

CALLS FOR PAPERS

The Association for General and Liberal Studies has issued a call for proposals for its **Twenty-Ninth International Conference on General and Liberal Studies** to be held October 19-21, 1989 at Butler University in Indianapolis, Indiana. The theme of the conference is **Liberal Education as Cultural Politics**. The conference invites participants to explore the many political, social, and ethical implications of liberal education. AGLS members and guests will consider together the cross relations and influences among liberal education, intellectual development, political development, and self-development. Proposals should emphasize discussion and participation. Preference will be given to proposals that define issues, examine challenges facing liberal education, advance new ideas, or use innovative formats for presenting ideas and involving participants. Proposals (colloquia, workshops, position papers, etc.) should be submitted in a one- or two-page memorandum and should have a detachable cover sheet that bears your name and address. All proposals should be submitted by May 1, 1989 and should be addressed to Marshall Gregory, Department of English, Butler University, Indianapolis, IN 46208. Papers delivered at the conference will be considered for publication in the conference issue of the AGLS journal, *Perspectives*.

Proposals are requested for possible presentation at the annual national conference on liberal arts and the education of artists to be held in November in New York. Contact Mark Salmon, Humanities and Sciences Department, School of Visual Art, 209 East 23rd Street, New York 10010 or call (212) 679-7350.

Abstracts of papers are requested for presentation at a conference on the humanities and technology to be held in October in Marietta, GA. Contact Charles Weeks, Humanities and Social Sciences, Southern College of Technology, 1112 Clay Street, Marietta, GA 30060.

Papers are requested on the theme "**Time, Rhythms and Chaos in the New Dialogue with Nature**" for possible presentation at a symposium to be held in August in Vermillion, South Dakota. Contact Leroy Meyer, (605) 677-5486.

1134

Papers are requested for possible presentation at the joint conference of the **Popular Culture Association of the South** and the **American Culture Association**, to be held in October in Jacksonville, FL. Contact Elizabeth S. Bell, English Department, University of South Carolina, 171 University Parkway, Aiken, SC 29801.

Abstracts of papers are requested for possible presentation at the conference of the **Association of Caribbean Studies**, to be held in July in San Jose, Costa Rica. Contact O. R. Dathorne, University of Kentucky, P.O. Box 22202, Lexington, KY 40522 or call (606) 257-6966.

NEW FILMS, MEDIA, ETC.

The Indiana University Audio-Visual Center has just released a 28-minute program on the philosophies and techniques for teaching and the performing arts. **Performers on Teaching**, produced by the Indiana University Radio and Television Services, examines the views of three acclaimed I.U. artist/teachers on a variety of academic and artistic issues. For further information, contact Barbara Eisinger, Indiana University Audio-Visual Center, Bloomington, IN 47405-5901.

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity**, **humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

Special Focus

Interdisciplinarity in Museums and Exhibits

Editorial note: Last year the National Association for Humanities Education was invited by the Association for Integrative Studies to join in sponsorship of the AIS annual meeting in Arlington, Texas. We responded by inviting three distinguished professionals to discuss aspects of interdisciplinary humanities in public exhibits. The following essays grew out of their presentations. Dr. Michael Jaye of Rutgers University's English Department explains how he developed and presented the critically acclaimed travelling exhibit on William Wordsworth and English Romanticism. Teresa LaMaster of Chicago's great Field Museum of Natural History discusses questions of the place of human values in science exhibits. Tad Park, known to the readers of HUMANITIES EDUCATION for his essays accompanying the slides in our special issues on Rites and Rituals and on Expressions of the Self, describes an interdisciplinary humanities course for secondary school teachers that he taught at the Minneapolis Institute of Arts.

Michael C. Jaye

Text and Image: Contexts for a Cultural Exhibition

William Wordsworth and the Age of English Romanticism

"Through the parallel unfolding of images and ideas, the confluence of the visual and verbal, the experience of the exhibition was intended to be not unlike Romanticism itself..."

William Wordsworth and the Age of English Romanticism sought to illuminate a cultural epoch of apocalyptic intensity and creativity whose force continues to shape our lives. John Russell in *The New York Times* early pointed out the exhibition's uniqueness for American museums in its placing in contextual relationship different kinds of objects which are usually viewed separately: literary manuscripts and books in libraries, watercolors and paintings in art museums, and historical documents in history museums and archives.[1]

The three hundred objects in the exhibition, from over seventy lenders in England, France, and the U.S., forged a crucial testing ground for a multidisciplinary approach to cultural studies. Our purpose was a thematic exploration of those impulses which were manifestly part of the spirit of the age, an exploration that had continually to avoid the intrinsic dangers of multidisciplinary study--the Scylla of facile generalization and the Charybdis of overwhelming historical and biographical minutiae.

The achievement of William Wordsworth (1770-1850), the seminal poet of the age, served as a prism through which to view the revolutionary transformations of the age. His poetry embodied the new impulses of freedom and energy to explore new realms of experience and to create powerful new modes of expression unleashed by the epochal revolutions in politics, society, and industry. Most of his contemporaries in literature and art shared these revolutionary impulses, and the sheer magnificence of the masterworks of the Romantic movement in England richly lent itself to the exhibition's contextual exploration.

The titles of the exhibition's six interlinking sections suggest its scope and thematic concerns: "The Age of Revolutions," "The Spirit of the Age," "The Child is Father of the Man," "The Discovery of Nature," "Unity Entire," and "Memory, Imagination and the Sublime." Although each section comprised a major theme or movement, the exhibition entire was conceived as a progression through recurrence, indeed almost an orchestration, of interconnecting themes juxtaposing different kinds of objects in order to work experientially on many levels--visual and aural, intellectual and emotional, historical and aesthetic. Through the parallel unfolding of images and ideas, the confluence of the visual and verbal, the experience of the exhibition was intended to be not unlike Romanticism itself--knowledge as direct encounter, the energy and enchantment of exploration and discovery, intensity and variety, delight in revelation, and what Wordsworth called the "deep power of joy."

The design of the exhibition was crucial to the success of its contextual conception. Each section was divided into subsections, each section and subsection had an introductory text silk-screened on a panel, and each had a central image, a watercolor or small oil painting that exemplified the theme. Introductory and explanatory texts signposting each section and subsection were intended as guides to exploration, providing essential information and ideas that linked the variety of objects--an external ordering descriptive of an organicism which emerged through the interplay of objects. The texts were written for a general audience, in what Wordsworth called "the language of real men." They tried, in sharing information and ideas, to avoid inflicting the academically fashionable critical arcane "jargot" or the pedant's dogma. [2]

The first section, "The Age of Revolutions," served as both prologue and introduction. Political revolution, American and especially French, with its assertion of human freedom and an ideal society, established the context for the revolution in aesthetics and human values presented in the remaining five sections of the exhibition. The Age of English Romanticism was thus seen in context, as one revolution among many in an age of revolutions. Since Wordsworth was the one major English poet to witness first hand the French Revolution and to take forward and transmute its democratic idealism into poetic vision, the illustrated chronological text of revolution in France and the revolutionary debate in England was punctuated, informed, and given specific relevance by the subtext of Wordsworth's own revolutionary experience. Implicitly, though not always explicitly, we sought a linkage through exhibits and commentary that would make the subtle interconnections between the political ideals of human freedom and the mainsprings of Romanticism which, through many twistings and turnings, were to emerge in subsequent sections of the exhibition--in the beginnings of modern consciousness, in a visionary art that sought to create as well as mirror the world, and in a belief in the power of the transforming imagination that was as profound in its effect upon human life as the concomitant revolutions in the political, social and industrial realm.

Bringing the visual and literal into contextual relationship enjoined a delicacy that would preserve the essential nature of each object and yet create an interaction--at times, almost a dramatic dialogue--among them. Throughout the exhibition, manuscripts and books had to work with visual objects--for the most part, watercolors and paintings hung above or adjacent to works in the cases, although in a few instances books and manuscripts were wall-hung as well, sometimes as integral parts of a commentary. But crucial and culminating moments demanded special efforts in presentation. Thus, at the climax of the exhibition whose subject was the creative imagination, the great works of the major poets in their original manuscripts--Coleridge's "Kubla Khan" or Shelley's "Ode to the West Wind," for example--had to have a discernible presence that was equal to the great canvasses of Turner and Constable. Manuscripts were placed at the center of a panorama--each in its specially designed vertical vitrine, higher and more distinctive than the other cases encountered in the exhibition, aspiring almost by their physical presentation to the status of icons. [3]

Some of the more usual ways in which contextualization and design worked in the exhibition may be seen from some examples in the first section on revolution. Key moments in the French Revolution were highlighted through extensive use of prints, watercolors, and paintings of events that seemed to open up the prospect of unlimited possibilities for human society, famously expressed in Wordsworth's line, "Bliss was it in that dawn to be alive." The representativeness of Wordsworth's optimistic response was underscored by Tom Paine's pronouncement at the close of his *Rights of Man* (1791), "It is an age of Revolutions, in which every thing may be looked for." Citation and image also offered opportunities for dramatic juxtaposition: between the American "Declaration of Independence" and the French "Rights of Man"--or between an amateur but lively watercolor of the storming of the Bastille "drawn on the spot," the introductory image for the section, and a later, more traditional and, indeed, more static and polished composition of the arrest of the Governor of the Bastille, which illustrated how the fluidity of the original historical event was soon frozen into an iconographical and fictive absolute. Images and events tied to some central figures of the age--Lafayette, Madame Roland, Robespierre, and finally Napoleon--created an alternate, more traditional figure-oriented historical perspective. But even here, display was tied to thematic argument. Baron Gros' magnificent portrait of Napoleon at the Bridge of Arcole (from Versailles) creates one archetype of the Romantic hero; its brilliant coloring and large size assured that it would be placed to punctuate the end of the progress of revolution, physically and conceptually. Yet, paradoxically, it also served as a strong force out of which the audience would eddy into another subtext that deconstructed the myth. Less sensationally, off to one side but in the inevitable progress of the audience, was a subsection of Touissant L'Ouverture, the black leader of the Haitian slave rebellion--imprisoned by Napoleon, but the hero of Wordsworth's sonnet (reproduced on a wall panel)--whose indomitable will expressed a true revolutionary power, "man's unconquerable mind." The use of an engraving for the image of Touissant underscored the fact that Wordsworth's real revolutionary hero had no propagandist such as Baron Gros to paint him in heroic posturing.

The second section of the exhibition, "The Spirit of the Age," introduced the cast of characters, often emphasizing their interconnections: Burns, Blake, Coleridge, Shelley, Byron, Keats, Constable, Turner as well as Wordsworth and his sister Dorothy. As a second introduction to the exhibition, this section was as much traditionally biographical as it was thematic, presenting portraits above displays of rare exemplar manuscripts and books.

Although historical and biographical narrative were necessary elements, the exhibition sought to create an experience beyond these, an experience parallel to that of Romantic literature and art, that is, the experience of plenitude, expressed by Wordsworth in his famous metaphor of poetic creation as a spontaneous overflow of powerful emotions, or in the more evocative lines from "The Solitary Reaper," "the vale profound is overflowing with the sound." The ideal was not just plenitude as multitude, but plenitude in the sense of residual and immeasurable depth that Wordsworth often speaks of as the hidden and fecund reality of human experience. The objects selected and the points they made, in number, rarity, and fineness of art, had to affect the audience in many different ways, but especially in the way that being overwhelmed and stunned by exuberant beauty and by thought opens us up to experience.

The third section, on childhood, "The Child is Father of the Man," illustrated Wordsworth's and the Romantic's exploration of childhood experience as central to human development. One hundred years before Freud and Piaget, this was a revolu-

1144

tionary departure in human understanding, and it was the base upon which Wordsworth's view of man, nature, society, and the development of imaginative power stood. The section opened with Wordsworth's short lyric, "The Rainbow," in large type, which succinctly expresses his belief in the sacramental and unconscious force that links childhood experience, nature, and adult life. For the audience, it had the added virtue of the familiar line, "The child is father of the man." But the rainbow as poetic symbol for organic wholeness was made real by Constable's and Turner's brilliant watercolors of rainbows arrayed on the wall. And the links between poet and artist, between illumined metaphor and literary symbol, were displayed in a case below by a copy of Wordsworth's poem in Constable's hand beside the artist's scientific diagramming of rainbows after Newton. These offered a further opportunity to present, without attempting to resolve, the antithesis represented by Romantic attitudes toward Newton and science, the conflict between reason and emotion, empiricism and intuition--a duality caught in both image and text through Blake's magnificent watercolor of Newton with his compasses and in Haydon's letter to Wordsworth recalling Keats' toast to the damnation of the memory of Newton because Newton "destroyed the poetry of the rainbow." It was such variousness, the clarity of contradictions and oppositions as well as the melding of literature into art, the transference of verbal to visual to thought and feeling, the to and fro of mind and eye, in which the exhibition seemed most to fulfill its objectives of having the audience engaged in process. In such interactions the exhibition brought the singular objects into another, a more tacit dimension.

It was primarily within this tacit dimension, this mode of interactive and manifold experience, that the last three sections of the exhibition unfolded. The fourth section, "The Discovery of Nature," emerged as the center of the exhibition into which everything previous had led, and which everything after would sustain and develop. A subsection on the "picturesque" established the aesthetic context for Wordsworth's new vision of man and nature; then the display of Wordsworth's "Tintern Abbey" in manuscript and book, watercolors of the ruined abbey, and extensive excerpted texts of the poem formed the real starting point for this section. Not only did Wordsworth's revolutionary poem in *Lyrical Ballads* 1798 alter the course of English poetry by expressing a new relationship between man and nature, but importantly, for Wordsworth and his contemporaries the catalyst for this new perception was the intervention of interior consciousness so that the discovery of nature was necessarily also the discovery of self.

During the same period that the poet was forging a new mode of expression for a powerfully new vision of man and nature, a comparable liberating and experimental impulse fueled the phenomenal rise of English watercolor landscape art. Wordsworth's famous line from "Tintern Abbey," "we see into the life of things," speaks to a desire within both poet and artist. Both were impelled to create a fresh, intimate, lyrical mode of expression to convey their visionary insight into both world and self. John Sell Cotman's watercolor, *Hell Cauldron,* with its blocks of marled color patterning the multifaceted nature of a Yorkshire landscape, was the exemplary image for this text, given a central position alongside an explanatory panel. It was at this point that text yielded to a dominance of image, with the exhibition space opening up and onto a display of some of the finest examples of English Romantic watercolor landscape art. Against the orthodoxies of historical oil painting established by the Academy, the watercolors of Thomas Girtin and John Sell Cotman as well as J.M.W. Turner reveal a countering original impulse toward an intimate, almost sanctified personal vision of nature, a "natural" art whose subject was alone the perception of nature, while an occasional display case with manuscripts and books emphasized the shared and highly vaunted Romantic credo of spontaneity, originality, and authenticity. Here the confluence of poet and artist came truly alive, in creating an intimate apprehension of the relationship between self and nature, seeking beyond the surface of deeper motions, evidenced in the exhibition of such famous poems as Wordsworth's "Daffodils" and the marvelous dramas of fluidity and change in Constable's sky studies, or the energy of Turner's seascapes and his almost impressionistic "colour beginnings," landscapes which seemed to distill and bring to the surface the hidden motions of the world.

The last two sections of the exhibition extended this contextualization of literary text and painterly image. The fifth section, "Unity Entire," subtitled "On Man, On Nature, and On Human Life," taken from Wordsworth, expressed an ideal of a rural social world bonded by a life which is in daily contact with nature. It is an ideal evident in a number of Wordsworth's own poems such as "Michael" and in the choice of the subject of rural life by artists such as Peter De Wint and John Sell Cotman. But Wordsworth's sense of the deep rootedness of human life in a landscape is especially shared by John Constable, and the display of three of Constable's masterworks, *Dedham Vale*, *The Glebe Farm*, and *Parham Mill*, equally proclaimed that essential reality was vested in the simple and the commonplace. "Men who do not wear fine cloaths" [*sic*], Wordsworth said, "can feel deeply." The section concluded by merging the biographical with the thematic in a panorama of Wordsworth's native English lake district with the works of artists who shared his ideal of a rural paradise.

The interaction of text and image culminated in the final section, "Memory, Imagination, and the Sublime," which dealt with the sense of loss and mutability that led Romantic poets and artists to a powerful expression of the need to overcome loss through the agency of imaginative intervention. Here the balance between text and image shifted to the visual, with larger oil paintings and watercolors in greater concentration than were generally to be found earlier in the exhibition. Here, as elsewhere in the exhibition, there were quiet moments, backwaters of design and argument, where one could encounter little gems such as Constable's small oil painting of *Weymouth Bay* which he himself associated with the death by drowning of Wordsworth's brother. One subsection dealt exclusively with the English Romantics' sense of the sublime as an experience of power arising out of their perception of the Alps. Shelley's great phenomenological poem, "Mont Blanc," and Wordsworth's manuscript lines on crossing the Simplon Pass were matched by such visual counterparts as Francis Towne's *Source of the Arveiron* with its magisterial glacial force. But it was Turner who best evoked the sublimity of the awesome alpine landscape, and six of his watercolors revealed a progression from early representation to late impressionistic vortices which seemed to fuse the power of the creative mind with that of the natural world. The visual display made manifest Wordsworth's and the Romantic belief that true sublimity was a function of the creative imagination, a power within equal to that without.

The conclusion of the exhibition was designed as a *conclusion*, the culmination of the exhibition's narrative and experience in a celebratory display of works that validated the Romantic belief in the triumph of the creative imagination--a revolution in human perception and creative freedom equal in power and influence to that of the political and industrial revolutions that were its counterparts. In this final bay, the surrounding walls were hung with large oil paintings--John Crome's *Moonlight on the Yare*, Constable's large oil

1146

sketch, *The Lock*, and two of Turner's late masterpieces, *The Valley of Aosta* and *Loch Fyne*. But the section and its argument were introduced in a smaller, but no less powerful, watercolor by Thomas Girtin, *White House at Chelsea*, that fully realized the Romantic belief in the power of intimacy as a mode of knowing, and whose depiction of the last rays of the setting sun illuminating and so transforming an ordinary house on the river's edge was itself a metaphor for the action of the creative imagination that reveals the extraordinary within the ordinary. This latency of the extraordinary within the ordinary that the Romantics saw as the incomparable and sometimes holy power of the imagination to release and reveal was made manifest in the manuscripts that formed the center of this last section. Gathered together in their high cases were the exemplar texts of the Romantic imagination--Wordsworth's *Prelude*, Coleridge's "Kubla Khan," Blake's *Four Zoas*, Shelley's "Ode to the West Wind," Keats' "Ode to Autumn," and Byron's *Childe Harold*--all works which are explicitly or implicitly about the transforming imagination.

Appropriately, as the audience left the exhibition they encountered Benjamin Robert Haydon's portrait of Wordsworth, and above in large text were the closing lines of Wordsworth's great autobiographical poem, *The Prelude*--lines which describe his ultimate purpose in being a poet of the revolution of "the mind of man." That purpose was to "instruct" us

> how the mind of man becomes
> A thousand times more beautiful than the
> earth
> On which he dwells...

Michael C. Jaye
Department of English
Rutgers University in Newark

---

[1] *The New York Times*, Oct. 25, 1987. Other critically favorable reviews appeared in many other national and international publications, including Robert Hughes' full page review in *Time* magazine which said, "The unity of English romanticism has never been argued so well, or shown so plainly in a single exhibition. This is not a show to miss." The exhibition was organized by Rutgers University and the Wordsworth Trust. It was on show at The New York Public Library, Indiana University Art Museum, and the Chicago Historical Society for twenty-three weeks between Oct. 29, 1987 and June 5, 1988, and was seen by almost 200,000 people. Other elements of the project included a full-color 24 panel poster exhibit, of which some 500 sets were disseminated world wide, and hundreds of public and educational programs, exhibitions, readings, seminars, conferences, and performances, which took place throughout the United States on the theme of Romanticism, often in conjunction with the museum or poster panel exhibit.

[2] Graphics were conceived on three levels: large type for large introductory statements for each section and a poetic headline, medium type for subsections, and small type for labels. In addition, poetic texts on panels were silk-screened in a dark green so that poetry was omnipresent in book, manuscript, panel, and transcription. Instead of a traditional audio tour, our acoustiguide had selections of poetry read by a modern English poet, Tony Harrison, whose strong northern English voice shared some of Wordsworth's known characteristics. Our purpose was to bring poetry alive within the exhibition, and one could see the clear expressions of pleasure on the faces of visitors as they listened to the poetry while following the text on a panel.

[3] Presenting manuscripts in a way that would invite discovery and create delight was a challenge, especially since they might have seemed to pale when placed into relationship with the magnificent colors and forms of great masterpieces of English Romantic art--Constable's "Stonehenge" or Turner's "Valley of Aosta," for example. But, in fact, they held their own. Manuscripts, especially those of famous poems that called forth personal memory, proved to be as exciting as paintings, as witnessed in both the recorded comments of visitors and the critical reviews. I was once told by a curator from a fine arts museum who had lent, somewhat skeptically, a picture to the exhibition, that he never knew that manuscripts could be so exciting or so beautiful! Perhaps no less of a discovery was that works of great art, rather than being diminished, could be enhanced by the evocation of contextual meanings without impinging their aesthetic value.

"Man's search for Identity": A Humanities Survey for Teachers at The Minneapolis Institute of Arts

"...the artist is seen as an explorer and discoverer in the realm of the human personality"

The Minneapolis Institute of Arts is a medium-sized, encyclopedic institution whose collection houses over 80,000 objects. One of the ten finest city museums in the United States, it includes all time periods and nearly every geographic area of the world. Visitors to the museum are constantly impressed by the great variety of world cultures found there. Asia, Africa, North and South America, Europe and Oceania are all represented with an unusually well-chosen survey of artworks which reflect major trends in the complex cultural fabric of world history.

A walk through the galleries of the Institute is an adventure that can take the visitor from the 20,000-year-old sacred cave shrines of Europe through ancient Egypt, Greece and Rome. One can see imperial treasures from China and Japan and celebrate great moments in the saga of the Buddha. Time spent in the museum's European galleries brings one in touch with the major themes of the Western perspective, its history, religion and social values, which are related to so much of American culture. An alternative viewpoint is seen in the masterworks of African artists or the quilted history of Hmong refugees. In sum, the museum is a storehouse of humanities-related material, emphasized in the philosophy of its education department: "Art reflects the culture."

With such a collection at hand and with resource people who are sympathetic to cross-cultural thinking available to offer ready access, one might expect the museum to be filled with interdisciplinary study groups, especially at the high school level, before "hardening of the categories" sets in. Unfortunately, not so. Only a handful of teachers in Minnesota public high schools teach humanities courses. Although the exact number of such teachers and their courses is difficult to pinpoint, Gilbert Valdez, Manager of Instructional Design for the Minnesota Department of Education, cautiously estimates that only 35 or 40 humanities courses are offered in the state. The general criterion Valdez uses in his estimate stipulates that a humanities course approach several subjects in an interdisciplinary fashion and allow the student to synthesize information from various fields into a unified perspective.

This definition in itself can be a stumbling block to many an embryonic humanities program. Combining such subjects as history, classics, philosophy, art, music, literature and comparative religion challenges the teacher as well as the student to master several disciplines. He or she must have a vital interest in teaching all the subjects, a difficult task. Nor does Valdez see team-taught courses as an easier answer, unless the teachers work to integrate their materials. The tendency otherwise can be for teachers merely to teach their regular curriculum under a different heading, leaving students with the same fragmentation they would experience without the connecting structures of a humanities course.

Even for the teacher committed to an emphasis on making the relationships between areas of learning, there are many problems in teaching and studying the humanities, particularly in the survey courses that are the basis of most high school offerings. First, there is the sheer wealth of available information. So much must be covered in so little time; so many people and ideas must be presented. How does one choose from the vast richness of past cultures? Second, there is the organization of this information. How can one bring all these creative minds, currents, and movements into a helpful but unforced order? Third--and perhaps most important of all--is the problem of effective presentation. How can the teacher enliven this material in a way that sustains the interest of the student?

For three years running The Minneapolis Institute of Arts has offered a course entitled *Man's Search for Identity: Humanities and the Arts* that attempts to place these questions in perspective. It has been the museum's experience that the majority of teachers seeking such direction are those with single-subject expertise, usually English or Social Studies, who wish to expand their course offering but feel ill at ease designing an interdisciplinary curriculum for the reasons given above. At the museum, the teachers participate in a three-hour workshop in the galleries that combines art, music and literature in both thematic and chronological groupings. It is not our intention to promote any particular curriculum; rather, we are modeling a framework from which to approach the teaching of humanities.

The course operates on the premise that we study the humanities to find out who we are and why we are what we are. In this study both accurate knowledge of the self and of the right relation between self and culture are the desired goal. It is further emphasized that this search for identity underlies most of the artistic expression. Whether revealing of cultural or personal values, art speaks fundamental truths about the human condition. To quote the American composer Ned Rorem, "Artists are like everyone else, only more so." In this course, then, the artist is seen as an explorer and discoverer in the realm of the human personality. The work of art itself is treated both as a unique creation and a cultural document.

This approach is introduced through a discussion of three artistic presentations of personality: Shakespeare's Hamlet, in his Act III soliloquies; Puccini's Tosca, in the aria "Vissi d'arte"; and Egon Schiele's portrait of the artist and poet Paris von Gutersloh. These three selections were made because each is a fairly direct summation of the essence of the character; each character is in conflict, whether with self, with culture, or with forces at work outside the self; and each asks a question about the meaning of life. Participants are asked to study each work from three perspectives: 1) what does the work reveal of the character's identity--how is he/she portrayed by author, composer, artist; 2) what role do the formal elements play in this characterization--how do line, color, texture, metre, tone contribute to our experience; 3) what does the work reveal about the time and place in which it was created--how does it fit in the context of Renaissance England, the Belle Epoque, World War I Vienna? The discussion which follows vividly illustrates how artists at different times and places have sought through different media to express the universal theme of the search for identity.

Following this initial introduction, five "units" or thematic sub-groupings are studied in the galleries of the museum. Each addresses an aspect of the search for identity by looking at a period of history, a particular culture, or an artistic movement. Each combines works of art, taped music, and selections of literature in time-honored groupings and examines and compares the contributions of each work, each discipline, separately and cumulatively in relation to the theme. Unit I begins with Classical Greece and Protagoras' dictum that, "Man is the measure of all things", as it expresses the Greeks' search for a cultural identity. The works used include various examples of 5th century B.C. sculpture and vase painting; *The Bacchae* of Euripides and Pericles' funeral oration from Thucydides' *History of the Peloponnesian War*; and the few conjectural fragments we possess of what music may have sounded like at that time.

Unit II explores the Renaissance attitude summed up in Alberti's statement that, "Men can do anything with themselves if they will." Here the emphasis is on the search for individual identity and the period's pride in human accomplishment. The works discussed include: Vasari's *Six Tuscan Poets* and Da Costa's *Portrait of a Cardinal as Saint Jerome*; selections from the writings of Pico della Mirandola, Machiavelli, Alberti, Vasari and Della Casa; and the motets and madrigals of des Pres, Dufay, Palestrina and Monteverdi.

Unit III examines how a specific example of the individual in conflict with society and with self has been interpreted at a variety of times and in a variety of media. The classical story of the "Rape of Lucretia" is studied in the writings of Livy, Shakespeare and F. Scott Fitzgerald; in Rembrandt's painting; and in Benjamin Britten's opera. With this shift from the historical framework to a more ideological one, Unit IV investigates the Romantic crisis of identity as presented in Goya's *The Horrors of War*, Mill's *On Liberty* and Byron's *Prometheus* as well as his *Epistle to Augusta*; and Berlioz' Harold in Italy. Unit V concludes with a look at the individual's response to death, mortality and the end of things as embodied in a group of works produced around World War I: Kandinsky's *Study for Improvisation V, Mahler's Das Lied von der Erde*, and Eliot's *The Hollow Men.*

Of course, these units offer only the briefest of introductions, barely thirty minutes apiece, to the themes they address. Nor are the formal underpinnings of the individual disciplines given the sort of background they would necessarily receive in the classroom. But the purpose of the workshop is not to make instant experts of the participants. It is, rather, first to make them more comfortable with the museum and its resources and second to suggest one of many methods for creating a unified humanities curriculum. In this we seem to have succeeded. Each year the course has been offered it has filled to capacity, and whether the participants returned to the classroom inspired to institute a new Humanities I or merely were empowered to teach English, Social Studies or Art History more creatively it has fulfilled its purpose.

PARTIAL BIBLIOGRAPHY OF HUMANITIES SOURCES FOR HIGH SCHOOL

While there are many good texts about the content and teaching of the humanities, as well as excellent classroom guides, here are a few of the Institute of Arts' recommendations.

Fleming, William. *Arts and Ideas*. New York, 1986.

Greer, Thomas H. *A Brief History of Western Man*. New York, 1987.

___________, ed. *Classics of Western Thought*. New York, 1980.

Janaro, Richard P. and Altschuler, Thelma C. *The Humanities as a Technique for Living*. New York, 1984.

Lamm, Robert, Cross, Neal M. and Turk, Rudy H. *The Search for Personal Freedom*. Dubuque, 1985.

Lockspeiser, Edward. *Music and Painting: A Study in Comparative Ideas from Turner to Schoenberg*. New York, 1973.

Martin, F. David and Jacobus, Lee A. *The Humanities Through the Arts*. New York, 1983.

Munro, Thomas. *The Arts--Their Interrrelations*. Cleveland, 1967.

Rogers, Robert A. *The Humanities: A Selective Guide to Information Sources*. Mittleton, Colorado, 1974.

Ronning, Ronald H. and Reedy, Jeremiah, eds. *Articulating the Ineffable: Approaches to the Teaching of Humanities*. Lanham, MD, 1983.

Vyverberg, Henry. *The Living Tradition: Art, Music and Ideas in the Western World*. New York, 1978.

Wold, Milo, et al. *An Introduction to Music and Art in the Western World*. Dubuque, 1987.

A caveat: While all more than merely useful books, none of the above touches on non-Western cultures in any substantive way.

Teresa K. LaMaster

Adam and Romeo: The Many Meanings of Natural Things

"...exhibits...are artifacts of the culture of their makers"

Our understanding of how objects in the natural world are meaningful to us shuttles between the ends of a continuum. At one end is "The Adam Experience", best captured in the myth of Genesis.

> So out of the ground the Lord God formed every beast of the field and every bird of the air, and brought them to the man to see what he would call them; and whatever the man called every living creature, that was its name. [Genesis 2:19]

Here ordering, classifying and naming the miraculous chaos of nature is fundamental to our experience of the world, and our ability to understand our own place in it. The botanist, zoologist, and geologist are makers of meaning through rational taxonomic adventures in the garden Earth. At the continuum's other end is "The Romeo Experience", best captured in lines from Shakespeare's romantic tragedy.

> What's in a name? That which we call a rose by any other word would smell as sweet; [*Romeo and Juliet*, II.ii]

Romeo's concern, of course, is Capulets and Montagues, not roses. Yet, Shakespeare's lines also picture a popular attitude toward nature. In this view, the human constructs of naming and classification matter little to the identity of natural things or our experience of them. Rather, the meaning of the natural world is immediate, sensual, perhaps aesthetic, and certainly beyond language. The mystic, aesthete, and lover of the sublime are makers of meaning through rapturous, sensual encounters with nature that reach beyond language.

I have heard museums variously described as attics of the exotic, cultural loot heaps, temples to artistic achievement, warehouses of the incredibly real. Their distinctiveness as institutions is marked by their having *things* and by their orchestrating encounters between *things* and diverse publics--between *things* and "Adams" and "Romeos" alike. Natural history museums collect and present both the odd and the ordinary in nature. They create contexts for these objects--exhibits--to help lead visitors to meaningful encounters with them.

Traditionally, natural history museums have created exhibits on a conceptual framework more akin to the "rational, taxonomic adventure" than to the "rapturous, sensual encounter." One only need think back to one's youth and a trip to a natural history museum with long hallways filled with case after case of birds, or plants, or butterflies for an example. Such exhibits contain a host of assumptions about visitors, who they are, how they learn, what they find interesting. They also contain, however, assumptions about natural history as a discipline and about the view of the relationship between objects and meaning embedded in that discipline. That is to say, exhibits represent not only the objects in them, but a picture of the discipline of the institution that does the collecting. As such, exhibits themselves are artifacts of the culture of their makers.

A peculiar picture of natural history is presented in these exhibits. The picture is that natural history is a science, the simple sum of botany, zoology, and geology. In this view, objects are thought to contain facts; master the facts and you know the meaning of an object. A museum visit is a "fact-finding" mission, an attempt to take in and understand the tidbits of information contained about objects in exhibit label copy. While the manifold scientific disciplines of the twentieth century have brought with them an explosion of data and facts about natural objects, over-reliance on the mastery of facts as a model of learning for the museum visitor misunderstands the tradition of natural history and the educational possibilities latent in the museum. I would like to focus briefly on the tradition of natural history in an effort to tease out what some of those possibilities might be.

Natural history began to flourish around the sixteenth century through the first concerted, systematic work of naturalists. In this era, nature was conceived of as a grand metaphor for human life, and all objects taught practical, aesthetic, moral or spiritual lessons. Though early naturalists had inherited from Aristotle the practice of classifying animals according to their anatomical structure, habitat and mode of reproduction, they more often grouped animals according to their value to human beings, and labeled them according to human-like personality traits. Systems of classification included ordering plants and animals by how good they were to eat, their medicinal value, whether or not they were beautiful or which human-like virtues and vices they displayed. As the French philosopher and historian Foucault describes,

> The history of a plant or animal was as much a matter of describing its elements or organs as of describing the resemblances that could be found in it, the virtues that it was thought to possess, the legends and stories with which it had been involved, its place in heraldry, the medicaments that were concocted from its substance, the food it provided, what the ancients recorded of it, and what travelers might have said of it. [Foucault, 1970; p. 129]

One might say that the experiences of Adam and Romeo were of a piece. Though strict scientific observation played a role in ordering and classifying nature, stereotypes from the literary tradition and a host of human meanings associated with any natural thing figured strongly.

The ensuing centuries were guided by an impulse toward objective, rationalistic principles of classification, based on strict observation of the natural world and a belief that meaning inhered not in human associations with an object, but in the thing itself. John Ray and Francis Willoughby were first among the English to attempt to free natural history from its reliance on human associations and analogies. Ray wrote in 1678,

> We have wholly omitted what we find in other authors concerning hieroglyphics, emblems, morals, fables, presages, or aught else appertaining to divinity, ethics, grammar or any sort of human learning; and present...only what properly relates to natural history. [Thomas, 1983; p 67]

Though Ray's program was easier to imagine than to practice, organization, classification, and the meaning of natural objects came to be based on the structure and function of organs. This turn toward objective principles of classification, coupled with technological advances like the invention of the microscope, worked to create a strong split between what we have come to call popular and scientific understandings of nature. Today, we have seen this split widen into a gaping chasm. Myriads of specialized sciences play their parts in making sense of the natural world. Genetic studies, biochemical investigations, behavioral observation, and many other kinds of research all contribute to the task of giving meaning to the natural world. The prevailing tendency is to call this specialization of expertise and the onslaught of information that has accompanied it, progress. Allegedly we have cleaned up our understanding of nature by eliminating human stories and associations. Foucault questions the value of this explosion of information by suggesting that science so conceived,

> did not become possible because men looked harder or more closely. One might say, strictly speaking, that [the Enlightenment] used its ingenuity, *if not to see as little as possible, at least to restrict deliberately the area of its experience.* [Foucault, 1970; p 132; emphasis mine]

The naturalists' reliance on observation came to the exclusion of other sensual experiences of nature including taste, smell, touch and hearing. Moreover, a thing's "biography" as expressed through the literary tradition and oral tradition, or its human uses was ignored. He puts it aptly to say, "the blind man in the 18th century can perfectly well be a geometrician, but he cannot be a naturalist." [Foucault, 1979; p 133]

What relevance do these tandem claims--that museum exhibits picture disciplines, and that the picture they give of natural history is a scientistic one--have for scholars and educators like yourselves interested in integrative studies in the humanities? What implications do they have for those who visit museums? Surely one would say it is the museum's responsibility and challenge to sort out its disciplinary focus and develop exhibits to spark both a Romeo and Eden experience.

Surely I would agree. And many museums are beginning to address these issues, largely through interdisciplinary exhibits. One particularly fine example was an exhibit on wolves developed several years ago by the Science Museum of Minnesota in St. Paul. Here the visitor saw wolves as they were portrayed in myth and legend, as they were studied by scientists, and as they impacted the lives of environmentalists, farmers, and trappers. This juxtaposition of literary, scientific, and political contexts allowed visitors to compare both the "data" of each perspective, and the conceptual frameworks of which this "data" is a part.

Yet, I think too (in an admittedly more muddle-headed way) that exhibits which are not so self-conscious about their assumptions can be fine fodder for reflection on how we picture disciplines and what our pictures say about ourselves and our relationship to the world. My suggestion to you on your next visit to a museum is to explore not only the artifacts in the exhibit, but the *exhibit as artifact*. What are the organizing principles of the exhibit? What assumptions do they reflect? What pictures of ourselves are presented as we display these things, in these relationships? Why *this* story, in *this* time? What is valued? What is ignored?

I close quoting Thomas Thompson from the Minnesota Historical Society from his essay, "The Frame and the Framers":

> As important as the intended meanings of our artifacts and exhibit interpretation techniques are, it is essential that we understand the deeper meanings with which we imbue every object. Exhibits are like great pictures, and we expect visitors to study them, not the surrounding frame. But the frame--and we the framers--are a matter of great interest.

CALL FOR PAPERS:

LANDSCAPE, ENVIRONMENTS, AND LEARNING IN THE HUMANITIES

The Spring 1990 issue of **HUMANITIES EDUCATION** will be devoted to the broad areas of landscape and environments, including cityscapes. Topics might include the study of specific places as an index of culture, interactions between setting or background and the main focus in works of art and literature, providing students with a vocabulary and methodology for analyzing environments--among many other possibilities. This issue will also feature slides from the collections of the Minneapolis Institute of Arts with informational notes and ideas for teaching.

As always, articles should relate to interdisciplinary humanities learning from elementary to adult humanities programs. In addition to longer articles (see Editorial Policies), we like to have relevant reviews, abstracts of journal articles, and short pieces describing classroom activities, museum exhibits, favorite documents and artifacts, etc. Selection of articles will be influenced by the need for balance among our many constituencies as well as the usual criteria for accepting submissions to **HUMANITIES EDUCATION.**

The deadline for completed submissions is January 1, 1990. Please send proposals, manuscripts or inquiries to:

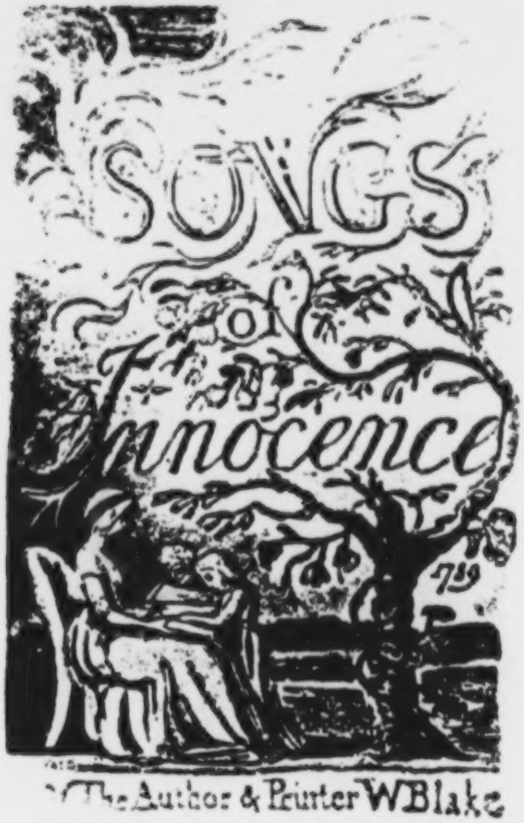
"If Thought is Life and Strength & Breath": Learning Through Eye And Ear From William Blake's *Songs of Innocence and of Experience*

"...knowledge--whether you are a prophet or scientist, a teacher or student--involves trying-out exercises, tests that may or may not lead to truths."

Blake's *Songs of Innocence and of Experience*, I have come to feel, should never be "taught," if by teaching we mean instruction by precept or paradigm. Instead they should be "learned"--learned by "experiment"--that is, by the same exploratory approach to the subject of education that intrigued Blake from the time of his earliest works. Through the use of dramatic narrative in *The Book of Thel*, for example, Blake exposes the sinister methods used by Deistic disciplinarians who disguise themselves as a lily one moment and a maternal clod the next. In the two parts of *There Is No Natural Religion*, he uses the teacherly terms and rhetorical tools of the inheritors of Aristotle to prove them wrong, then reuses the same tools to prove his own "Infinite" truth correct. In *All Religions are One*, he misuses logic in order to lay down dogmatic principles, a strategy that the Devil in *The Marriage of Heaven and Hell* modifies for his purposes a few years later.

In all of these efforts, Blake focuses on the subject of learning while at the same time varying considerably the learning experience. It is as if he is deliberately testing the educational effectiveness of certain modes of presentation--the comic, the satiric, the lyric, the empiric, the didactic, the philosophic being the most clearly identifiable. In doing so, he is quite unlike his own caricature of the "cold and hoar" schoolmaster who guards his knowledge jealously and does not tolerate points of view that differ from his own. Detached from the voices in these early works, Blake, instead, respects the intelligence of his audience, and encourages lively critical debate of the issues he raises. In defiance of the Obtuse Angles of the world who believe "it is of no use for a man to make Queries but to solve them" [*An Island in the Moon* 2], Blake often puzzles his reader by posing unsolvable queries. His aim--to echo the words and chief intent of Jonathan Swift--is to "vex" his audience so that it will "wonderfully mend the World" [Swift letter to Pope of 29 September 1725 and letter to Charles Ford of 14 August 1725].



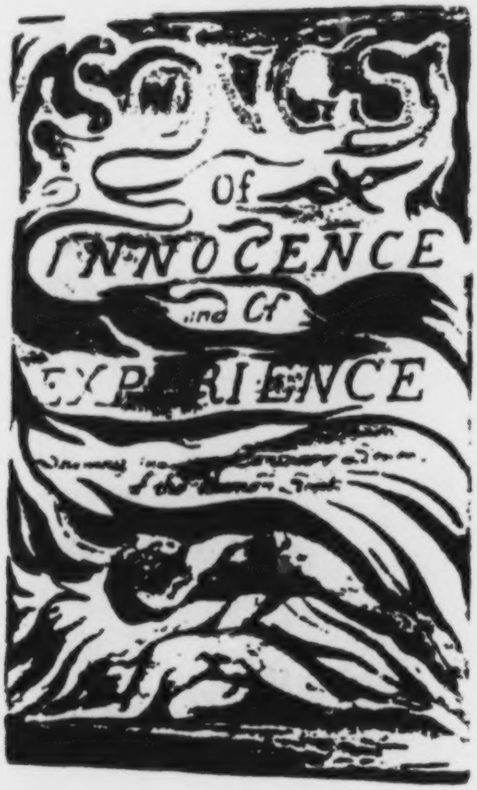
SONGS
of
Innocence
1789
The Author & Printer W Blake

But these early works are only warm-up exercises for *Songs*, an infinitely suggestive volume that generates questions and meanings like a dynamo generating electrical currents. In 1789 Blake assembled *Songs of Innocence*, a generator complete in parts but designed in miniature, which may be the reason why he continued to issue this first volume on its own. The addition of *Songs of Experience* five years later simply enlarged the field of energy to reinforce Blake's conviction that education involves the complete reexamination of our ideas about the value of learning and the methods we use to learn. As if to emphasize that learning is a communal activity--not one directed by pedants who "wish to lead others when they should be led" ["The Voice of the Ancient Bard"]--Blake offers his audience a literary, artistic, and musical study of human relationships to be heard, to be seen, and, above all, to be pondered.

The result is that *Songs* works on its reader-viewer much the same way as drink works on Macbeth's porter: it is a "great provoker" that sets us on and takes us off, persuades and disheartens, feeds desire and mars fulfillment. To keep us honest, Blake plucks our pedagogic chords mercilessly, especially those that help us "compare & judge of what [we have] already perciev'd" [*There Is No Natural Religion* a5]. With one hand he offers us clear definitions and sharp contrasts, with the other he muddies definition and neutralizes opposition. One minute he challenges us to find the structural key to *Songs*, the next he chides our presumption by collapsing all notions of order. He lulls us to sleep with easy rhythms and idyllic images, then shocks our "lapsed" souls with broken meters and jarring diction. He moves us to tears with descriptions of human suffering, then cautions us about behaving like sentimental milksops. He incites us to outrage at institutional injustice, then holds a mirror up to fools filled with passionate intensity. The more engaged we become with *Songs*, the more perceptive our thoughts, the more complex the issues, and the less familiar the world we thought we knew so well.

Given that *Songs* is meant to sting us like Lear's "pestilent gall," how should we make our way through it? "The Argument" of *All Religions are One* offers a starting point: "As the true method of knowledge is experiment the true faculty of knowing must be the faculty which experiences." The clever tie here between "experiment" and "experience" underscores Blake's belief that knowledge--whether you are a prophet or scientist, a teacher or student--involves trying-out exercises, tests that may or may not lead to truths. The process is dynamic and was used by Blake throughout his life, his surviving manuscripts, drawings, prints, and paintings bearing witness to this human impulse. Blake insists that truth changes and that we change because what we know changes. In contrast, to institutionalize knowledge is to incarcerate it--every unexamined truth in a closed, empirical system being a link in the chain that manacles free thought.

In our search for security of understanding in a world of shifting truths, we rely on metaphor for continuity. But in *Songs* Blake forces us to test the limits of all comparison, whether the factors are in-

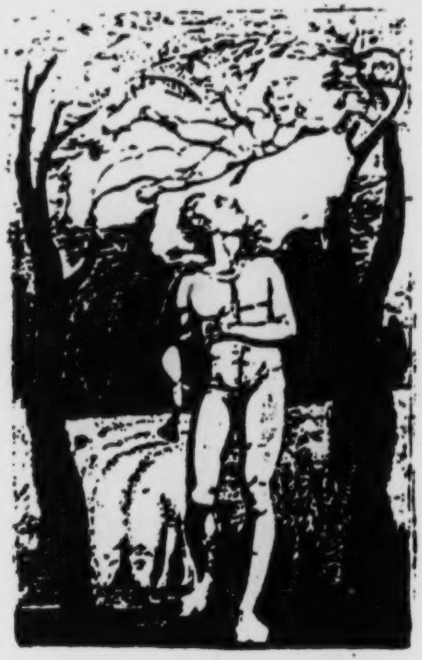


nocence and experience, contrary pairs of poems, images, colors, characters, verse forms, or etched surfaces. This subversive approach is introduced in the first plate of the combined volume: the title page. Here we are cued to think in terms of "Two Contrary States," but any alert observer soon realizes how simplistic that formula is.

While listing contrary images--earth and air, human figures and soaring bird, flesh and fire, horizontal and vertical, "Innocence" and "Experience"-- we become aware of peculiar blendings and begin to be troubled by certain details. Why is "SONGS" given ornate top billing? How can the "Human Soul" be divided in "States"? Are there only two "States" or only two "Contrary States"? Why aren't the scripts for "Innocence" and for "Experience" more obviously opposed?

And the illustration offers little help. Of what iconographic significance is the bird? How is it related to "SONGS" or "Innocence" or fire or sky or the couple below? Why are the two central figures suffering? Does knowing the reason for their distress help us better understand the plate? Why is the woman's face visible in some copies and hidden in others? Are the flames wrathful, purgatorial, both? To what extent is the meaning of the plate self-defining, to what extent allusive? How do we know, in fact, when we are asking the right questions? At this point, the slim text raises questions that may or may not be answered by the design, the design, in turn, raising questions that may lead us closer to understanding the text, or may lead us astray. The design seems at first to offer definite clues as to how we might best grapple with the ambiguities of text, but, after all, it does not fulfill this hope. Moreover, we are not just groping after meaning here; we are being forced to consider how different mediums communicate meaning, and if their messages might be compatible.

Nor does turning the page to Blake's wordless frontispiece ease our frustration. With innocent eye we witness a strange encounter between a naked child floating before a cloud or precariously suspended in the sky, and a young man with a pipe in hands.



The precise circumstances surrounding the event are mysterious, though we may have a vague feeling that an initiation of some sort might be taking place. And other details in the design do not help us much. Does the forest represent idyllic seclusion, or ignorance, error, evil? Are the peaceful, anonymous sheep being well-tended by the crookless shepherd, or has he left his flock to the wolves? Do the foreground trees on left and right symbolize solitude and love, or independence and dependence, or piper and child, or none--or all--of the above? The plate is, after all, baffling because of its focus on an apparently significant but nonetheless cryptic meeting between two human forms, and its use of highly suggestive iconographic detail.

Unlike piper and child in the frontispiece who are moving out of the landscape, the figures on the facing title page are lodged in it. As the central figure of pedagogic attention, a rigid mother-nurse has replaced the ethereal babe of the frontispiece, while two bookish children have replaced the animated piper. Although the design here is quite different from that of the frontispiece, the theme remains learning and the details remain ambiguous rather than definitive. What book are the children learning to read? Does it make any difference, really , or is it more important that, in contrast to frontispiece child and piper, the heads of these youngsters are bowed down in dutiful study, and their bodies covered in heavy gowns after the fashion of their teacher? Does the tree represent the Tree of Knowledge of Good and Evil or, more generally, sickness and death, or, more optimistically, fruition and the promise of life eternal? Is the vine lightly wrapped about the trunk meant to recall the "subtle serpent," or Christ as "true vine," or both at the same time? Who is the clothed and hatted piper standing in the "I" of "Innocence" and what is he playing--"happy songs/ Every child may joy to hear" or a melancholy ditty on how children are miseducated, strains we are forced to hear throughout *Songs*? Even more than in the frontispiece, the reader-viewer is faced here with direct challenges to his preconceptions about learning that foil any attempt he may make to formulate a coherent interpretation.

Unlike the first three plates, the "Introduction" includes both poem and illustration, its text dominates the plate, its decorative and symbolic details are few, its human forms all appear in miniature. The poem catches our eye first, but from it we gain only a general understanding of the frontispiece, our curiosity about the precise meaning of the encounter, the two characters involved, and the setting still awaiting an explanation. In fact, because of the child's dictatorial tone and increasingly complex emotional responses to the piper's playing and singing, the song ends up raising more questions about the nature of child and piper than it answers. But most disturbing are the two pairs of four interlacing ovals formed by the tree trunks that run up the left and right margins and frame eight scenes of human activity. Six of these picture common folk at familiar tasks, as if they were details snipped from genre paintings. Blake's intention seems to be to include a variety of human types and activities for the sake of variety, each of which, and all taken together, being of minor visual significance when compared to the oval frames themselves. These linked chains not only usurp the human form's claim to pictorial prominence and restrict the activities of the figures, they isolate each from each other--precisely what misapplied systems of thought and learning do to children throughout *Songs of Innocence and of Experience*.

Steered away by Blake from such systematization, each time we turn a page of *Songs* we are forced to deepen our enquiry because new questions fed by fresh cross-references arise continually. Matter and meaning, in fact, proliferate as the reader-viewer makes his or her way through all fifty-one or fifty-three or fifty-four or fifty-six plates, weighing the thematic and technical issues in one composite poem against complementary or opposing issues in others. Our direction might be guided by subject one moment and setting the next, or by character, image, speaker, tone, technical strategy, or by a combination of these--maximum play between text and design, between pairs and clusters of songs, between *all* songs being Blake's chief objective. Other variables that foul paradigmatic approaches to *Songs* include how points of coherence and points of divergence are heightened or lowered by visual and verbal positioning; how emphases vary from copies with facing prints to copies with prints on recto only; how textual breaks and subjects of companion illustrations in two-plate songs affect meaning. The great care (or lack of care) Blake takes when coloring particular prints in early and middle copies; the comparative effects of lightly washed, watercolored, elaborately colored, and colorprinted plates; and Blake's use of different colored printing inks in the same copy are technical considerations that also raise irresolveable questions about authorial intention and meaning. Such problematic variety complements the continual shifts in image, voice, tone, rhythm, and meter found throughout *Songs*, and reminds us yet again of the collection's great and baffling range of verbal and visual expression.

When weighing the helpfulness of possible literary and art historical sources, the guiding method must also be Socratic, for one rarely sees exactly the same tree that Blake sees. To test, for example, the influence of *John* 10:1-18 on songs in which Christ as Good Shepherd appears; or of the frontispiece to Joseph Ritson's *English Songs* on the frontispiece of Innocence; or of Lavater's physiognomic interpretation and accompanying illustration of a tiger on "The Tyger"; or of innumerable other suggestive analogues on the composite parts of any song, reemphasizes the imaginative range of Blake's working methods. Sometimes Blake expects us to know precisely how he is using a historical image and its context; other times he simply tries out for effect familiar or cryptic images and contexts; at still other times he deliberately avoids using an obvious image or context and assumes that we are well aware of the omission.

And to what end such harassment? In fact, intellectual vexation of these sorts simulates how the "human form divine" ["The Divine Image"] might travel beyond the boundaries set by our "reasoning power" *[There Is No Natural Religion* a5]. For in overwhelming us with variety and continually testing the possibilities of perception and the limits of logic, *Songs* encourages us to discover in ourselves what Blake termed the "Poetic or Prophetic character" [*There Is No Natural Religion* b11]. By challenging our received ideas about the health and prosperity of civilization and about what it means to be human, and by obligating us to accept responsibility for the manacles we forge in order to explain logically, and give value to, our lives and actions, Blake frees us from the tyranny of systematic thought. Because we are not spoon-fed *the* answers, we come to learn that the process of thinking inquisitively and critically is one of the surest humanizing activities in which we can participate. It is this kind of "Thought" that is "Life and Strength & Breath."

This is not to say that Blake's aim is simply to celebrate variety and process, or to destroy meaning. It is, rather, to engage us in the activity of critical thinking in order to help us discover genuine meaning and develop an attitude that might counter the desperate feelings we have about the state of the world in which we live. In *Songs*, Blake dramatizes how difficult true learning is, and how easily human beings are seduced into embracing simplistic empirical views of the world that "repeat the same dull round" [*There Is No Natural Religion* b11]. Even worse, converts to this mode of thoughtlessness often become dogmatic spokesmen for the views they parrot. Today, with the possibility of nuclear holocaust no longer a truth that was once only "imagin'd" [*The Marriage of Heaven and Hell* 8], we must believe that the "Opposition [which] is true Friendship" [*The Marriage of Heaven and Hell* 20] is that which sees beyond divisive philosophies and perceives the human in the enemy [ref. "Annotations to Lavater" #248]. Only then will we know why Blake could write that everyone is alike in "The True Man" [*All Religions are One* 10]. Approaching *Songs* (and, I would add, all creative masterpieces like it) as a work that exemplifies the virtues of open, inquisitive thought is, Blake demonstrates, the most effective way we can help initiate the "break of day" offered to us by his clear-seeing bard of *Experience*.

HUMANITIES EDUCATION CONNECTIONS

Ideas and materials for better teaching and learning in the humanities.

Editorial note: The term "global humanities" has cropped up recently, and NAHE has decided to make global humanities a major theme of our 1991 biennial convention. There are many problems of concept and content as we try to broaden the scope of traditional western humanities.

The two following articles present some of these problems for our consideration. Douglas Sjoquist discusses textbook definitions of *civilization* that seem to express western ethnocentrism even as they try to broaden the cultural scope of cultural history. John Davis, Ben Smith and Jesse Palmer take a brief definition of Australian ***aborigines*** from an elementary school geography text and show how through folklore and creative activities this spare definition can enrich the appreciation of a culture. Although the article is directed toward elementary grades, the interdisciplinary approach provides a lesson for humanities teachers at all levels.

Douglas P. Sjoquist

TEACHING WORLD CIVILIZATIONS: THE PROBLEM OF DEFINING "CIVILIZATION"

In this decade a growing number of community colleges and universities in the United States have replaced their traditional Western Civilization courses with World Civilizations courses as part of their overall effort to help students better understand the nature and dynamics of our contemporary "global village". Interestingly, the change has brought to light some issues which reflect our own ethnocentrism and subtle misoneism. One in particular is the use of the term "civilization" in teaching World Civilizations. The general tendency in teaching the Western Civilization courses has been to first define civilization and then proceed by chronologically (and geographically) identifying and discussing those cultures in the so-called Western world which qualified as civilizations according to the established definition (e.g., Greek, Roman, Byzantine, Islamic, etc.). This propensity has been carried into the World Civilizations courses and is mirrored in the textbooks used in teaching them. A brief analysis of where and how these textbooks characterize civilization will indicate not only that the approach used in teaching Western Civilization courses has been retained but that the definition itself is inherently ethnocentric. Consider the following definitions or characterizations:

> ...a stage in human historical development when writing is used to a considerable extent; some progress has been made in the arts and sciences; political, social, and economic institutions have developed sufficiently to conquer at least

> some of the problems of order, security, and efficiency in a complex society.-(Burns, et al. 1986, p. 17-18)

> ...a kind of culture which includes the use of writing, the presence of cities and of wide political organization, and the development of occupational specialization.-(Wallbank, et al. 1987, prologue)

> ...a culture that has an urban political organization and a medium for the preservation and communication of knowledge, skills, and beliefs.-(Chodorow, et al. 1986, p. 25)

> ...a form of human culture in which many people live in urban centers, have mastered the art of smelting metals, and have developed a method of writing.-(Craig, et al. 1986, p. 6)

Like most Western Civilization textbooks the above definitions all appear somewhere in the first few pages of text. Should the World Civilizations courses evolve around a definition of civilization? Many instructors would argue that defining civilization is a convenient way to begin *any* civilization course and that such an approach is especially desirable for teaching World Civilizations since it lends direction to the courses that would otherwise be unmanageable because of the enormous amount of material to cover in a term or semester. On the other hand, it would seem that shifting the focus from the Western tradition to the world entails a different set of instructional goals and a different methodology to fulfill them. Do we want our students to begin their study of World Civilizations with a spoon-fed definition of civilization or do we want them to gradually develop a global perspective which would allow them to formulate their own concept of civilization on the basis of what they've studied and learned?

One of the principal aims of the World Civilizations course is to introduce students to the evolution of civilization not as a unique European or generally Western experience but rather as a global one. It hopes that students will acquire a concept of civilization as it relates to the human experience. The definitions taken from the World Civilizations textbooks noted above do not differ in any significant way from those used in some Western Civilization textbooks. For example,

> ...that total pattern of institutions and ideas by which a large group of people conducts a collective life over a long period; ...(civilization) is characterized primarily by large political organization, complex social groups, economic systems featuring highly specialized divisions of labor, cultures marked by the expression of conscious thought in writing and a variety of art forms, and the existence of urban life.-(Harrison, et al. 1975, p. 3)

> ...a developed form of human culture based on city life, written language and law, the division of labor, and advances in arts and sciences.-(Greer 1982, p. 8)

It's apparent that the authors of some of the popular World Civilizations textbooks now available to colleges and universities find using a definition of civilization employed in some of the Western Civilization texts perfectly acceptable for teaching World Civilizations. This fact is exemplified in *World Civilizations* (Burns, et al. 1986) and *Western Civilization* (Burns, et al. 1984) which use the exact same definition of civilization.

That students in a World Civilizations course should be sold such a definition by textbooks and instructors is highly problematic. Not only is civilization ethnocentrically defined; its use undermines one of the primary goals of the course: to introduce students to different ways of thinking about the world. What these few examples taken from *both* World and Western Civilizations textbooks openly suggest is that in order for a culture to qualify as a civilization it must fulfill certain conditions. The criteria are: city life or urbanization, advanced arts and sciences, a written language, and "occupational specialization." To utilize this criteria as a measuring stick for judging whether or not a particular society in world history is "civilized" is inappropriate to say the least.

By the middle of the 15th-c. the Incas had established an impressive empire in the Andean mountains of South America. Their empire had cities, their political, social, and economic systems were complex and efficient, and their accomplishments in civil engineering were perhaps more outstanding than those associated with the Roman empire. They also excelled in a number of sciences including mathematics and medicine and, yet, never developed a writing system. Does this mean, then, that the Incas were "almost civilized" since their culture satisfied at least some of the criteria set forth in the typical definition of civilization? (I suppose one could argue that even bees and ants are "partially civilized" if the definition is accepted because in their communities labor is divided and specialized).

Should we teach our students that the ancient Indo-Aryans, who relied on an oral tradition for about a thousand years in transmitting knowledge from one generation to the next, developed a superior culture which manifested almost all the features of a civilization? No. What should be taught to our students is that the definition of civilization they may find in the beginning of their World (or Western) Civilizations textbook might prevent them from seeing the "civilized" in others. It's a product of culture-conditioning and it negatively reinforces certain biases students already have. The definition of civilization most often presented is a Western one though it might appear in a World Civilizations textbook and it perpetuates the ubiquitous use of such stereotypical terms as "backward", "primitive", "underdeveloped", and so on when cultures do not fulfill all the established conditions.

Consider another characterization of civilization:

> "I do not know where Kansas is, for I have never heard that country mentioned before. But tell me, is it a civilized country?"
>
> "Oh, yes," replied Dorothy.
>
> "Then that accounts for it. In civilized countries I believe there are no witches left; nor wizards; nor sorceresses; nor magicians. But you see, the Land of Oz has never been civilized, for we are cut off from the rest of the world. Therefore we still have witches and wizards among us."-(Hearn 1973)

According to Glinda, the Good Witch of the North, a civilization does not have witches, wizards, sorceresses, and magicians. Should these requisites be added to the criteria used to determine whether or not a culture qualifies as a civilization? Maybe, although the Land of Oz is not covered in any World Civilizations textbook. But China is. Would the Chinese define civilization in the same way that our World Civilizations textbooks do? The teachings of K'ung Fu-tzu (Confucius), for instance, are oriented around cultivating social propriety and preserving harmony between Earth, humans, and Heaven. His definition would undoubtedly be less materialistic than the one found in our textbooks. Among other things, being civilized in the Confucian sense means exercising filial piety (hsiao) and practicing benevolence (jen) towards others. How one defines civilization is relative to and conditioned by the culture he/she is part of. The definitions we find in our textbooks are Western-oriented (whether they appear in a World Civilizations text or not). They are characterizations of civilization as seen through the eyes of a Westerner and not a Glinda or a K'ung Fu-tzu.

There's another hidden danger in defining civilization in a World Civilizations course: restricting the students' possibilities for cultural enrichment. A great number of societies in world history who have made notable technological, artistic, philosophical, and religious contributions to the global bank of human cultures are often overlooked in the classroom and in textbooks because they do not conform to our provincialist view of civilized life. In addition, we tend to ignore the fact that these "primitive" peoples have frequently been instrumental in shaping the content and direction of our own Western tradition. To illustrate, the Spanish painter and sculptor, Pablo Picasso, has been regarded as one of the greatest artists of modern times. A major source of inspiration for his work, however, was the "primitivism" of Sub-Saharan African art. To define civilization, especially unaware of our own biases and culture-conditioning, is to limit the concept itself and the policy of doing so diminishes the opportunity to enhance one's global perspective and cultural literacy of the world.

A recently published Western Civilization textbook remarks that no definition of civilization is universally applicable. That's a step in the right direction and ironically World Civilizations textbooks should soon follow suit given their tendency to borrow Western definitions and methodologies. The same text then identifies four distinctive features common to the societies of the ancient Near East, presumably to distinguish those Near Eastern societies from the rest of the ancient world.

> No definition of "civilization" applies equally to all societies. For the ancient Near East, specifically, Egypt, Palestine, and Mesopotamia, however, the common characteristics of civilized life included (1) city-centered states of 5,000 or more inhabitants administered by a specific political leadership; (2) social class stratification of some sort...; (3) complex division of labor...; (4) a relatively high level of artistic and intellectual development, large scale architecture, sculptural and pictorial representations of human activities, and written materials.-(Goff, et al. 1987)

Despite the authors' sincerity in rejecting the universality of any one definition of civilization their characterization of civilized life in the "cradle of civilization" still does not escape the Western proclivity to interpret and define things materialistically. It should give us and our students an insight into our own values, the highest of which seem to lie in material well-being and in the advancement of material progress.

BROADER UNDERSTANDING OF CULTURES THROUGH FOLK LITERATURE

Effective citizenship is a primary goal of social studies at all levels of instruction. In a world that is increasingly interdependent, effective citizenship will require students with skills and understandings about a variety of cultures. Because most textbooks are limited in breadth and depth of information and written for one reading level, teachers need to employ additional readable literature that will expose students to other cultures. One teaching strategy which can be used to help students develop an awareness of different cultures is integrating children's literature into the social studies curriculum. Our specific suggestions refer to elementary grades, but the concepts and techniques are adaptable throughout the educational spectrum.

Folklore is a type of literature which greatly appeals to students (Norton, 1987). It can be used to help students examine how people are affected by their backgrounds and surroundings and to explore explanations posed by native peoples. It provides a glimpse into explanations cultures use for some natural events. Folktales may be used to stimulate interest in one aspect of a culture and thus be a stepping stone to an in-depth examination of how cultures explain other aspects of their world.

Integrating literature into the social studies curriculum is not a new idea (Cline & Taylor, 1978; Levstik, 1983, Odland, 1980). Such an incorporation is sometimes referred to as collateral reading (Logan, 1980). The central point of collateral reading and other effective teaching techniques is for the teacher to provide connections between the personal world of the students and the world which is addressed by the social studies curriculum.

Folklore has been used as a vehicle to transmit knowledge from older to younger generations in many different cultures. The survival of folklore over the centuries is an indication of the high interest and importance it holds for its tellers and listeners.

Folk literature is presented in a direct and simple style which shows action and colorful characters that appeal to all levels of readers. It informs the reader about the ethical and moral values of the culture that produced it. According to Levstik (1983), children will read and discuss literature. Their understanding of human diversity and world cultures is rooted in the literature they experience. In a similar vein, Huck (1987) observed, "Literature has the power to educate both the heart and mind."

To integrate folklore into the course material of a social studies class requires the incorporation of a strategy for using literature in the social studies curriculum. The following scenario is suggested for an extension of an Australian unit in which folklore and a school textbook are the primary sources of materials. The textbook is *Geography of States and Regions* (grade four) published by Silver Burdett and Ginn, p. 242, 1988 edition. Here is what this text said about the Aborigines:

> **Settling Australia** The first people to live in a country are called **aborigines (ab ə rij' ə nēz)**. Australia's aborigines probably came from southwestern Asia. For hundreds of years these people lived by hunting, fishing, and gathering roots and other plant food. Relatives of Australia's aborigines still live in the country. However, they make up only a very small part of Australia's people today.

The teacher can enhance the passage by inquiring about students' present knowledge of Australia and the Aboriginal people:

1. Locate Australia on a globe and a world map.

2. Place Australia in relation to the United States, i.e., latitude, distance, neighbors.

3. Identify the first people to live in Australia.

4. Describe how the native people lived.

After discussing the students' strengths and weaknesses concerning their knowledge about Australia, the next step would be to integrate resources in a meaningful application to extend the students' knowledge about Australia and the Aborigines. Since the native Aborigines were given only a small paragraph in this specific textbook example, the following extension of the basic text is suggested:

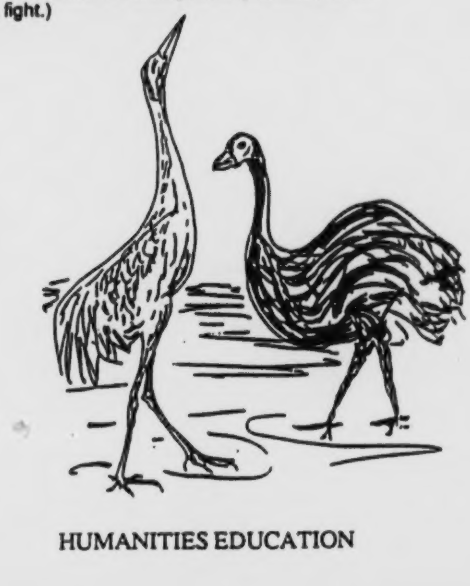
"Goo-Goor-GaGa, the Laughing Jackass" was rewritten by the authors and adapted from "How the Sun was Made" from *Australian Legendary Tales* (Parker, 1966). This folktale provides a number of learning opportunities. One approach would be to present the tale through a readers' theatre. Numerous folktales lend themselves to use in a readers' theatre. Students might divide tales into parts and develop scenarios similar to the following.

Goo-Goor-Gaga, The Laughing Jackass

Legends and folk tales are a part of the Pacific Rim culture. They are handed down through the years and give us some insight into the culture of different people. Here is a legend told in Australia by the native Aborigines.

CHARACTERS: Dinewan (the emu), Brolga (the crane), The Egg, The Good Spirit, Goo-goor-gaga

NARRATOR: Long ago the land was filled with darkness. Only the moon and stars watched over the birds and other animals as they flew and roamed on the plain near the Murrumbidgee River. One day a loud disturbance was heard on the plains. (It was two birds having a fight.)



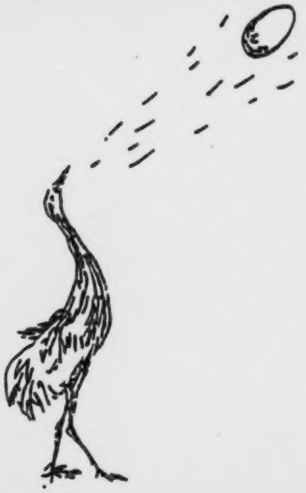
DINEWAN THE EMU: You are getting too close to my nest, Brolga. Can't you see that I have some eggs that have not hatched?

BROLGA THE CRANE: (Getting a little angry) Dinewan, you are always protecting your eggs. All we're trying to do is have some fun in the water. (At this moment, Brolga moved closer to the eggs.)

DINEWAN THE EMU: If you come any closer to my nest, I will peck your eyes out. (This made Brolga angry.)

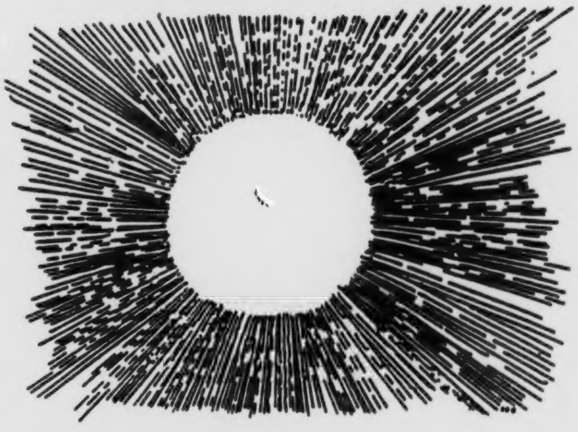
NARRATOR: Brolga waded to Dinewan's nest and grabbed one of the eggs.

THE EGG: Please don't harm me. I want to grow up to be a big emu. (Just as Dinewan reached to get the egg back, Brolga hurled it into the sky.)



NARRATOR: The egg cracked on a pile of wood and somehow the yellow yolk from the egg caused a great fire to occur. The animals below were astonished because they were accustomed to only darkness. The Good Spirit who lived in the sky noticed what was happening.

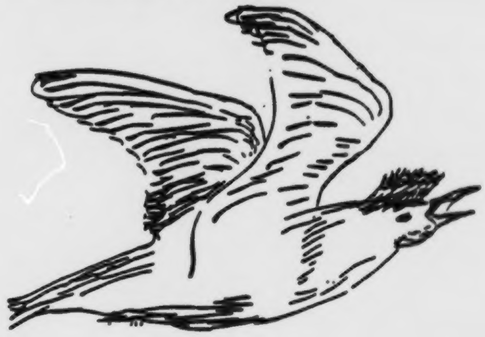
GOOD SPIRIT: What is that bright light? Now I can see the earth below so clearly. It is beautiful.



NARRATOR: The Good Spirit thought it was a good idea to have a bright light everyday. So every morning, he would send out the morning star to warn those on earth that a new fire was about to brighten the sky. However, this warning proved unsuccessful because most of the inhabitants were still sleeping when the morning star appeared.

GOOD SPIRIT: (Looking concerned) We need something that will make a noise to wake up those sleeping. What can we do? (Suddenly there was great laughter) Who's there?

GOO-GOOR-GAGA: I'm Goo-goor-gaga the laughing jackass. I love to fly around making loud noises. How can I help you, Good Spirit?



GOOD SPIRIT: Every morning I want you to laugh your loudest so that all the sleepers will awaken to see the sun. If you won't do this then the sun will shine no more.

NARRATOR: The Goo-goor-gaga saved the day. He agreed to laugh every morning to bring in the break of day. Ever since then if you listen very carefully during the early morning you can hear his laughter.

GOO-GOOR-GAGA: Goo-goor-gaga, Goo-goor-gaga, Goo-goor-gaga.

NARRATOR: Thanks to the Goo-goor-gaga we have a sun that burns all day. Children should not mock his laughter or he might stop laughing and the sun would stop shining. Children beware! If you laugh like the Goo-goor-gaga, you might grow an extra eye-tooth.

RESOURCES: This story was adapted from "How the Sun was Made" in *Australian Legendary Tales* collected by K. Langloh Parker (The Viking Press, 1966). Selected and edited by H. Drake Brockman.

VOCABULARY BUILDER:

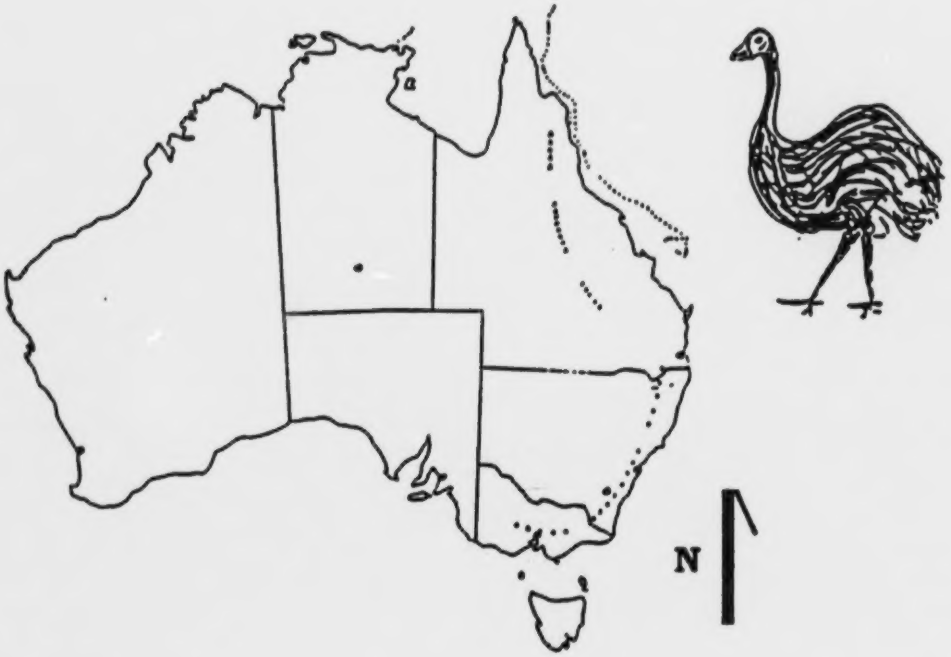
CRANE: A tall wading bird.

EMU: A flightless Australian bird smaller than the related ostrich.

MURRUMBIDGEE: A river in New South Wales located in the Southeast corner of Australia.

GEOGRAPHIC SKILLS:

Below you will find a map of Australia. Show the Emu where the following places are located by writing their names on the map. New South Wales, Victoria, Queensland, South Australia, Western Australia, Northern Territory, Sydney, Melbourne, Brisbane, Perth, Darwin, Adelaide, Canberra.



READERS' THEATRE

Students are selected to read the parts of a story, somewhat like a play. A script for each reader and a large name tag will be needed to identify each reader's role. The teacher introduces the tale and focuses students' attention on the location and characters of the tale:

> Have you ever been told a story about something that happened a long time ago?
>
> This is an old tale which is told in Australia by native Aborigines.
>
> It is about an event which was a concern to those ancient people.
>
> What do you know about Australia?
>
> What animals come to mind whenever Australia is named? (kangaroo, koala bear, duckbill platypus)
>
> Can anyone describe an emu? (a large ostrich-like bird)
>
> How can you identify a crane? (a long neck and long legs)
>
> Where do cranes and emus live? (cranes live near water in many parts of the world; emus are native to Australia and they are found in some American zoos)
>
> What is a good spirit? (does good, not evil)
>
> How would a goo-goor-gaga look? (a bird with colorful feathers, a kingfisher)

The story we are about to enact was told by the Aborigines, the people who first lived in Australia. Like many other primitive people throughout the world, Aborigines explained some natural events with stories such as "Goo-Goor-GaGa, the Laughing Jackass."

This story is told by a narrator and five characters. Following the introduction, give scripts and name tags to each reader. Introduce each reader/character and have the narrator begin to read--with feeling. At the conclusion of the readers' theatre exercise, the teacher can venture in several different directions (as indicated in Figure 3) to extend the material and teach the students more about the Aborigines and Australia.

This sort of "webbing strategy" is clearly applicable in any teaching situation where the objective as *an historic understanding of another* culture, whether it be classical Greece or eighteenth-century France. How many threads one wants to follow depends upon the classtime available, the institutional setting, and, of course, the educational objectives of the particular course.

One outcome of this experience with folk literature will be for students to establish that day and night were very important to Aborigines, who lived under the stars, subsisting by hunting and gathering. For the Aborigines, life's necessities were intimately related to the passing of each day.

Evaluation of this readers' theatre experience might be done by observing student response to discussion and questions. Some printed question items would be prepared from the text and students can be provided enlarged copies of the "Geographic Skills" activity. Students complete the activity with the aid of an atlas. An outline map of the world with location problems will extend the activity.

It is important that the teacher, as a primary source of information, have some basic knowledge about literature. A unique reference tool is *Reading Ladders for Human*

Relations edited by Virginia Reid for the National Council of Teachers of English. This publication gives annotated reviews of books around four basic themes, one of which is the appreciation of different cultures. *Social Education* provides an annotated list of "Notable Children's Trade Books in the Field of Social Studies"; each book is categorized and assigned to primary, intermediate, and advanced audiences. Two other guides to children's book collections are *Children's Books of the Year* and *The Best in Children's Books*. Four major library periodicals review new books that can be useful for keeping up-to-date: *The Booklist*, *The Bulletin of the Center for Children's Books*, *The Horn Book Magazine*, and *The School Library Journal*.

From a story such as "Goo-Goor-GaGa" students may choose to read more Australian Aborigine folktales and examine the rich folklore of other cultures such as Native American, African, and Southeast Asian, etc. As students develop some understanding of the world's diverse cultures, the social studies/literature approach should be integrated with writing and art activities. It lends itself to integration with language, science, and social studies activities. Folklore provides pleasure for readers as it reveals how different cultures address human needs.

Folk literature can expand our students' knowledge and therefore their understanding of little known cultures; consequently, by these means we are helping them to become more effective citizens in this pluralistic society. Although a fourth-grade social studies topic has been the focus of this article, the idea of moving beyond the textbook is critical to helping all students to connect with their world. Literature--folk or cultivated--provides an opportunity for students to access their own heritage and that of other cultures, to consider divergent views of phenomena, and to critically examine events. The relationship of subjects may be demonstrated through Hesse's *Siddhartha* when we address the geography, history and religion of the East; through Mark Twain's *A Tramp Abroad*, when we consider a nineteenth-century man's view of Europe; and similarly through numerous other literary works. Classroom teachers from primary grades to university classes can help their students see the interconnectedness of subjects through literature.

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

BOOK TALK

"Let's Talk About It: Lessons in Adult Humanities programming" by Joan C. Durrance and Rhea J. Rubin in *Public Libraries* (Mar/Apr 1989). ALA, 50 E. Huron Street, Chicago 60611. $10/single issue.

"Let's Talk About It" is a project administered through the American Library Association which was funded to the tune of $1.5 million by NEH during the years 1983-1987. The program is still available, but this article reports on what happened during the pilot years and provides lessons learned over those four or five years. Basically it is a book discussion program for adults, but unlike the Great Books Program, (which has been going for forty years) "LTAI" is not on the classic canon, and rather than being year-long discussions, these are ten-week series on a given theme. Also, unlike Great Books which uses lay discussion leaders, LTAI uses humanities scholars who provide a half-hour keynote before the participants divide into discussion groups. The scholar, Durrance and Rubin report, "was the glue that held the series together," but discussion leaders were also important.

Ten themes were provided, ranging from "Work and Its Rewards in a Changing America" to "Myth-Making in Popular Fiction" and "Contemporary Japanese Literature." The statistical report on participants in over 300 communities in thirty states showed that the typical participant "was a well educated white female, thirty-six to forty-five years old, who regularly used the public library and who had limited recent experience in reading discussion groups." (That's 93% white, 82% female, 87% with some college education--68% at graduate level.)

Libraries face several challenges if they are to continue or initiate Let's Talk About It programs without NEH financial backing. One is whether to try to expand the demography beyond the pattern described. The others relate to the various components--such as how to have enough copies of the books available and finding appropriate scholars and discussion leaders. The keys to all of these seem to be careful planning with firmly established community support. The authors, who are a library school dean and an independent library consultant, provide more detailed strategies in the article, and recommend that interested persons buy the $8 Let's Talk About It preview kit from ALA (address above, Attn: Sally Mason) which includes the ten theme pamphlets and ideas on how to establish independent book-discussion programs. (F.S.)

CANONS ROAR

"Peace Plan for the Canon Wars," by Gerald Graff and William E. Cain. *The Nation*, March 6, 1989 (Review by Sharon Scholl)

Like good television news commentators, Graff and Cain give a blow-by-blow description of the contenders, their slogans, and their weaponry. They also reflect upon the history of a war that sounds vaguely reminiscent of the Irish-English dust-up. In their view the present contentions are not academic dissentions caused by varying reading preferences but "a conflict over society's vision of itself."

As background, the writers point out that the current confrontation is simply one in a series that started when English and American literature displaced Greek and Latin writing at the center of the college curriculum. Another skirmish ensued over inclusion of "modern" literature on an equal footing with more time-tested models. Even the departmental categories of literature are a bureaucratic nineteenth-century hand-me-down replete with nationalistic overtones.

For a description of the battle lines, Graff and Cain summarize the revisionist side as a quest to revive the issue of value and raise again questions as to what constitutes "good" and "bad" literature. The conservationist side complains that already so many concessions to varying political pressures have been made that the curriculum has lost coherence and conviction, leaving students to wonder what they are supposed to know and why it makes any difference.

After the diagnosis comes the analysis. In reality, according to a Modern Language Association survey, the core of the literature curriculum is still dominated by Chaucer, Shakespeare, and their ilk. It is at the fringes in the elective courses that real innovation can be noted. And herein lies one proposed model for action: simply keep adding courses. However this possibility tends toward greater expense and more proliferation at a time when the hue and cry is for tighter structure and greater coherence. Model number two is maintaining two curriculums, one for the traditionalists and one for the revisionists, practical only in well-heeled research-oriented institutions. One can imagine the political in-fighting as the best students are politicized in the struggle for warm bodies to fill the classroom chairs.

The model of action the authors suggest as terms for truce is certainly creative, consisting simply of teaching the conflict. Why not, they reason, let the students into the battle; show them the vigor of academic debate? Issue the guns and ammunition and let them join the war. "The point of such (study) would be neither to discard nor deify the traditional classics but to put them into relation with the texts and ideas now challenging them." The basic questions of literary study would involve the differences between high and low culture, changing estimations of selected classics and the controversies that once surrounded their enshrinement. Centering literary studies around vital issues involved in the present conflict would lend the coherence the traditionalists demand, while allowing "classics" to be approached in the full context of the creation and vicissitudes of public acceptance, and criticized by newer works which may be abrasive of the world view of the older one.

The writers disclaim a position of neutrality in offering their truce, and identify themselves as leaning leftish: their goal is "a democratic culture in which traditions are not simply given or fixed but are open to criticism and renegotiation." They simply urge the contenders to bring their differences out in the open, allowing students a part in the debate, and thereby recreating literature as the vital, ornery, and exciting study it should be.

VERBAL & VISUAL

"Visual Literacy: A Liberal Art" in *Perspectives* Spring 1989. Association for General and Liberal Studies, Penn State York Campus, York PA 17403. $30/year.

Humanities courses tend to be of two kinds, the "great books" heritage of verbal literacy, and the multisensory cultural heritage that augments the verbal tradition. Both are interdisciplinary. The first ordinarily combines philosophical and political treatises with *belles lettres* andthis does require a good deal of learning of the techniques for reading very different kinds of verbal discourse. The second, though, requires other kinds of literacy, such as "reading" visual works. Curtiss, who is the author of Introduction to Visual Literacy, argues that training in visual literacy is woefully ignored, despite the fact that today's students are constantly bombarded by visual messages to the point of being desensitized. They do not recognize that watching uncritically is the same as reading words without any understanding of the techniques and processes involved.

We should not throw out the baby with the bath water, however. Verbalizing is essential because it is our best human tool for analyzing, comparing, synthesizing and communicating. The "interaction of the verbal and visual...should be a commonplace educational experience from birth onward." One method is to have students perform graphic analyses of magazine pictures at the same time that they are examining important historical visual works. The purpose is to familiarize them with the elements of visual literacy: compositional principles, style, and content interpretation. Curtiss also maintains that visual *expression* is equally important. We should no more think of teaching reading of visual data than we would teach reading words without writing: "Through active creation of visual statements one comes to perceive and know a wealth about the world in which we live, as well as appreciate the visual statements of others." This includes drawing, of course, but also the ability to take a decent photograph and to use computers and video equipment. (F.S.)

VERBAL & PHYSICAL

"The Rhetoric and Aesthetics of Haphazard Landscapes" by David Scofield Wilson in *Landscape* 30:2, 1989. P.O. Box 7107, Berkelon CA 94707. $22/year.

It is almost a cliché of humanities textbooks to speak of buildings and plazas as being expressive of a culture. It works well with the Parthenon, Chartres cathedral, Red Square, the Boston Common. But what of ordinary places? Interpretation of vernacular places is a new, evolving field of investigation, and, as Wilson, who teaches at University of California, Davis shows, it is a difficult topic. The case-study of this article is the Yuba-City-Marysville area of north-central California which was ranked by Rand McNally in 1985 as one of the worst places to live in America.

The citizens' responses to the bottom ranking were varied, but all reflected a grassroots pride of place. The only real sym-

1178

bolic locus of the area is the Sutter Buttes--America's "smallest mountain range"--about which there are many traditions from American Indian beliefs to controversies about public access. This then is the backdrop for Wilson's concepts of the "rhetoric and aesthetics" of undistinguished places. The verbal term "rhetoric" may seem misplaced, but Wilson reminds us that places may "tell a story" or "make a statement." Some are carefully contrived narratives, as in the Stations of the Cross, where a Christian (especially a Roman Catholic) is equipped with vocabulary, grammar and rhetorical conventions to receive the full message. Other designed places may not have so a clear narrative as a religious place, a museum, an historical site or a theme park, but it is certain that a Le-Corbusier cityscape or a Frank Lloyd Wright house and estate "speaks unambiguously to those who know the language and rhetoric of...the landscape of formal design."

Vernacular landscapes have not the classical unity of formal designs, but nevertheless there is an underlying logic to such places as a middle-class American residential street, a farmyard, a carnival midway, or even an auto junkyard. But, Wilson says (deriving concepts from John Brickerhoff Jackson's *Discovering the Vernacular Landscape*) there is a third kind of place that increasingly affects America--haphazard, violating and mixing traditions with churches converted to discotheques or Vietnamese restaurants, downtown streets as arenas for joggers, sewage settling ponds turned into wildlife sanctuaries, and mall parking lots where the pretense of streets and rules of the road are ignored at the whim of any drivers who care to cross lines. "No single rhetoric, or at least no rhetoric that restricts us to a single perspective, is adequate to convey the elan and slapdash creativity of such contemporary landscapes." The only common denominator is the people, who are making it up as they go along. (F.S.)

SHAVE & A HAIRCUT

"The Ancient Egyptian Marketplace" by Frank Yurco in *Field Museum of Natural History Bulletin* February 1989. Roosevelt Road at Lake Shore Drive, Chicago 60605-2496. $6/year.

"But how did *ordinary* people live?" is a question that is often asked as students study great artists, monumental buildings and powerful leaders of the past. For some civilizations, archaeology provides the only answers, and often the remains are spotty and highly selective. A recently opened exhibit at the Field Museum provides a particularly full narrative and anecdotal picture of a market place of about 2450 B.C. The wall paintings on which it is based survived rather strangely. They were on the walls of a tomb of two barbers (who had risen to being barbers to the pharaoh), but the tomb didn't last long. It was in the way of a causeway to the pyramid complex of a later pharaoh, was demolished, and the blocks became part of the causeway, not to be discovered and reconstructed until 1975.

This article has a replica painting of the scenes with interpretations. We see a variety of skin colors, reflecting the multi-ethnic character of Egypt of the Old Kingdom, something not previously observed so clearly. The barbers and their assistants are shown giving haircuts, facial and pubic shaves, manicures, pedicures and massages. We see policemen with police baboons, one of whom is biting a shoplifter ("Catch, catch?" says the cop; "Get him off me; I'll desist from doing wrong!" says the robber); the other police-baboon is pilfering fruit to the humorous protests of the merchant.

1179

Other scenes show bread-merchants, a female tavernkeeper selling beer to a customer who says, "Fill it up; though I'm filled, the barley beer is of excellent quality." Most customers carry shopping bags, and other merchants sell vegetables (green onions, romaine lettuce, garlic), fish, pottery cups, copper vessels, seals (for validating documents, etc.) and linen cloth, which we can see being measured in the way that rough measurements of yardage is still done. Because the scenes have references to prices and measures, there are excellent connections with economic comparisons. These scenes are the first evidence of the use of gold, silver and copper as exchange mediums in the Old Kingdom (although actual coinage was not introduced into Egypt for another 2000 years, by Greek merchants). (F.S.)

Do you have a "great classroom handout" to share with our readers? A reading guide to the Iliad? How to listen to a symphony? A writing assignment that really teaches critical thinking? A sure-fire discussion format?

Send it to us, with a page or two about the context, the record of success, the potential for converting to other uses, etc.

We'll publish as many as we can as space is available.

NAHE MEMBERSHIP

Why not share membership information with your colleagues in your college or university, elementary or secondary school, state humanities council, historical society or museum? Many of them are looking for just such an organization as NAHE. Copy the NAHE application form on the last page and pass it on to them.

Prepaid individual membership and institutional subscriptions are $16/year. (If you require invoicing or special billing, the rate is $20.) Your payment will be acknowledged, notifying you when to expect your first issue of **HUMANITIES EDUCATION**. We are able to maintain the low $16 membership by printing only as many copies as there are paid memberships, so it is important to join now! Mail this form and your check to:

1989 ASSOCIATION FOR HUMANITIES EDUCATION CONFERENCE

The association held its biennial conference April 20-22, 1989 in Kansas City, Missouri in cooperation with the University of Missouri-Kansas City College of Arts and Sciences Continuing Education Division, the Nelson-Atkins Museum of Art, the Kansas City Art Institute and Missouri Western State College. The program included a rich variety of formats: round table discussions, papers, workshops, panel discussions, formal lectures and a special viewing of the Thomas Hart Benton retrospective at the Nelson-Atkins Museum of Art. Discussions carried on from the more formal sessions into the social receptions and coffee shop, indicating the degree of intellectual stimulation the conference provided.

The sessions were not only well-attended, but open and lively in discussion and exchange of ideas. Program chairman Jim Mehl provided a wide-ranging spectrum of topics. A sampling of the sessions included "Challenges in Teaching World Humanities"; exploration that began with a paper entitled "Redefining the Humanities for the Post-Modern World" and ranged over "World History and the Humanities" and "Asia in the Western Humanities Tradition." Other sessions examined "New Methodologies in Teaching the Humanities"; "Science, Technology and Teaching the Humanities"; "Teaching Business Ethics." An evening lecture on Kansas City Jazz preceded a tour of some of the city's jazz clubs on the final evening of the meeting.

The 1991 Conference will be held in Lafayette, Louisiana in cooperation with the University of Southwestern Louisiana. Scheduled for late April to coincide with south Louisiana's Festivale Internationale, the conference will focus thematically on "The Global Humanities." The Festivale Internationale will provide a background of international music and food to set the scene for sessions examining the Humanities in a global context. Ideas for sessions and papers should be sent to Darrell Bourque or Vaughn Baker, University of Southwestern Louisiana, Lafayette, LA 70504.

MINUTES
OF THE BIENNIAL BUSINESS MEETING OF NAHE
8:00 a.m., April 22, 1989; Plaza Hilton Hotel, Kansas City, Missouri

The meeting was called to order by President Fred E. H. Schroeder. The Executive Committee reported a recommendation that annual dues be raised from $16 to $20. This will go into effect in January 1990, but opportunities for current members to renew and extend their memberships at the old rate will be advertised in the fall of 1989.

The rationale for the rise is primarily a response to inflation in publication and mailing costs. Although NAHE is quite solvent, the bank balance has gradually diminished during 1988-1989. The policy of using funds only for publications and membership campaigns has been adhered to, except for providing printing and mailing seed money for the Kansas City Conference.

The Executive Committee has continued to work on a streamlined system of governance for the Association. The goals are to have a small number of officers allowing for ease of consultation, but to broaden opportunities for participation by all interested members. A revised set of By-Laws should be ready for members to consider by Spring 1990.

The Executive Committee has been examining several possible sites for the 1991 biennial meeting. A strong proposal by our members at Southwestern Louisiana State University prompted the decision to meet in Lafayette, Louisiana in the heart of Cajun Country on April 19-21, 1991. The conference will emphasize Global Humanities.

The Nominating Committee presented the name of James Mehl, Professor of Humanities at Missouri Western State College in nomination for the position of Vice-President/President-Elect. There were no nominations from the floor and a motion to cast a unanimous ballot was carried.

Before passing the gavel to President-Elect Sharon Scholl, Schroeder expressed the deep appreciation for the two years of work by Jim Mehl on planning the Kansas City conference. President Scholl presented a plaque to Fred Schroeder in the name of NAHE thanking him for years of "inspired leadership."

The members discussed new directions for NAHE in general terms, and Sharon Scholl asked those present to assist in distributing and collecting an informal questionnaire for all members attending the conference.

The meeting was adjourned at 8:45 a.m.

NAHE: Ideas for Present and Future

A Note from the new President, Sharon Scholl

The Kansas City conference was a stellar event, thanks to Jim Mehl and his planning committee. It was a good beginning for the next two years of our newly installed leadership pattern with me as president, Jim Mehl as vice-president, and Fred Schroeder as executive secretary and publisher. Most people at the conference responded to a survey which we distributed on the state of the NAHE organization and our projections for the future. Here are some of the results. There was quite positive agreement that the HUMANITIES EDUCATION magazine is just what we want it to be, and that conferences every other year are about right for frequency. Comments suggested central-to-the-nation locations with large enough airports to provide for a variety of carriers. As to the structure and function of our organization, there is the matter of a set of constitution and by-laws that are not in step with what we are at present. Revisions need to be made and the Board of Directors is examining suggestions now. If any of you have experience at such matters and would like to undertake this revision, please contact me for a set of current papers.

As to the future, some matters were checked by respondents as particularly important to them. The place of the humanities in global studies was such an issue, and will be adopted as the theme of the next conference. Teacher certification in interdisciplinary humanities was another often checked item. NAHE has a set of guidelines which are now well out of date but which may be used as a structural model. I am going to assemble a committee of six people (high school and college representatives) to do this work. Please let me know if you are interested in being a member of this research group.

Most of our respondents do not need a "stable" of curriculum consultants on call for advisement, but the few who do need it urgently. We could solve this dilemma quickly and efficiently simply by asking those of you who would be willing to aid another humanities teacher to send me your name, a one page vita, and the specific area of humanities in which you could be most helpful. We can then run this list once a year in HUMANITIES EDUCATION, updating and adding as we go.

The only other item which received significant responses was to make available a national clearinghouse of course outlines, bibliographies, audio-visual lists, etc., that integrate with historical or thematic courses. This is also a problem easily solved if each one of you would send me full particulars of any courses you are teaching, whether standard historical epoch types or something more specialized. We could, again, run an annual list of courses available for the cost of Xerox, or offer a disk with the whole lot included for minimal cost. We particularly need materials on successful high school courses to share. Fred Schroeder reminds me of the "Great Classroom Handouts of the Western World" section in HUMANITIES EDUCATION.

There were other interest-options listed: national assessment exams for interdisciplinary humanities, contemporary literary theory, "crisis of the canon" strategies, and instructional models for non-traditional students. Only a smattering of interest in these options was elicited. Are there other important issues in which we should take part?

I am realistic enough to understand that for many of you a timely and useful magazine and an inspiring conference are all you really need from NAHE. However, there are matters of national import with which only an organization having national representation can be effective. We are that group, and it is up to us to make the best contribution we can. Times have not been this good for interdisciplinary humanities in almost twenty years. Once again national interest in education is high. The regressive forces of so-called "basic" education which stripped many school systems of their enrichment programs has abated. The call for excellence, the pressing need for global interests and interdisciplinary ventures are now the vanguards of education at all levels. At last they are singing "our song" and we have to be there to supply the music. The gist of my remarks is to get each of you involved in the forward movement of NAHE. *You* will be the ones to recommend national teacher certification standards; *your* curricular designs will be the ones looked at by instructors wishing to "do humanities"; *you* will be the ones to offer the necessary advice to others just now joining our great adventure. Let me hear from you so we can get the ball rolling.

INSTITUTES, WORKSHOPS, CONFERENCES, ETC.

The Association for Integrative Studies will sponsor a pre-conference workshop on "Interdisciplinary General Education Curriculum and Program Development" October 11-12, 1989 at Sonoma State University, Rohnert Park, California.

In response to increasing requests for assistance from colleges and universities initiating or expanding the interdisciplinary portion of their general education requirement, the Association has scheduled this workshop preceding its eleventh annual conference. Workshop sessions will be held on curriculum development in the humanities, social sciences and natural sciences, on administration of interdisciplinary programs, on teaching techniques for interdisciplinary education and on evaluation and assessment of interdisciplinary programs. Session leaders are experienced consultants as well as seasoned interdisciplinary teachers or administrators. They include Anne Brooks, Chair of the Department of Humanities at

Eastern Kentucky University, Beth Casey, Director of the Center for Academic Options at Bowling Green State University and Karl Schilling, Associate Dean of the School of Interdisciplinary Studies at Miami University.

The workshop will be limited to thirty participants. For further information, persons interested in attending the workshop should contact Professor William Newell, School of Interdisciplinary Studies, Miami University, Oxford, OH 45056. Tel. (513)529-2213. Workshop participants are encouraged to attend the Association for Integrative Studies conference which starts immediately after the workshop and continues through Saturday, October 14. The conference theme is "Integrative Education: Achievements and Consequences."

CALLS FOR PAPERS

SEVENTH BIENNIAL NEW COLLEGE CONFERENCE ON MEDIEVAL-RENAISSANCE STUDIES

March 8-10, 1990 Sarasota, Florida

Call for papers: All aspects of Europe and the Mediterranean before 1600, any discipline. Especially interested in Italian Studies, Medieval/Renaissance Humanism, Courtly Culture, Ritual and Drama, Spanish Studies, Urban History and the 12th Century Renaissance. Send a one-page abstract by December 1, 1989 to: Lee D. Snyder, Director, Medieval-Renaissance Studies, New College of USF, 5700 N. Tamiami Trail, Sarasota, Florida 34243-2197.

THE CORE AND THE CANON: A NATIONAL DEBATE

Proposals are requested for possible presentation at a conference on this subject to be held in October in Denton, Texas. Contact: Gustav Seligman, Department of History, University of North Texas, P.O. Box 13735, Denton, Texas 76203.

THE HUMANITIES IN THE COMMUNITY COLLEGE CURRICULUM: THE QUESTION OF APPROACH

Proposals on this theme are requested for presentation at the convention of the Virginia Community College Association to be held in October in Roanoke, Virginia. Contact: S.B. Olorounto, Division of Humanities, New River Community College, P.O. Drawer 1127, Dublin, VA 24084. Tel: (703)674-3600.

THE SOUTHERN CONFERENCE ON BRITISH STUDIES

The Conference will hold its annual meeting October 31-November 3, 1990 in New Orleans, Louisiana in conjunction with the Southern Historical Association. Proposals are requested by October 15, 1989. Contact: John A. Hutcheson, Jr., Division of Social Science, Dalton College, Dalton, GA 30720.

THE COUNCIL FOR EUROPEAN STUDIES

The Council will hold its Seventh International Conference of Europeanists in Washington, D.C. on March 23-25, 1990. Submit proposals by October 16, 1989 to: Council for European Studies, Box 44 Schermerhorn, Columbia University, New York, NY 10027.

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity**, **humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

Todd A. Britsch

TRAPPED BY A METAPHOR: "DEPTH AND BREADTH" IN HUMANISTIC STUDIES

> *". . . Goethe would have been the last person to approve the kind of restricted scholarship that is proposed in some academic disciplines. . ."*

None of us who approaches the humanities in an interdisciplinary way can have escaped challenges to our enterprise from those who claim that both our scholarly work and the training we give our students cannot uphold the standards of rigor that are the norms of individual disciplines. The argument usually insists that mastery of tools and bibliography is only possible within the limited subject matter of a specific field and that attempts to range beyond such limitations inevitably result in superficiality and dilettantism. The traditional metaphor used to describe the kind of learning that single disciplines provide is "depth." And because its connotations are more persuasive, the Latin "profound" is often substituted for the Germanic "deep." Few scholars would object to having their knowledge of a subject so described.

Unfortunately, many of us whose work is interdisciplinary are prepared to concede the metaphor "depth," with all of its connotative baggage, to the single discipline. Thus when asked to justify our enterprise, we answer that our responsibility is to supplement the single discipline's "depth" with "breadth." Rarely, I believe, would we concede the synonyms that are sometimes attached to the word "breadth"--"shallowness" or "superficiality"--but that is not necessary. Usage has already introduced them into language practice. (Of course "breadth" is often used in a positive way, but such usage is not automatic.) Academic work whose professed purpose is to provide breadth is almost automatically assigned an inferior position to that whose eventual goal is depth.

In this paper I argue that the application of the metaphor of depth to single disciplines is not only harmful to the interdisciplinary exercise, but that it is inaccurate in describing the nature of humanistic interpretation. I claim that most of the information needed to gain a deep understanding of a text or work of art can be gained only through interdisciplinary approaches. In addition, I will try to show that even within the individual disciplines, much of the most important work is interdisciplinary by nature.

My first serious contemplation of the depth-breadth metaphor came during the initial year of my teaching career. Although I had received an interdisciplinary degree, I still found myself unprepared for the range of material I was expected to teach in my introductory courses. One evening, in a desperate attempt to stay ahead of my students, I was rushing through the last part of Dante's *Paradise*. As I contemplated the role of Beatrice and the Virgin and read the long speeches of Bernard, the material struck me as surprisingly familiar. Finally I realized that the end of *Paradise* is strikingly similar to the concluding passages of *Faust II*, a work to which I had devoted independent study during my graduate program. The more that I thought about the subject, the clearer the parallels appeared and the more excited I became. Finally I called a colleague in the German department, the Goethe specialist who always taught the *Faust* course. "What's the relationship of *Faust II* and Dante's *Paradise*," I asked. His reply both astonished and delighted me. "I've never read Dante," he said, "but I don't know of any relationship." I was astonished because in those days before "canon" became a dirty word I thought that all senior humanists must have read Dante. But my delight that I might ahve discovered an important relationship sent me to the library with visions of *PMLA* dancing in my head.

As those of you acquainted with the extensive *Faust* bibliography would guess, I immediately met with disappointment. There were literally dozens of articles and at least two books on the Dante-Goethe relationship. But a question lingered in my mind--why was the knowledge and insight that I had gained into *Faust* through my reading in multiple fields termed "breadth" and thus not given the status of the knowledge and insight of my colleague who had restricted his reading to a single discipline? Was his understanding of *Faust* more "profound" than my own? I did not think so then, and I do not think so now.

My thinking on this matter over the past twenty years has often come in the context of Goethe and particularly of *Faust*. I have become convinced that Goethe would have been the last person to approve the kind of restricted scholarship that is proposed in some academic disciplines; moreover, I believe, even within *Germanistik*, almost all of the really important studies of Goethe are by their very nature interdisciplinary. The first point can be easily illustrated by looking at Goethe's life and works. He was trained in law, but his biological theories caused Darwin to call him a "forerunner." While directing a theatre, he wrote a theory of color that rejected Newton's ideas about light. His discovery of the parallels between part of the jawbone and the intermaxillary bone of apes completed one phase of comparative anatomy. Although he rejected much of formal philosophy, he shows good insights into Kant and Leibnitz and is perhaps the most profound interpreter of Spinoza. His essay on the Strassburg Cathedral is often cited as the first stimulus toward a reevaluation of medieval art and ultimately as a source of the gothic revival, and his art historical writings--particularly in the *Italian Journey*--are among the most important of the 18th and early 19th centuries. This is all in addition to his work as novelist, playwright, and lyric poet.

Of course, Goethe's catholic interests and his creative life were never separated, and thus the student concerned with Goethe's writings must necessarily approach his works with the understanding that topics from a vast variety of disciplines will be addressed in their pages. Nowhere is this more the case than in *Faust*, the work to which he returned periodically over the course of sixty years. *Faust* is a work of extraordinary complexity, especially Part II, and no interpretation, however persuasive, would claim to be definitive. But much foolishness has been written about the play by scholars who have failed to realize the astonishing range of subject matters from which Goethe drew his symbols.

Take, for example, other literatures. I have already noted the Dante connection, which provides most of the structure for the end of the play. In addition, Goethe translates Shakespeare, alludes to Milton, and bases a character on Byron. He borrows material from Homer, Hesiod, Socrates, and Euripides, plays off of Ovid's *Metamorphoses*, cites Lucan and Seneca, and demonstrates his awareness of the Spanish and French writers of his own and other times. What is more important for our purposes, Goethe clearly expects his audience to recognize these citations, translations, and allusions. When, for example, Mephistopheles sings "Er lässt dich ein/ Als Mädchen ein/ Als Mädchen nicht zürucke ("He'll let you in/ A maiden in/ A maiden not away"), Goethe wishes the audience to recall Ophelia's mad song in Act IV of *Hamlet*. Not only is there a perverse irony in putting Ophelia's words into the mouth of a devil, but the allusion provides a horrifying foreshadowing of the madness of Gretchen that results from her yielding to Faust.

Other literature is, of course, the source that one would most expect a playwright to employ in his work. But Goethe also turns to science (both physical and biological), theology and biblical studies, magic and the origins of science, mythology, philosophy, intellectual and political history, psychology, economics and other subjects. Over and over again, details from these fields become part of the rich and dense text and enhance Goethe's concepts of creativity and destruction. In *Faust II*, for example, Wagner, Faust's former student, is in the process of producing a disembodied life-form. The laboratory is described as "medieval," and the project seems like alchemy of a very primitive sort. But the process that Wagner employs, heating carbon to ever higher temperatures with resulting flashes of light and the eventual production of a diamond, has its origins in Goethe's awareness of the contemporary work of Lavoisier, Scheele, and others who had demonstrated that diamonds were not a type of rock crystal, as had always been thought, but the final result of pressure and heat on carbon. This bit of scientific information, placed within a magical context, merges with many similar inclusions to help symbolize Goethe's organic view of nature and his concepts of change and metamorphosis.

Goethe's merging of magic and science is historically accurate, of course, and also matches the historical and literary sources of the Faust legend. In the play matters of magic become so complex that E. M. Butler's famous tracing of the sources requires three volumes. Goethe's magic scenes, however, differ from those in most literature not only in the fact that he knew the late medieval and renaissance sources so well (especially Paracelsus), but because he understood that this magic was not the hocus-pocus of cheap fantasy writing, but consisted rather of serious attempts at penetrating the secrets of whole cosmologies.

Because of Goethe's interest in contemporary science and the pantheistic aspects of his organic views of the cosmos, some commentators (Lieselotte Dieckmann, for example) argue that *Faust* presents a non- or perhaps anti-religious view of the world. Others, however, find the religious aspects of the work far more complex and enigmatic. But whatever interpretation one ultimately prefers, it is clear that the Bible and Christian theology have important roles in the play. Even in today's age of biblical ignorance, I would guess that most readers recognize the Job sources in the "Prologue in Heaven," but it is unlikely that many of the other biblical materials are noticed. I suspect even references to Saint Peter's keys or tongues of fire slip past many modern readers, and most of the biblical references are far more subtle than these. (My colleagues Randall Jones and Steven Sondrup have recently completed a computer concordance of the entire *Faust* material. They have clearly demonstrated that the play is almost saturated with materials from the Luther Bible. I suspect that most modern translators, having generally poor knowledge of the Bible themselves, miss most of these references. Even when they do recognize them, they put them into modern English rather than into King James English, the only language that might have the same cultural resonance as Luther's German.)

One of the most difficult of all the plot elements in *Faust II* is the treatment of the development of paper money in the scenes with the Emperor. Readers can easily get bogged down in this material or come to think that the issuing of paper money backed by the hidden gold in the Empire is simply a broad parody of some of Europe's economic systems. The parody is certainly there, but I believe that an accurate understanding of the money scenes could be possible only if the reader has been introduced rather thoroughly to the history of the development of capitalism. Dorothea Lohmeyer points out that Goethe has portrayed the medieval Holy Roman Empire, in which the emperor is set apart as the protector of spirituality and chivalry in a divine state (Gottesstaat), directly at that time when western civilization was shifting to a culture in which fulfillment of life came in material prosperity. This momentous shift, the fruits of which we still harvest, is often noted only in passing. Studies in economic history might well provide important keys to this entire section of the play.

(Before I draw more definite conclusions, I need more reading in economics, but it appears to me that Goethe is already warning about the dangers of modern acquisitiveness. As a little experiment, I called up every use of the word "Gold" in the work. In a surprising number of instances it was linked with such words as "Geiz" [avarice] or with theft or fraud. The contexts of these references make

Goethe's comments appear to be modern. He is not referring simply to the medieval deadly sin, but to the culture-threatening aspects of modern exonomic values.)

There are literally hundreds of other examples that might be mentioned--especially those relating to Goethe's astonishing mastery of even the most esoteric texts from classical mythology and those that illustrate how he integrates music theory and opera into the play. Those examples that I have noted are not more important than the others; they are meant to be typical. But given limitations of space and our purpose, these will have to do. What is important here is the range of disciplines that Goethe chose to integrate into his play, which becomes finally a cosmic drama. I hope to have shown that the only way to penetrate this work with depth is to approach it from an interdisciplinary perspective. This is the approach that is taken by the finest Goethe scholars--even those who claim to be working within the confines of one discipline. And such an interdisciplinary approach to depth is required by almost all of the best humanistic works in every medium.

At the beginning of Goethe's play, Faust bemoans the fact that he has studied philosophy, medicine, "and, unfortunately, also theology" and that he is no wiser than he was before. God, who has previously called Faust "my servant," does not protect him from further knowledge. Instead, He lets him go through an overwhelming series of encounters with all areas of learning and experience. As Alan Keele has pointed out, Goethe demands the same from his readers or viewers. To gain a profound understanding of this work, we must become as Faust--being driven to search for knowledge and wisdom wherever it is found.

A HUMANITY

Peyton Richter

Teacher: "I am your professor of Humanities."
Freshman: "What's a humanity?"

"A humanity is the very opposite of an inanity, a profanity or an insanity;

Whatever makes life dearer,
expression clearer,
feeling stronger,
pleasure longer,
insight brighter,
spirit lighter,
judgment keener,
taste cleaner--
that's a humanity.

A humanity can be an urbanity or even a vanity, but not an inhumanity.

That which makes a mind cirtical or a skill analytical can be a humanity.

A beautiful face, an exquisite lace, a rose sniffed by a sensitive nose can be
a humanity.

A lovely light, an interesting sight, a right, a song but not a slight or a wrong
can be a humanity.

A fine meal, a loving feel, a kitten's ear, a compassionate tear, a duty clear,
maybe even a foaming beer can be a humanity.

The ticking of a clock, the color of a rock, a lock of hair, a friendly grizzly
bear, but not a stare or a dare can be a humanity.

A humanity is where it's at; that's that. It's not what's clever; it's what's forever.

That's humanity."

Gloria K. Fiero

REDEFINING THE HUMANITIES FOR THE POST-MODERN ERA

"...unless Humanities is advanced as a legitimate discipline with a specific program of study, it will remain an academic step-child..."

In 1972 Fred Schroeder warned, "When the humanities approach to teaching gets hung up on definitions, counter-definitions, and panel discussions on redefinitions, the death knell will have rung on the life and the force of the humanities..." (Schroeder 37). It is, then, with some degree of trepidation that I venture to "redefine the humanities for the post-modern era." However, I would contend that "humanities" has never been defined as an independent discipline. And for good reason. No consensus of the word's signification has ever been achieved. A singular noun for some, a plural for others, "humanities" has been called a concept, an approach, an attitude of mind, a social good, a form of knowledge--the list is daunting! Indeed, "humanities" is subject to such a variety of definitions that it is no wonder our more traditional colleagues often have little idea of what we are trying to accomplish the classroom, and little regard for courses listed under the humanities rubric. If, for instance, "humanities" embraces a variety of disciplines, is it also itself a discipline that subscribes to a formal program of instruction? Most certainly so. In order to substantiate my case for humanities as an independent discipline, I should like--at the outset--to review in brief the history and use of this complex term.

According to the Oxford English Dictionary, the word "humanities" describes "learning or literature concerned with human culture: a term including the various branches of polite scholarship, as grammar, rhetoric, poetry, and especially the study of the ancient Latin and Greek classics" (*OED* V, 445). In Cicero's time, the word *humanitas* designated the study of ancient Latin and Greek, and more specifically, grammar, rhetoric, and poetry. In the Middle Ages, "humanities" identified secular learning as opposed to "divinity," a distinction that remained prevalent well into the seventeenth century, when Francis Bacon referred to the three branches of knowledge as Divine Philosophy, Natural Philosophy and Humane Philosophy of "Humanitie." During the Renaissance, *studia humanitatis* came to stand for "a clearly defined cycle of scholarly disciplines, namely grammar, rhetoric, history, poetry and moral philosophy, and the study of each of these subjects was understood to include the reading and interpretation of its standard ancient writers in Latin and, to a lesser extent, Greek" (Kristeller 10). It is this curriculum that inspired the eighteenth-century Latin poet Rodolphus Languis to open a "school of humanity" at Munster, which supplied "every species of elegant learning" (*OED* V, 445). Today, in most European schools of higher education, the association between humanities and classical literature remains constant. But an important historical development in the use of the term "humanities" took place in the late nineteenth century, when the Oxford professor Sir Frederick Pollock warned his law students against neglecting humanities; rather, he wished every one of them could enjoy in the original Homer, Virgil, Dante, Rabelais and Goethe. Clearly, Pollock was updating the traditional definition of *humanitas* to incorporate classics of a more modern variety--an auspicious move indeed.

The broadening of "humanities," however, brings to bear still another terminological confusion, that between "humanities" and "liberal arts." In *Webster's Third Unabridged Dictionary*, for instance, "humanities" is defined not in the Ciceronian sense of an exclusively literary education, nor in the Renaissance sense of *studia humanitatis,* but rather, as "the branches of learning regarded as having primarily a cultural character and usually including languages, literature, history, *mathematics* (italics mine) and philosophy." At least one of the traditional "sciences" appears in the Webster's list. The connection between humanities and liberal arts seems to have originated in the second century, when the Roman writer Aulus Gellius defined *humanitas* as education and training "in *bonas artes*" (Gellius II, 457). But from at least the sixth century, the "good" or "liberal arts" described a program of study consisting of the *trivium* (grammar, rhetoric and poetry), and the *quadrivium* (geometry, arithmetic, music and astronomy)--disciplines "befitting a free man," that is, concerned with culture and morality as distinct from servile, mechanical and technical occupations. Though in most twentieth-century colleges and universities, the humanities represent only one division of the liberal arts curriculum (the others usually include the arts, the natural sciences, and the social or behavioral sciences), the word "humanities" is still often used interchangeably with the term "liberal arts," rather than with the narrower, more linguistically oriented *trivium.*

Alas, as Socrates pointed out to his friend Meno, "I began by looking for one virtue, and have found a whole swarm of them." Nevertheless, in Socratic fashion, I would begin by distinguishing "humanities" from other areas of study. Fortunately, the direction is already established. *The American College Dictionary* lists, (along with the traditional definition of humanities as "the study of the Latin and Greek classics"), a second one: "the study of literature, philosophy, art, etc. as distinguished from the social and physical sciences" (588). the 1977 edition of *The Illustrated Heritage Dictionary and Information Book* defines humanities as "those branches of knowledge concerned with man (sic!) and his culture, as philosophy, literature, and the fine arts, as distinguished from the sciences" (641). Both definitions are explicitly "*trivium*-oriented," and both define humanities as a generic term that comprises a number of other disciplines. No dictionary I have examined describes humanities as a discipline in its own right. However, I should like to do just that.

Designated as a proper noun, "Humanities" may be defined as *the study of humankind in its creative and communicative dimensions*, that is, the study of human traditions and values as revealed in various forms of cultural expression. The object of this discipline is to foster cultural literacy though a critical appreciation of the creative and communicative evidence of any given society. Such a definition preserves the oldest concepts of *humanitas* as a preoccupation with human culture, and allows the discipline access to a wide range of resources in literature, philosophy, history (in its synoptic and literary dimensions), music, dance, architecture, and art (including the electronic arts, such as film). This definition also embraces the changing character of creative and communicative expression. Even as we debate the merits of giving primacy in the classroom to the high-culture Western "classics," (a polemic recently revived by Allan Bloom and E.D. Hirsch), we need to assess the significance of low-culture forms of expression. In defining Humanities as the study of human traditions and values as revealed in various forms of cultural expression, we may revise the elitist, sexist and Eurocentric connotations of the term *humanitas* (especially its traditional designations as "elegant learning," and "mental cultivation befitting a man" (*OED* V, 445). This by no means implies a renunciation of the "classics," but it demands--as Sir Frederick Pollock acknowledged--enlightened consideration of the changing character of cultural expression.

Having defined "Humanities" as the study of hamankind in its creative and communicative dimensions, we may inquire after its pedagogical imperatives. What methods shall we employ in its instruction? As a discipline, Humanities must assume a regulating order--the very definition of the word "discipline." Any viable pedagogy for teaching Humanities in the postmodern era must, I think, take into consideration certain major problems. I outline five as follows:

1) the enormous mass of information at our disposal: we are inundated by a vast sea of cultural materials--both the collective flotsam of the past and the bewildering jetsam of the present;

2) the trend toward increasing specialization, the division of knowledge into discrete categories (Weaver 19), the narrowing of interests, and the emphasis on esoteric topics and terminology in education in general (Cheney 8-10)--a trend that one might interpret as a response to the first problem;

3) the general ignorance of non-Western traditions among students living in a global community;

4) the profound influence of electronic media, including and especially television, the image-specificity of which may contribute to the difficulty many students confront in understanding written

forms of communication--the NEH biennial report, "Humanities in America" notes that compared to the 12,500 hours the high school graduate spends in the class-room, he or she will have clocked almost 20,0000 hours watching TV (Cheney 17);

5) the shockingly low level of literacy among college and university students--a condition consequent perhaps to problem #4, and one so widely-publicized that I need not bore you with statistics . . .

These then, in my view, are the five major problems confronting Humanities education (and perhaps all education) today. Surely, even the most imaginative and well-funded educational reforms might fail to resolve *all* of them. Yet post-modern humanists must confront them. Indeed, any attempt to redefine the humanities for the post-modern era and any projection for a pedagogy in Humanities as I have defined the discipline must address these issues. Given the constraints of space, I shall outline but four proposed solutions. I would like to focus my attention on the reconstruction of the general survey course or courses in Humanities, those usually taught by one or a team of instructors, along with one of the currently available Humanities textbooks.* Here are my suggestions for teaching Humanities on the introductory level:

1) We should abandon the encyclopedic (or cafeterial) approach, that is, the approach that sets out to cover--in a single course or two--most of the great works of literature, art, music and philosophy. The cafeteria format dominates today's Humanities textbooks. It is characterized by the "another-famous-Renaissance-artist-was" style. Following traditional chronology, the cafeteria format lines up materials into disciplinary divisions--literature, art, music, etc.--throws dozens of great names and works of art at the student, and then examines their common traits or interrelationships. The cafeteria format produces little other than intellectual indigestion. To reject this approach, however, does not necessarily require gutting "the canon" or abandoning periodization. It is possible to retain the chronological thread, while weaving carefully selected materials around topical themes, concepts or ideas. For each historical period, an organizing principle might provide the matrix for an understanding and appreciation of primary sources. So, for example, "The Individual and the Athenian Community," might serve as the organizing topic in which the student reads Sophocles' *Antigone*, parts of Aristotle's *Politics* and Plato's *Apology*; Renaissance artists might be introduced as "Disciples of Nature and Masters of Invention," that is, as artist/scientists--a phenomenon readily accessible to contemporary students; the Scientific Revolution with its emphasis on empiricism and objectivity might be linked to developments in seventeenth-century Dutch painting and the rise of instrumental (or absolute) music. Basically, what I am advocating here is not radically different from Joseph Satin's insightful proposal (launched two decades ago) to place "contem-

poraneous examples of works from different areas side by side to find their common elements" (SatinI,4). In place of Satin's theoretical model, which establishes "traits," "forms," ets., I prefer a topical focus that sets particulars in a meaningful (dare I say "relevant"?) context. Above all, however, in Humanities survey courses, selectivity should be practiced ruthlessly. For it is not the goal of Humanities to teach the entire his-tory of culture, but rather, to bring to life selected aspects of the humanistic tradition. Ideally, the content of Humanities should become part of the student's own humanity.

2) As a discipline, Humanities education should seek to develop its own discourse. Humanities surveys need not be mosaics made up of a little bit of art history, music history, literary analysis, etc. Rather, armed with what humanist Paul G. Ruggiers calls "the best that has been thought or said or demonstrated about human life" (104), Humanities instructors should mediate between text and context. Indeed, Humanities discourse might proceed from that very initiative. All manifestations of human culture--from a Bach cantata to baseball--are "texts" that carry cultural significance and require meaningful contexts. As a discipline, Humanities explores the best texts in their contextual and creative dimensions, revealing what the texts signify about the time in which they were created, and imparting some appreciation of their inherent and lasting value. If Humanities aims at inculcating cultural literacy, it also peddles enlightenment and delight; it deserves a discourse that self-consciously eschews narrow specialization and esoteric terminology, a discourse unique to the discipline called "Humanities."

3) We should abandon the exclusively Western bias of Humanities education, and provide students with some understanding of the traditions and values held by the peoples of Africa, the Near East, China and India (at the very least). Since the post-modern era unfolds in a "globally interdependent world" (DiBaggio 3), Humanities instruction should seek to enhance the student's understanding of non-European cultures. It is indeed a sad indictment of American education that although Moslems constitute approximately one-third of the world's people, and Moslem fundamentalism affects the course of current world affairs, most of our students are taught little to nothing of Islam in Humanities classrooms. (Of the six Humanities texts listed below, only two include any non-Western materials.)

4) Primary sources must remain the fundamental resources for Humanities education. Humanities students should read primary sources in the best possible translations, complete with explanatory footnotes. Original works of literature and art, and live performances of music, dance and drama lie at the heart of Humanities instruction; live performances and original sources lacking, the best of audio-visual materials should be used.

1201

The four suggestions I outline here for determining the pedagogy of Humanities survey courses address mainly the first three problems I originally cited: proliferation of cultural data, increasing specialization, and Eurocentricity. As to the influence of electronic technology and its inherent image-specificity, I suspect that Humanities, a discipline that deals with a variety of non-verbal forms of expression, may be able to make educational inroads where traditional disciplines are failing. I should like to see, for instance, Humanities courses (armed with films and slides) introduced on the grade and high school levels--an initiative already begun in some parts of this country. And as to low literacy levels, I venture only one solution: denying graduation from high school to any senior who can not pass a standard literacy test.

Utopian reforms aside, however, it is certain that unless Humanities is advanced as a legitimate discipline with a specific program of study, it will remain an academic step-child of post-modern education. In a nation where, according to the most recent NEH statistics, only 53% of American colleges and universities require undergraduates to take a course in history, only 65% require courses in American or English literature, and only 38% require a single philosophy course for a bachelor of arts degree (Cheney 5), a one year Humanities survey would seem essential, not as an indulgence in "elegant learning," but as an invaluable means of cultivating in all students a critical and global appreciation of the humanistic tradition, and a deeper insight into their own precious humanity. Indeed, Humanities--as an independent discipline--must become the keystone in the arch of liberal education.

HUMANITIES EDUCATION CONNECTIONS

Ideas and materials for better teaching and learning in the humanities.

Susan L. Feagin
Burton L. Dunbar

INTEGRATED STUDIES IN THE HUMANITIES: AN EXPERIMENT IN INTERDISCIPLINARY TEACHING

In the past ten to fifteen years, faculty members of humanities departments at liberal arts colleges and universities have lived through major individual and professional disappointments. Virtually every one of us has stories of personal misfortune that footnote the facts set forward so neatly in the 1980 Rockefeller report on the humanities. There have been downward markets for college-level teachers in our fields, frozen positions, dismissed junior colleagues, strains of the nomadic life style of one-year teachers, and an overall decline in financial support for research. The stimulation we lacked from colleagues was not compensated for by students. There are fewer undergraduate majors, smaller enrollments in elective classes, and decreasing numbers of applicants for admission to graduate work.Though the importance of an education in the liberal arts, and even of a humanities major, are more widely touted today, the humanities can hardly be termed a "growth industry." We have become adjusted to having fewer faculty colleagues, very little "new blood," and numbers of career-oriented students uninterested in the humanities. A residue of problems which began in the late 1970s persists.

As if to add insult to injury, beginning in 1984 several studies appeared with strong indictments against the quality of higher education in America; one of the most potent was William Bennett's 1984 NEH report, *To Reclaim a Legacy*. Many colleges and universities responded by trying to establish a "core curriculum" in the humanities which teaches major developments in the history and culture of our civilization. And today we see institutions scrambling to assess the value of the education they deliver, and to ensure that students meet minimum standards of competency in writing, critical thinking, and the specialized subject area of their major.

Many institutions, however, did not wait for public indictments to begin thinking innovatively about how to make the humanities more meaningful and more accessible to college undergraduates. At the University of Missouri-Kansas City (UMKC), our immediate concern to solve the problems of declining enrollments during the late 1970s led eventually to painful discussions about possible short-comings endemic within the teaching of the humanities in general. From our current vantage point, three factors can be identified as having intensified our inadequacies as teachers and depleted the intellectual and professional support faculty could provide each other. These factors were over-specialization of course offerings, isolation of departments, and a lack of coordination among courses in the undergraduate curriculum.

With the assistance of two grants from the National Endowment for the Humanities, faculty at UMKC developed a set of interdisciplinary courses in the humanities, where contrasting and coordinating perspectives of teachers in different areas of specialization were compared within the context of a single course. Because of the way the structure of the program was designed, working on these courses revitalized faculty interest in broader issues of how their own subjects relate to other aspects of the humanities and social sciences, and they have provided students with a singular educational opportunity. In the pages that follow, we will describe the three factors which we see as having contributed to a downturn in the effectiveness of humanities teaching, the structure of the program we instituted, and how specific features of it have ensured that its benefits will continue to be felt. Though our own program was developed on a fairly large scale, the principles can be used in developing even a single course, and hence are broadly applicable to situations where faculty recognize difficulties in their own classrooms.

I. THE CHALLENGES

1. *Over-Specialization of the Curriculum.* The increasing specialization of faculty and of departmental undergraduate curricula alienated many students pursuing other areas of study. The result was that they were disinclined to take courses beyond the introductory level outside their own major. In our enthusiasm to prepare our own undergraduate majors superbly for graduate work (in the most extreme cases, by making them little carbon copies of ourselves), we designed specialized courses and a system of prerequisites that allowed little enticement to majors in other fields even within the humanities, much less to someone from pre-professional programs or professional schools. The irony of this situation was that we humanists were guilty of the narrowness we so vehemently accused the professions of building into their curricula. A person is too "career-oriented" if interested only in medicine, but somehow it's not as bad if the student is interested in nothing but the history of France from 1789 to 1870. (As one professor delights in putting it,

"Everyone is welcome in my Northern Renaissance art history course - as long as your Flemish is good enough!") Specialization is a necessary part of academic life, but not to the exclusion of a broad acquaintance with other fields as well.

2. *The Isolation of Academic Departments.* The departmental structure with which we feel so secure was inadvertently contributing to the narrowness and fragmentation of our curriculum. Departments do not always group together colleagues who could benefit from working with one another (for example, the art historian and the aesthetician). We found, moreover, that departmental authority was insurmountable for any faculty member who tried to share a classroom with a colleague in another unit in anything more structured than a random exchange of lectures. There was first the practical concern of how departments would compute teaching loads and enrollments in team-taught courses. A much more fundamental problem was the position held by many faculty that interdisciplinary courses were invariably superficial and diluted in content, and that because a student did not study only literature, or history, or philosophy, or whatever, within a given course, it should not count toward the major in any subject. We never denied the appropriateness of the departmental structure as a logical administrative arrangement for dealing with the array of personal and curricular issues which so profoundly affect student academic life and faculty's professional fate. At the same time, however, we felt that unbridled departmental hegemony contributed to an atomistic curriculum. The task was to address this problem without altering the department as the fundamental unit of advocacy for each field of study.

3. *A "Cafeteria-Style" Baccalaureate Curriculum.* Too little attention to forging connections between disciplines had been made in the design of the curriculum. This situation was not entirely the by-product of over-specialized faculty working in rather insular departments, although these factors clearly contributed to this end result. We had never created any formal classroom provisions to draw students' attention either to the connections between facts and theories of different disciplines, or to the fundamental differences among the methodologies of various specialties, even when they address the same general subject area. As a result, students selecting coursework did resemble the cafeteria customer who picks and chooses from different categories without much concern for their overall interaction. Even among our majors, a student's exposure to any field consisted of courses which were encapsulated units, unrelated to complementary information and methodologies, rarely addressing broader issues which reflect the values of the humanities in general.

II. MEETING THE CHALLENGE: AN INTERDISCIPLINARY CURRICULUM

At the heart of our project was the assumption that we should emphasize those aspects of the humanities which bring our fields of study together. We proposed developing a set of interdisciplinary courses, where faculty from

1207

different departments would work together to create the courses, as a way of addressing all three of the problems just discussed: narrow teaching and research interests, departmental isolation, and intellectually uncoordinated curriculum requirements. But proposing interdisciplinary courses as a solution to these problems ensured that they themselves had to be virtual paradoxes. They should involve several disciplines, yet be fully controlled by each department; they should permit the development of new courses, but also stand as part of the regular curriculum of each department; they should be broad enough to be accessible to non-majors, yet specific enough to meet the needs of students in the field; they should meet service obligations of the departments toward liberal arts education, but not diminish a department's ability to offer a full undergraduate curriculum in each humanities field; and, finally, they should provide a new teaching experience for faculty and stimulate new research ideas, while not requiring unreasonable time commitments. Clearly, these requirements for developing interdisciplinary courses at UMKC seemed like compelling reasons not to try to create them at all.

There was one interdisciplinary course model, however, which in fact meets these conflicting requirements. It is known as the "cluster course." The model was developed at Clark University, Worcester, Massachusetts, and on the campuses of a number of other schools, all primarily liberal arts, privately supported institutions on the eastern seaboard, each with homogenous students bodies and highly select student admission standards. Faculty from our campus first learned of the Clark program at a workshop report delivered by Professor Marvin D'Lugo from Clark at a 1978 meeting on "Critical Issues in the Humanities," sponsored by the American Association of Colleges. The challenge at UMKC was to adapt the Clark University program to the heterogeneous student body typical of our public, urban university.

In this model, every interdisciplinary cluster consists of two to four separate courses. Each course is offered by a different department, but all courses within a cluster focus on a common theme or historical period. Each of the courses within a given cluster is taught by a faculty member from a different department from the perspective of his or her own discipline. All of the courses within a cluster are scheduled for the same time on the same days of the week, and at least one of the scheduled rooms is large enough to accommodate the students of all component courses of the cluster. All courses within a cluster meet together for at least one third of the sessions in order to ensure a fruitful cross-fertilization of ideas, but the exact number and timing of the common sessions are determined by participant faculty within each cluster. Faculty plan their own courses in tandem with the others, so that ways in which the different disciplines supplement and contrast with each other can be explored.

This model has several advantages over the way interdisciplinary courses are usually taught. First, each faculty member teaches a separate course which is approved by and offered within his or her department, just like any other departmental course. This arrangement solves the problem of how to compute teaching loads and student credit hours for interdisciplinary work. Second, each student enrolls for a course within a given department, a course which counts towards the major in that department or towards area or distribution requirements, again like any other departmental course. These aspects of the model accommodate practical concerns of how, institutionally, a team-taught course fits into the departmental structure. Third, by working together to decide on course content, faculty help each other grow out of the narrow and specialized teaching in which many of us have become entrenched. When we are required to assimilate material from other disciplines into the context of a course, we are forced to reexamine the ways in which our own disciplines relate to other fields of scholarship and to the humanities in general. The difficulties many of us have in communicating with colleagues in other departments give new insight into how difficult it must be for uninitiated *students* to appreciate what we are trying to do. Fourth, establishing substantive contact between faculty with common intellectual interests helps expand research interests as well. To cite one example from our own program: a sociologist's study of public spaces gave an art historian a new perspective on the history of architecture. Furthermore, clusters allow for evolution and growth, by replacing or expanding on the number of participant faculty. This flexibility is essential for any program designed to avoid the intellectual stagnation brought on by uncertain enrollments and infrequent appointments of new faculty. It allows the intellect and scholarship of existing faculty to be utilized more effectively. And, of course, there is no reason why this model must be confined only to the humanities. Our own clusters have courses combining the humanities with classes in the social sciences and the sciences.

III. THE INTEGRATED STUDIES IN THE HUMANITIES PROGRAM

The cluster course model, appealing in its simplicity and utility, seemed to be exactly the mechanism we were looking for to address the three major concerns we had identified with the humanities teaching at UMKC. A carefully planned curriculum of interdisciplinary clusters would indeed offer non-majors the opportunity to enroll in courses which were more broadly conceived, and planned around less specialized topics. The courses were completely compatible with our strong departmental structure, yet they would permit faculty with shared interests in different disciplines to work together; this opportunity for faculty would expand and enrich their research interests as well as revitalize their enthusiasm for teaching.

To accomplish these ends, however, we needed to provide faculty with time to develop new courses, to travel to learn about similar programs at other schools, to add to our library, to provide clerical assistance to the faculty, to underwrite new instructional material used in the classroom, to evalute the program effectively, and to provide for its careful administration. The resources to meet these needs were provided for by two major grants awarded to the university

1209

by the National Endowment for the Humanities between 1979 and 1985. In accepting NEH awards of $304,000 the University also agreed to commit more than $600,000 in cost-shared funds to the project.

In order to encourage as many non-majors as possible to enroll in our cluster course offerings, we agreed that there should be no prerequisites for any of them. It seemed incongruous, on the one hand, to create more than a score of new courses in more than a dozen clusters, all designed to attract students back to the humanities, and then, on the other hand, to repel them by making their participation in the courses dependent upon previous work. The positive effect of this decision was that students were encouraged to consider cluster work without prerequisites as an alternative to introductory courses. For the faculty, the fact that they could not assume familiarity with the approach of their discipline on the part of students, and sometimes not even on the part of faculty with whom they were teaching, made them reexamine many of their intellectual assumptions.

The experimental nature of the Integrated Studies program made regular evaluations of the clusters a virtual necessity. NEH funding provided an outside evaluator to visit campus for each new cluster in order to attend class sessions, meet privately with students, and talk with faculty about the course and the program as a whole. Three in-class student evaluations were taken in each class: one at the beginning of the course recording students' backgrounds and their expectations for the course, one at mid-term to identify special problems students might be having with the material, and a final evaluation to measure whether things eventually "came together" by the end of the course. As a whole, students were excited by the widened perspective and different points of view provided by cluster courses. The following comment is typical, "I find I learn something better when I can relate it to other fields of study." Though the abundance of viewpoints was confusing to some, most saw it as challenging and stimulating. As a testimony to student enthusiasm for the courses, approximately 80% of all students enrolling in ISH project classes asserted that they would elect cluster courses instead of "normal" courses. On the downside, students disliked not having enough discussion time, especially with guest lecturers. There seems to be a tendency on the part of many faculty, especially the first time a cluster is offered, to underestimate the amount of time a student needs to assimilate the information provided. Finally, the faculty members themselves were asked to provide assessments of their own courses. Faculty reactions were overwhelmingly positive. The constant recurrence of the claim that working closely with top faculty from other fields has led them to see their own field from a new perspective has made it almost cliche. It is clear that they broadened faculty's perspective on what they do, by forcing them to state the nature and value of their fields, and by understanding the relevance of other fields to their own. Furthermore, observing the pedagogical techniques of others refreshed their own teaching methods, and often new research ideas emerged from the contact.

The Integrated Studies in the Humanities project never attempted to superimpose any hierarchy of material which had to be covered, nor did we create a uniform policy on even the mechanical issues of exams, papers, number of common sessions, or the like. Our method of administration was to select faculty whom we knew were excellent teachers and conscientious researchers who would be interested in an experiment in interdisciplinary teaching, and then leave them alone. We trusted their good sense and their years of experience in these matters, allowing instructors in each cluster to reach their own agreements on these issues and to accommodate each other's teaching styles. As a result, the project has taken on an immense variety and richness textured by the talented individuals who teach in it, evolving in a manner which made cluster courses distinctly different from others in the curriculum, including those with interdisciplinary content.

Unlike many interdisciplinary programs today, ours is not designed to offer a core curriculum in the classics of Western civilization. Our objective is not to give an understanding of our cultural heritage, but to show how a single discipline provides only a partial understanding of any given topic. The merging of minds trained in different ways enriches and stimulates student minds by making them aware of how much more complicated knowledge and the world our knowledge attempts to reflect, really is. Cluster courses are anything but watered-down, warmed-over offerings of usual course material. They are not easy to teach and not easy to take. The Integrated Studies in the Humanities project never offered interdisciplinary work which was "intellectually soft," as was feared by somewhat more conservative faculty.

IV. AFTER THE SMOKE CLEARS

In six years we expended nearly $1 million in combined NEH and university funds and countless hours of faculty work time. Did the project have an effect on humanities teaching and research on our campus which could be of significance to other schools as well?

Three important facts illustrated the importance of the cluster course project, as a permanent addition to the College of Arts and Sciences. First, almost all of the courses we created become part of the curricula of their relevant departments and are offered as part of a cluster on a regular rotational basis in their units. Second, the faculty of the College eventually agreed that cluster courses should be included in the distribution requirements for the baccalaureate degree: all students in the College are now required to complete at least one cluster course in the humanities as a requirement for graduation. One sign that artificial academic boundaries have been partly broken down is the fact that, for the purposes of this requirement, history counts as one of the humanities (in line with its acceptance as such by NEH), even though it is in the social sciences division at UMKC. Finally, the university agreed to continue the administration of the project by establishing an office for its director, with clerical support and a budget, after NEH funding ended. That office has been in operation for two years now, and new clusters involving nine courses have been taught or added to the curriculum during that time. Humanities departments have also added an experimental cluster number to their curricula, so that new courses can be tried before making a commitment to provide them as regular offerings. An average of four clusters are taught each semester, and one during the summer, to enable students to fulfill the cluster requirement.

Beyond these tangible effects, the entire experience of the Integrated Studies in the Humanities program at UMKC created a ripple effect of benefits emanating out of the courses themselves. Quite obviously, six years of creating new courses enriched the curriculum significantly. At the same time, cluster courses reinforced the importance of interdisciplinary work in the liberal arts, supporting other interdisciplinary programs in Women's Studies, American Culture, and the Classics. They functioned, moreover, as catalysts to bring faculty together to examine new issues and to work with new colleagues outside their own departments. The importance of the program for its faculty development benefits is the single aspect of the project most often referred to by the faculty themselves. Overall, the quality of the courses, their intensely scrutinized evaluations by outside consultants, the high opinion of the project by students, and the visibility of the cluster course core faculty functioned as well to keep the humanities in the forefront of the campus.

Outside our campus, the project and its continuation teach some general lessons about interdisciplinary curricular planning. First, the cluster course model, by the mechanics of intersecting a number of independent courses through common sessions periodically throughout the semester, is an uncomplicated, workable solution to administrative problems which often accompany interdisciplinary courses. The model allows deans, departmental chairpersons, faculty members, and students to count courses as their "own" in the arithmetical stakes of computing faculty teaching loads, student credit hours, and work toward requirements. Furthermore, the model does not have to be applied only in the context of a major program. Two or three interested faculty from different departments could get together to teach a cluster themselves, requiring only that they be scheduled to teach a course at the same time on the same days. These less-than-glamorous considerations are important aspects of real academic life which cannot be ignored in curricular planning.

In addition, this model helps to keep our thinking focused on the very process of humanistic discovery. The model requires focusing on a single topic and then moving around this subject by approaching it from different vantage points. We are able to show our students that there are indeed common points of reference in the humanities as we look at any problem, regardless of our individual specialties. But we are also able to show them that there are considerable differences among our fields of inquiry, not only in the methods we employ, but in the conclusions we reach. In fact, some of our most successful clusters were ones in which professors and students engaged in a semester-long attempt to understand the differences that existed between their fields and, consequently, their divergent approaches to the same body of information. They were clearly as interested in the process of identifying these differences and discussing them as they were in presenting the core facts of the discipline. Encouraging faculty to think long and carefully about what they do that is similar to or different from what their colleagues in allied humanities subjects do provides a keen sense of the worth of their own fields as well as a new familiarity with and appreciation of the fields of others.

Defining and defending the humanities are complex and open-ended tasks. The disparity between different disciplines within the humanities provides a richness which is essential to them, and the multiple relationships between those parts are the loci of their value. No academic discipline has meaning, or even an identity, in isolation, but only as it integrates and relates to other intellectual and practical pursuits. Though many of us in our own research rewardingly pursue esoterica as ends in themselves, we have to remember that in *teaching* we cannot expect these passions to be echoed by our students. The significance of specialized research is manifest in its relationships to other specialized work as well as "common knowledge." Seeing these relationships is exciting, and we are shortchanging our students if we do not exhibit these connections. If we do not, the humanities themselves will pay the price with a diminished role within academic institutions and eventually, in society.

APPENDIX A: CLUSTERS OFFERED AT UMKC 1979-1989

A one-year pilot grant for 1979-80 funded the development and teaching of three experimental clusters. Nine faculty from four different departments were involved. Each of these three clusters focused on a particular historical period: "Kingship in the Middle Ages" (English, history, and philosophy), "Images of the Human Body in the Renaissance" (art history, English, and history), and "Radical Changes Since 1945" (art history, English, and history). The success of these courses led to a four-year implementation grant from NEH for 1981-1985. This grant funded the addition of eleven more clusters to the program. Two centered around historical periods ("The Roman Revolution" and "The Romantic Hero") and were designed to complement the original three clusters of the pilot year. The remaining nine focused on themes other than historical periods. (Peoples and Communities in Western Civilization; Continuity and Change in the American City; Ethical and Social History of American Capitalism; Aesthetic Issues in the Arts; Women's Lives: An Exploration through Literature, Psychology, and Sociology; Controversy and Choice in Life and Science; Dimensions of the Holocaust: Literary, Historical, and Religious; Issues in Death and Dying; Barriers and Bridges: Understanding Communication. Some of these themes were chosen because they coincided with the major missions of the university (health sciences, the fine and performing arts, and urban affairs), and others simply because they represented special interests of faculty and students. Two other clusters (The Story of Language; The Silver Screen and the American Dream: The American Social Film) were developed without NEH support. A total of sixteen clusters were added to the college curriculum during the grant periods. In all, forty-three faculty members were involved in teaching these sixteen clusters, representing twelve separate departments as well as the School of Medicine and the Conservatory of Music. In addition, another seven faculty members from the Schools of Dentistry, Medicine, Nursing, and Pharmacy were substantively involved in a cluster focusing on the health sciences.

Some of the new clusters we have prepared since the expiration of the grant include "Bridges" (Engineering, History), "Sight and Sound: An Examination of Perceptual Experience" (Art, Philosophy, Psychology), "Clio and the Other Muses: History and Culture in Fifth Century Athens (English, History), "Sinai and Olympus" (English, History), and "Russia at the Millennium" (Conservatory of Music, History). Other clusters in the planning stages include "Law and Society Through Film" (Business and Public Administration, English), "Central America: The Human Condition" (Foreign Languages, Economics, History), and "Popular Culture and the Missouri Archives" (Communication Studies, and the Director of the UMKC Library).

Several other schools that were funded by NEH to develop curriculum projects using some variation of interdisciplinary clusters include the earlier programs at Clark University and Holy Cross, Worcester, as well as programs at the University of Delaware, Gustavus Adolphus College, Syracuse University, Evergreen State College, Western Kentucky University, the University of Colorado-Denver, the University of Minnesota-Minneapolis, and Utah State University.

APPENDIX B: SUGGESTED READING ON ISSUES OF REFORM

In the report of the Rockefeller Commission of the Humanities, *The Humanities in American Life*, Berkeley, 1980, see especially pp. 85-87, 163-64. An earlier Rockefeller Foundation report was prompted by the employment decline for college-level humanities teachers: *The Useful Humanities: Alternative Careers for PhDs in the Humanities*, New York, 1979. In a national-wide survey, Cecilia Ottinger of the American Council of Education discovered that bachelor's degrees in the humanities dropped from 312,538 in 1972-73 to 91,351 in 1982-83. During the same years, computer science degrees increased from 4,304 to 24,506; health professions, from 33,564 to 64,616; and business and management degrees, from 126,830 to 226,892 (see American Council on Education, *Higher Education and National Affairs newsletter*, 34, no. 20, October 28, 1985, p. 3).

William Bennett's much publicized *To Reclaim a Legacy* was reprinted in the *Chronicle of Higher Education*, 29, November 28, 1984, pp. 16-21. For various opinions about the report, see, among others, J.Z. Smith, "Commentary on William Bennett's *To Reclaim a Legacy*," *American Journal of Education*, 93, August, 1985, pp. 541-46 and N. Birnbaum, "A Misguided Call to Spiritual Renewal," *Chronicle of Higher Education*, 29, January 9, 1985, p. 128. Among the other reviews of higher education with suggestions for curricular reform are NIE's *Involvement in Learning*, 1984; AAC's *Integrity in the College Curriculum*, 1985; AASU's *To Secure the Blessings of Liberty*, 1986; and the Carnegie Foundation for the Advancement of Teaching report, *College: The Undergraduate Experience in America*, 1986. Our discussions were helped in the early stage by Joseph Duffey's "The Future of the Humanities: A Move Away from Professionalism," *Liberal Education*, May, 1978, pp. 182-89. The Association of American College's report on the *Integrity of the College Curriculum* recently reiterates the importance of approaching the undergraduate curriculum as a whole, in addition to specific recommendations for experiences in basic areas of study. Reprinted in the *Chronicle of Higher Education*, February 13, 1985, pp. 12ff.

In the vast literature about interdisciplinary approaches to teaching, we found the following works especially helpful: "Report on Teaching; Interdisciplinary Studies," *Change Magazine*, December, 1978, especially articles by Earl J.

McGrath, Peninan Glazier, and Ronald A. Carson; Donald A. McAndrew, "Measuring Growth in an Interdisciplinary Humanities Course," *English Journal*, 69, no. 2, February, 1980, pp. 52-56; Mickey Friedman, "Reconciling the Two Cultures," *American Education*, 16, no. 2, March, 1980, pp. 25-29; Robert J. Frankle and David R. Hiley, "Course-Pairs: Team-Teaching without Tears," *Liberal Education*, 66, 1980, pp. 340-346. The faculty development benefits of interdisciplinary work are stressed in the following: Eugene Goodheart, "Faculty Development," *ADE Bulletin*, 56, February 1978, pp. 13-16; L. Brillhart and M.B. Debs, "Team Teaching and Faculty Development: A Simultaneous Process," *Educational Research and Methods*, 12, no. 1, 1979, pp. 18-20 and Alvin M. White, "Developing and Challenging Faculty through Interdisciplinary Teaching-Learning," in *Effective Approaches to Faculty Development*, Washington, D.C., 1980.

UP, DOWN AND ACROSS: A WRITING CAMP MODEL FOR INTERGENERATIONAL, INTERDISCIPLINARY INTERACTION

The term *interdisciplinary* commonly refers to the blurring of traditional disciplinary boundaries in an academic setting. The reasons for this can be idealistic, originating in a belief that learning should not be rigidly segregated, or practical, driven by concerns for student head count and professional resources. When these two purposes combine in a project, the results can often be gratifying despite apparent cross-purposes. Such was the case with a model developed at Wichita State University. A simple idea--hosting a writing camp for high school students--grew out of a desire for a flexible model that would provide direct and indirect benefits to those involved, and serve as a model for university teachers and students in other disciplines interested in pursuing not only interdisciplinary but also intergenerational learning projects.

For five years, Wichita State has sponsored a Summer Writing Camp for adult and young writers. The camp is a week-long opportunity to work together in an intergenerational, interdisciplinary workshop. Camp participants work with consultants, search out subjects to write about on field trips, participate in writing workshops, and edit and revise their writing in small groups. While the camp emphasizes writing, the model could be used in other disciplines in the humanities, sciences, or creative arts. In other words, any project that involves teachers or other professionals working with small groups of students could benefit from this model. The model grew out of the activities of the Kansas Writing Project, a site of the National Writing Project network. An essential element in the success of the National Writing Project has been the insistence that the best teacher of writing is a teacher who writes. Over the past decade, this basic philosophy has been applied in NWP Summer Institutes where teachers review theory and practice of composition and rhetoric, develop models of successful classroom practices to present to other teachers in workshops, and work together in small groups on their own writing in an attempt to understand and apply composition theory to their own classrooms and their own writing

1219

processes. Teachers involved in the Kansas Writing Project did all of these things.

Still, as director of the Kansas Writing Project, I felt that something was missing. If we wanted this understanding of writing to filter through all of these layers--the theoretical readings, the intensive summer institutes, the inservice workshops, and finally to the student writers themselves--wouldn't it be wise to work directly with some of them? We began to plan a project designed to accomplish several things. In addition to the focus on students and teachers as writers, we wanted the teachers--both secondary and college-- to work with students in an informal setting. We wanted the participants to realize that writing can take many forms. We wanted them to recognize that writing comes from the variety of experiences outside the formal classroom, and from their own powers of observation. From the first year, the model has met our expectations. As one teacher commented after the first camp, "I had been hearing about the writing process...'How does all this work?' I asked myself a hundred times.' Can you really get these kids to do this?...Will I change the way I teach writing in my class next term? You bet I will!"

The informality of a summer camp was especially appealing, particularly after we had some success at Wichita State with spring seminars on writing where high school teachers and students worked with consultants from various disciplines. From the beginning, the focus was on writing *about* something, not on trying out particular teaching methods or rhetorical forms. What was missing was the opportunity to follow a piece of writing through to completion. Writing rarely flowers in a few short hours, and the usual problems of articulation between high school teachers and college faculty made formal classroom follow-up difficult. Furthermore, simply watching a consultant work with the students had not given the teachers much training in working with student writers. There was not enough time to build confidence and establish routine that a good learning climate requires.

Clearly, what was needed was something more ambitious that would adhere to the National Writing Project philosophy that the simplest model is best. Research by Donald Murray, Donald Graves, Nancy Atwell and others has shown that good writing teachers write with their students. Research has also shown that surrendering enough authority to allow the students the freedom to develop their innate styles and voices in independent groups is often an overwhelming challenge if not a threat to a teacher. But what would happen if good writing teachers worked intensively with young writers who were not their students? If they were merely adults and young writers, would there be more interaction, more encouragement? If adults and young writers could come together as writers for an entire week, perhaps they might rediscover something they knew when they were kids: writing is work, but it can also be fun, especially when it is shared with another writer.

With these philosophical assumptions as our base, we set out to develop a workable model. In 1984, twenty-two students joined seventeen teachers who were participating in the KWP Summer

1220

Institute for a week on the Wichita State University campus. Dan Kirby, author of *Inside/Out* and other writing texts, joined us on the first day to provide some theoretical and practical expertise for the adults and young writers. For the remainder of the week, participants were divided into writing groups that included a balance of adults and young writers. In a rotating series of workshops, each group participated in exercises and activities based on Kirby's initial presentation and on ideas the teachers had developed in the preceding weeks of the Summer Institute. The next year eighteen students joined five teacher/consultants from past KWP Summer Institutes and five graduate students from the MFA program in creative writing at WSU. Peter Stillman, author of *Writing Your Way* and an associate editor for Boynton/Cook publishers provided the initial impetus on the first day. He had the writers engage in activities that became poems, journalistic interviews and personal sketches. We introduced a field trip off campus. On the second day of the camp, we went to the local "living history museum," Cowtown, to use our powers of observation through the use of field notes, an idea adapted from Stillman's book. From this experience came simple descriptions, short stories, more poems, and careful word sketches. On Wednesday and Thursday, the creative writing students led workshops on poetry and fiction. On Friday, after final editing and proofreading in writing groups, the camp ended with a read-around: everyone who wanted to participated.

From the first, we have emphasized sharing and collaboration. For this reason, we do not rate students' writing or award prizes. Rather, we try to maintain a climate of support. A younger writer might give an adult just the idea needed for a start or a revision. We want the sharing to go beyond writing groups and the final read-around. Each year, all participants submit at least one piece of writing to the publications editor, and a camp publication is mailed in early fall.

This basic model has persisted in subsequent years. Kirby and Stillman set the tone for our consultants. We search out persons who are comfortable working in informal settings with adults and young people, who convey ideas clearly with a sense of humor and a wide range of approaches and techniques to the art of writing. We have had some success with the "subject area" consultant whose expertise is not the process of writing, but the process of investigating a specific subject area and then writing about it.

The third year, we began to focus on involving more adults in the camp. The first two years, the adults were KWP Teacher/Consultants--K-12 classroom teachers who had been selected for participation in the KWP Summer Institutes because of their success as writing teachers. However, funding for the expensive Summer Institutes came to an end, and at the same time one second-year camper was so successful at conveying his enthusiasm for the camp to his teachers that they wrote asking if they could come to camp, too. As a result, in 1986 we offered our first three-week workshop open to all teachers, held concurrently with the writing camp. Since then, the workshop has become an integral part of the camp.

In the week preceding the camp the teachers review research on teaching writing, develop strategies for working with small groups, and work together themselves in writing groups. In a typical workshop, participants might listen to lectures on composition and rhetoric theory, review bibliographies, discuss this material in light of their own classroom experience, view video tapes and live demonstrations of classroom strategies during the morning, and in the afternoon work in small groups editing writing that came out of a demonstration session, or reading in theory and/or pedagogy. Out of all of this, they develop materials for camp workshops, and strategies for small group interaction to be used during the week of the camp and in their own classrooms.

During the week of the camp, workshop participants assume the roles of adult writers. They try to be collaborators rather than teachers, working with younger writers on-on-one, asking for and accepting suggestions for their own writing from the students. Each group has at least two adults, but never more older writers than younger ones. The adults in the groups also act as coordinators, getting group members to workshops and field trip meeting points, and keeping all writers in the groups on task. To prevent burn-out, the adult writers participating in the workshop go home at 4:00; the director and MFA graduate students in writing who may also conduct some of the workshops act as writers-in-residents in the dorms.

In the week following the camp, workshop participants devise ways to implement what they have learned in their own classrooms. They present short demonstrations, explaining how they will integrate the experiences of the workshop and camp in their own classrooms. Their comments should reflect both the theoretical base expected of a trained professional and the practical expertise of a veteran small group participant. During this week, the camp publication is prepared for the editor.

The workshop has proven to be as effective as the camp itself: two years later, the 1986 group of teachers was still meeting together several times a year.

Working with student writers as equal learners is something that most teachers have never done before. As one adult commented, "I always had faith that students could help teachers learn, but I never fully understood the power of those words." Teachers need to work with students to try out some of their ideas, to see others' ideas in practice, and to become comfortable with the structured informality and the self-revelation of teacher-student collaboration. Outside the classroom, in the Summer Writing Camp, they have the freedon to risk this approach. The assessment of Ed Longmire, a KWP teacher/consultant who participated in the first camp, reflects the apprehension and success of the experience:

> I confess to feelings of apprehension...I feared that we would find motivation and maintaining a high level of interest difficult at best. I am pleased to say that I was totally wrong. I was gratified, somewhat surprised by the willingness of these kids to work at a demanding and difficult activity such as writing. And they kept it up day

1222

> after day. Perhaps they were willing at the beginning because they brought their own motivations with them, but I am sure that it would have been very easy to kill their enthusiasm and to turn them off. When I heard what came out of the work, when I saw the relationships forming, when I saw the reluctance of many of the campers for the week to end, and when I heard reactions come in from the perspective of a week's time away, I was convinced that here was one of the more valuable things a teen could do with a week during the summer.

In addition to this attempt to integrate "the vertical," we also looked for ways to expand this model "horizontally;" that is, to involve other disciplines in order to demonstrate the flexibilty and fluency that creative activities such as writing nurture. The emphasis during the camp week has always been on trying out as many writing methods as possible in as many situations as possible so that when the writers begin to put words on paper, they have a wealth of material to draw from. We find that while young writers do not lack confidence, as older writers often do, they do often overlook the obvious in their search for meaningful subjects to write about. Essays on their writing preferences that accompany the students' camp applications seem to fall into predictable categories: mystery-adventure-fantasy; "feelings" poetry; "save-the-world" journalism; practical career and hobby writing. One of our biggest challenges has been to help these young writers see that the world around them--people, places, events in their surroundings--is infinitely richer in possibilities than the formulas that pull them into imaginary worlds where they believe they are "safe" from comparison, where no one can "check up" on them and force them to reveal too much of themselves and their inexperience. As Jacqueline Berke points out in *Twenty Questions for the Writer*, young people seem to feel they have to be hit by a truck in order to have something to write about. To help the campers see these possibilities, we build into every camp as many horizontal experiences as possible--field trips, consultants, films, panel discussions by professionals who can bring a new perspective to what looks like dull reality.

In 1986, as we planned a trip to the local zoo, we hit upon a theme for our week, which until then had been generic. That year, we explored jungle "interiors." In 1987, "Prairie Roots and Tall Tales" took us another step horizontally, with William Ferris, director of the Center for the Study of Southern Culture as our consultant, and field trips to area museums designed to encourage participants to develop expertise in collecting information. We hope this interdisciplinary approach expands the young writers' horizons, and helps them develop enough confidence to write about the world around them. At the same time, this emphasis should help teachers recognize the value of cross-area studies, and give them some practical experience in implementing integrated programs in their own classrooms.

There is another aspect of this horizontal integration: writing workshops. Since 1986, when the camp came under the sponsorship of the English department rather than the Kansas Writing Project, faculty and MFA students--

"practicing writers"--have conducted workshops in poetry, fiction, drama and journal-writing. The knowledge and enthusiasm of these writers has been a key factor in the development of the camp. They act as catalysts in the interaction between the young writers and the teachers. Their enthusiasm for the craft of writing, shared in workshops and in the dorm, where some of them act as supervisors, is infectious. The workshops come in the middle of the week, after the consultant and field trips have given participants "raw materials" to write about. The emphsasis here has always been on converting that raw material into something creative: whether it is a poem, story, or journalism piece is not important. What is important is that the writers, both young and old, see the possibilities, the horizontal wealth of experiences and forms that writing presents. In workshop readings, video tapes, exercises and demonstrations these writers observe how other writers observe how other writers have turned an experience, observations, or object into a piece of writing or even several pieces.

Finally, returning to the "vertical", in small groups of adult and student writers--and in late night sessions in the dorm with the resident writers--pieces develop that began in consultant's sessions, on field trips, in workshops. Writing is read, re-read and revised. Adults have an opportunity to be teachers in a non-authoritarian setting, and to try out techniques and theories of conferencing and small group work that theorists, practicioners, and writers of composition and rhetoric texts advocate.

By the final read-around on Friday, both adult and student writers are eager to share pieces that they have developed during the week. Variety and effort, not adherence to popular formulas or formal school writing, is encouraged and applauded. Some still adhere to the predictable kinds of writing that they advocated in their application essays, but all of them have gained confidence. In 1988, for example, on their evaluations of the camp, students stated that they planned to write children's stories, folklore and plays, interview older relatives for a family history, start keeping journals, "do some poetry," write "a story about a girl during the Renaissance period who wants to be a painter," write "a story about a group of animals trying to do something important," write Indian poems, a mystery, a "dramatic monologue and maybe some fiction," fantasy, "get into other types of writing besides poetry," expand a short story into a novel.... and on.

The Summer Writing Camp is a residential camp. All students stay in a dormitory on the WSU campus. Activities literally go on day and night. Any student who has completed the eighth grade is eligible to apply. From the beginning, we have focused on these older writers because the motivation to write--often so strong in prepubescent children--seems to deteriorate dangerously in the high school years. Whether it is because students lose touch with some creative drive, become embarrassed about their own private thoughts, are distracted by the pressures of more formal academic atmosphere of high school, or encounter teachers who do not have the time or interest to encourage them, it is still unfortunate. These high school years are crucial in the development of students' interests and talents that may transcend the traditional disciplines lines that are demarcated in most U.S. secondary schools.

Students are selected for participation on the basis of their interest in writing and not necessarily on their writing ability, although we want them to be competent writers. With the application, the student is asked to include teacher's recommendation and a short essay on his or her writing experience, preferences, interests, and activities. A "good" essay is not a requirement for admittance: the purpose of the camp is to help people learn how to write, rather than to reward those who are already accomplished writers, although we recognize that most participants have been singled out as good writers, or they would not be encouraged to attend. A statement in our brochure cautions that the camp is not designed to meet remedial needs. Ample scholarship money assures that all qualified students can participate. The camp is promoted by sending information to all Kansas teachers who hold a language arts certificate and to middle level administrators. As a result, we have students from very small schools in the western part of the state, from Wichita and from the metropolitan Kansas City area. The student writers have been black, white, average, accelerated. Still, it is gratifying to see a shy writer blossom and mature as he or she gains understanding and confidence, or to see a fantasy-mystery writer venture into writing poetry.

As an interdisciplinary program, the Summer Writing Camp is probably unique. That the program is held on a university campus is another plus: the possibilities for integration with other campus activities and programs is limitless. Indeed, we have only begun to tap the models' possibilities. Why not invite adults who are not teachers to participate? Perhaps, in a year or two, we will expand the experience into an arts camp. The vertical camp model could be applied to studio arts, music, theater, dance and other liberal arts or professional disciplines. Similarly, the horizontal possibilities are limitless, using consultants, field trips and writing to investigate interdisciplinary themes. If there is a flaw, it is that to be successful, the program must remain small. The only solution to this problem is to encourage imitation. To all who participate, the benefits are greater than the sum of the parts. The possibilities--up, down, across and diagonally--seem endless.

FIRST CALL FOR PROPOSALS FOR 1991 NAHE CONFERENCE!

See HumaNews (page 50)

HISTORY'S FIRST INTERACTIVE, MULTIMEDIA ENCYCLOPEDIA

EDITOR'S NOTE: It is not our usual policy to print commercial press releases, but the interdisciplinary multimedia aspects of their announcement should be of interest to all humanities teacher.

NEW YORK--(September 20, 1989) Britannica Software, Inc., today introduced the world's first interactive, multimedia reference work--Compton's MultiMedia Encyclopedia.

"This outstanding reference--storing an entire 26 volumes on one compact disk--truly heralds the start of a new era, with sound, sight, animation and revolutionary new research indexes expanding the horizons of the traditional encyclopedia," Britannica Software President Stanley D. Frank said.

Britannica Software, Inc., is a subsidiary of Encyclopaedia Britannica, Inc.

Frank headed the team that created the CD-ROM (compact disk-read only memory) reference work, which he said marks the first time multiple mediums have been incorporated in a single computerized, electronic package.

"The implications of this are staggering," he said. "No one can predict how history will view this revolution, but--when grasping for a comparison--one recalls Gutenberg's use of movable type more than 500 years ago."

Frank said this new multimedia approach "enhances a student's capacity to understand and make connections among the millions of information bits in this world-class data base."

Features include:

--The entire 8.784-million word *Compton's Encyclopedia* data base preserved on a compact disk, along with more than 15,000 illustrations--the latter including an estimated 5,000 high resolution charts and diagrams, as well as more than 4,000 full-color illustrations and 800 full-color maps. In all, the electronic data base contains 5,200 in-depth articles, along with the more than 26,000 concise capsule entries.

--First-time ever use of audio in an electronic reference, with famous speeches, classical music and other sounds recorded as they happened--and, they are available as the student researches a particular topic. For instance, students can hear President John F. Kennedy on the occasion of his inaugural, as he beckons Americans to ask what they can do for their country.

The encyclopedia also includes 20 minutes worth of glossary terms (1,500 in all), actually spoken and defined for the student.

--Pioneering use of animation in a reference work, with 45 separate sequences preserved in the new, electronic Compton's. The sequences include an actual human skeleton. The video X ray demonstrates how the joints interconnect as the skeleton moves.

--First-time use of an entire dictionary as part of an encyclopedia, with *Webster's intermediate dictionary* (a Merriam-Webster, Inc., product) and its 65,000 entries available at the push of a button.

The software package operates on IBM-AT and IBM-PS/2 Model 30 personal computers, as well as on the compatible, Tandy Model 1000 TL. Compatible CD-ROM drives include the Sony CDV-100, Hitachi and AMDEK, with others possible becoming available later.

"Equally important as the media advances, from an educational standpoint, are the creative new research indexes that are built into the system," Frank said.

"In the work, we have incorporated several separate indexes--we call them paths--which enable students to get to the information in totally new ways."

Three of these are of particular significance in today's challenging educational climate, he said. They involve key problem areas in the schools must address--science, history and geography.

The science feature area is enhanced by use of the Science Feature Articles path, with articles selected by teacher panels drawn from across the United States. And, these special articles have been embellished with a greater number of animations, sounds and graphics, including the earlier-mentioned view of the human skeleton.

Another example, Frank said, is the U.S. History Timeline, which for the first time enables a student to see the chronology that is so vital to understanding history as it happened.

A student, by clicking his user button or "mouse," selects a timeline event he wants to focus on. There then appears a summary of the event, a list of articles related to the event as well as excerpts and renditions of famous speeches.

The World Atlas feature, meanwhile, provides yet another entry into the data base, by enabling a student to rotate a globe, select a country or city, then click to the related articles. And, a "zoom" feature allows students to explore the globe in even greater detail, with the ability to call up almost 1,000 articles on specific locations.

Other pathways include: the Topic Tree, with information organized in hierarchies and by topic: the Idea Search, which enables a student to type in a word or phrase and gain an entire listing of articles relating to the concept used; the Title Finder, an alphabetical listing; and the Picture Explorer, in which a student finds a picture that interests him, then clicks to a corresponding article.

"The ramifications of these indexes are truly enormous," Frank said. "Take the Picture Explorer. A student who is not especially attuned to textbook learning but who has visual orientation easily can find information on the pictures that excite his curiosity.

"That, in turn, piques his interest in the subject, and he finds the electronic encyclopedia a comfortable, user-friendly home for all his study and information needs."

Other key features include, Frank said:

--Article indexing, which means each article has its own index, enabling a student to go quickly to the specific part of the article that reflects his interest.

--Cross-referencing, with articles linked so students can proceed easily (at the click of the mouse) to related articles, then return to the original entry.

--Accentuated ease of use, using the simple mouse technique to click directly to the information desired.

Among other unique components of Compton's MultiMedia Encyclopedia are: on-line note-taking; use of an electronic bookmark that allows for later reference ease; a research path memory capibility enabling a student to easily click to any previous research; and a sophisticated search and retrieval system.

"In effect, Compton's has created the world's first totally integrated research tool that can be used right in the classroom and library," Frank said.

"We have not simply transferred a printed text to a computer screen. We have done much more, because we are using other mediums and sophisticated pathways to interconnect knowledge for the student."

Compton's Encyclopedia in its original print form is a major student reference work. Recently, the 1989 printing was lauded by the American Library Association in its July, 1989, *Reference Books Bulletin.*

Compton's MultiMedia Encyclopedia will be available Oct. 1 in a networked version, with the stand-alone version due on Jan. 1, 1990.

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

GOODBYE, EDITOR

"The Future of the Scholarly Journal", by Lauren H. Seiler in *Academic Computing*, September, 1989.

This news should make your day: what you are doing at this moment is doomed, at least in this format. It will be shortly overtaken and transformed into a digital electronic medium, and the effect will be both liberating and devastating. Rapid advances in five technologies are bringing this revolution upon us. Computer speed and capacity in processing, transferring, and storing information are increasing geometrically even as prices remain relatively constant. Dense communications networks are accumulating across the globe as a result of better hardware. Databases are growing in size, depth, and range, now including recordings, photographs, films, etc. Sensors (character scanners, voice recognition processors) can now translate information into digital form. Software involving machine intelligence of a high order is increasingly available.

Scholarly journals will have to respond to these changes, partly because the libraries which store them will. Pressures of space, the escalating cost of paper printing, cataloging and storage, are driving libraries to electronic storage. The print medium is dull and semi-informative beside the fulsome promise of image processing and other digital electronic complements. Libraries are opting for this larger range of information.

The internal dynamics of journal propagation will be changed, in some ways for the better. Articles will no longer have to be severely space limited; negative as well as positive results will receive their due; extensive tables and illustrations can be provided; delays of years between research and publication will be a thing of the past. Simultaneous, alternative viewpoints can be presented; informal conversations about an article can run on indefinitely. An "update trail" could be attached to an article as new information is available, thus keeping it indefinitely "fresh". Journals will be transmitted to subscribers electronically, eliminating processing and mailing costs. Multimedia, hypertest, and hypermedia will offer individualized paths through materials. Electronic journals could sponsor computerized conferences.

Now for the shift to a "Paradise Lost" theme: there will be unforeseen and perhaps unpleasant consequences. When the lengthy process of peer review and revision is bypassed, what standards of academic rigor will be maintained? With the academic journal resembling in format a trade magazine, using the same electronic processes, what kind of integrity can be maintained? Who will be allowed to exploit the possibility of changing an original article indefinitely? Cases of national security, patent infringement, fraud, or slander could well result from treating scholarly material like community property. Could pressure be brought to bear by offended groups to alter, or delete offending discoveries; or could a clever hack do it for them?

Centralization is an inevitable tendency. The best journals will publish increasing amounts of material; less highly regarded journals that used to catch the overflow no longer will do so. Electronic dispersion systems cannot handle all possible transmittals and so will settle on the real money makers. The libraries which store digital information and have adequate staff to see to its dispersion will be fewer and larger. Knowledge will be consolidated into fewer locations in a form where alterations to an original scholarly work are increasingly possible.

The economics of journal distribution will change dramatically. There will be no reason for an individual to possess his own copy of a journal; libraries will need only one, and there will be fewer of them carrying such materials. Will we go to a "pay-per-read" policy? Who will bear the cost of propagating a journal - the members of a professional association? Will the cost per member finally be prohibitive? In Lauren Seiler's opinion, "Because technology will permit us to do more, we may be compelled to do things of which we do not approve." If the future is coming as rapidly as the author believes, it is not too soon for NAHE to make plans about what to do with our own magazine. (Sharon Scholl)

DIFFERENT SNOWFLAKES, INC.

"Ready Fiction to the Bottom Line" by Benjamin DeMott in *Harvard Business Review*, May-June 1989.

Post-Modernist fiction for business executives? Well, perhaps, if we can agree with DeMott's lecture from a series sponsored by Philip Morris at Baruch College. The premise is one that has become increasingly familiar to humanities educators, but only spottily by corporate leaders and business school deans: literature provides case-studies in business that go beyond profit, growth, efficiency and competition into the ambiguous realms of human emotions, cultural values and philosophical questions.

Beginning with an analysis of Lionel Trilling's 1945 short story "The Other Margaret", DeMott (who teaches humanities and literature at Amherst) shows how a businessman, confronting an impulsive liberal minded daughter over a complaint about the family's black maid, finally recognizes that both the daughter's truth (*society* is responsible) and *his* truth (there must be *personal* responsibility) are both true. It is not a matter of tolerating alternative viewpoints; it is a matter of tolerating the paradox of opposing views being true at the same time. Still, DeMott says, the world of 1945 is not the world of 1989, and he places the story into its historical context of the closing years of World War II, which is not so significant for the businessman and daughter as the context of the post-Depression when business had been rescued, not out of its own values, but out of government actions, partly of the New Deal, but ultimately out of total war. The daughter, on the other hand, was voicing the platitudes of American marxism of the Thirties.

So what brings us to Donald Barthelme's post-modernist story "The Emerald"? Simply that the ambiguities have compounded, and stories like this "have become favored instruments for the moment-to-moment destabilization of reader's expectations." True, there still is a literary and dramatic mainstream of logical, serial narratives, but the new fictionists are teaching readers to live more dangerously with "a readiness to live along the nerves of a narrative in a condition of unprecedented, self-mocking, self-consciousness, a willingness to abandon feelings of confident mastery and to reject the conventional aesthetic hunger to transform a messy, unsettled world into a place of fixed, rationale continuities." Just like business.

Not exactly, but DeMott refers to James Gleick's *Chaos - Making a New Science* as well as to some works on business to show that in physics, mathematic and other sciences it is being recognized that the world *is* messy and unsettled, that chaos is always hand-in-hand with order ("why are snowflakes different" is no longer to be blithely answered that they are all six-sided and order prevails); survival and success alike in business, corporations, government and education increasingly require "readiness to live along the nerves of the narrative" of the Real World. (F.S.)

TV AS CURE

"History, Humanities and Media" by Ken Burns in *Humanities Discourse* 3:3 (June-July 1989) Federation of State Humanities Councils, 1012 14th St. N. W. Washington D.C. 20005. Free.

The loss of historic memory is epidemic, and it is easy for any of us who teaches humanities to add our anecdotes to the official pronouncements. There are remedies on a wide variety of fronts from cultural literacy tests to better-trained teachers. Television is rarely mentioned. However, Ken Burns, producer of videos on Thomas Hart Benton, the Civil War and the Congress, has much to say on the subject. The last, a *ten-hour* history of the U.S. Congress is one that makes his admirers balk. How can you make the Congress as appealing as art and war without injecting a lot of fiction, glitz and superstars? The essence of making the American heritage--even of the Congress--come alive, says Burns, "is having an emotional connection." He provides as an example the human drama of the Compromise of 1850, with Henry Clay, ill and enfeebled, being helped into the chambers, Daniel Webster, sustained by stimulants, arguing passionately, and John C. Calhoun so weakened that another senator had to read his speech. When something matters that much, young people will want to know what and why, and they'll remember.

In this address to potential congressional supporters of NEH funding, Burns also underscored NEH Chairman Lynn Cheney's admonitions about the importance of historic memory. We must remember slavery, he says, because we must remember the underlying rift of racism that is still with us. Abolishing slavery out of mind does not abolish the prejudicial dichotomies of social and economic class differences.

People of the past seem remote and different to many who are historically ignorant. But the Americans of the 1850s were not so different. "They were health faddists and faith-healers, into nature cures, water cures, free love and women's rights.... Two days after the first Battle of Bull Run .... real estate speculators bought up the battlefield to make a second killing as a tourist site." TV may be a cause of cultural illiteracy, but it may also be part of the cure. (F.S.)

SIGNS OF CHANGE

"Changing the Curriculum in Higher Education" by Margaret L. Andersen in *SIGNS: Journal of Women on Culture and Society* 12:2 (Winter, 1987). University of Chicago Press

Changing the curriculum anywhere or any way is always difficult, but when you are trying to change minds and society as well, the task is greater. Moreover, changes don't always take place as you anticipated: indeed that ought to be understood as the most predictable outcome when readjusting such a dynamic system as American education where social changes in the institutional climate are always out of step with the social changes in the lives of our clienteles, the students, parents and citizens.

The changes of which Andersen writes relate to the general area of women's studies, but as several of the many sources she draws upon indicate, there is almost no neutral word for the sort of change that is desired. "Balance" could imply a goal of setting forth all perspectives, including racism, nihilism, creationism, communism, sexism, feminism, and so on as "equally accurate or significant." How about "integration"? That has the same implication as "mainstreaming" of being absorbed into the male-made dominant curriculum.

The actual way in which changes occur also points up the power of little words. Peggy McIntosh characterized five phases in the process of curricular change: (1) woman*less* history, literature, science, sociology, etc.; (2) woman *in* history, etc.; (3) women as a "problem, anomaly, or absence." At this phase feminists begin to challenge the canons of the disciplines and redefine terms relating to the human experience. (4) "women on our own terms," maintains that "women's experiences and perspectives create history, society and culture as much as do those of men," and the fifth phase (5) spaces out into "lateral consciousness," sort of a super-caring one-world. Andersen, who is a sociologist at the University of Delaware continues with thoughtful and knowledgeable analyses of the peculiar problems of each discipline in producing the ultimate goal of "an inclusive curriculum." Women's studies itself is given equally close scrutiny because it is so easy to think that the gains for educated white women represent and express the ideas and values of poor, uneducated women, or of women from other cultural traditions. Nevertheless, she warns, even funded projects to revise curricula toward feminist ends are suspect, for they are "typically designed to retrain male faculty." (F.S.)

I GO POGO

"Extra-Academic Agents for Cultural Literacy in America" by Fred E. H. Schroeder in *Journal of American Culture*, Summer, 1989. Bowling Green University Press, Bowling Green OH 43403. $25/yr.

The "cultural literacy" crisis of best-selling professor E. D. Hirsch may or may not be real, but it is wrong to lay the entire blame on the doorsteps of educational institutions. Schools may be the only apparent source for the small change of culture--authors, titles, famous events, great persons, gazeteer-knowledge, myths, legends, dates, tag-lines of poems and the like--but this idea greatly oversimplifies the complexities of the "American educational system" and it naively assumes some Golden Age of cultural literacy in the past. There are fallacies here. For one thing, E. D. Hirsch and Schroeder (the editor of *Humanities Education* who authored this article) were far from dependent upon schools for basic cultural literacy. One way, or many others, this was nurtured and fostered in the home. The home influence can range from that of impoverished parents who yet respect book-learning and take advantage of whatever resources they know of and are available cheaply, such as Sunday schools, public libraries, radio and television, to well-off parents whose houses are museums, children's libraries and symposia all rolled into one.

Schroeder points to a recent study that shows that on the average children by age twelve learn about 5000 words per year, but only 200 are taught in school. He checked this against the old *McGuffey's Readers* and found that in that "Golden Age" the schools were teaching 1200-1500 words per year, which still leaves a good 3500 words annually to be picked up in "barnyard, byway and Bible"--or television, comics, games and books. These are what Schroeder means by "extra-academic agents" and the body of his article demonstrates how long they have existed and how pervasive they may be. Card games of an educational type date back to 1502; the *Authors* card game began (in the United States) in 1843. Picture-puzzles of maps, Biblical board-games and anagrams are as venerable, while *Trivial Pursuit* is a recent version of a cultural literacy-fostering game. The extra-academic agents also go beyond trivia, for cheap, attractive classics for children and adults have been available door-to-door, by subscription, in supermarkets and drugstores for the past 50 to 100 years. Schroeder particularly discusses *The Book of Knowledge*, *My Book House*, *Childcraft* and *Golden Books*. Ultimately, though, the problem and the solution is in parent's hands. Blaming schools, even helping schools is nowhere so effective as parental examples in home reading, choice of programs on television, regular use of the library, reading aloud and using an intelligent vocabulary. Schroeder concludes, "We have met the enemy, as culturally literate Pogo said, and they is us." (F.S.)

HUMANITIES EDUCATION
HumaNews

Official Newsletter of the National Association for Humanities Education

---

EDITOR'S NOTE: Member-subscribers are invited to submit personal newsbriefs about their activities, publication, awards. We will be pleased to print announcements of upcoming conferences, calls for papers, fellowship and seminar opportunities relating to humanities and arts interdisciplinary education. Such announcements should be submitted at least three months in advance of events or deadlines to ensure properly timed publicity.

Send all news items, announcements, and brief comments to Darrell Bourque and Vaughn Baker, Editors **HumaNews**, Drawer 44691, University of Southwestern Louisiana, Lafayette, LA 70504-4691.

NATIONAL ASSOCIATION FOR HUMANITIES EDUCATION: BOARD OF DIRECTORS

President
Sharon Scholl
Professor of Humanities
Jacksonville University
Jacksonville, FL 32221

Past President and Executive Secretary-Treasurer

Fred E. H. Schroeder
Institute for Interdisciplinary Studies
420 Humanities Building
University of Minnesota, Duluth
Duluth, MN 55812-2496

Vice-President/President-Elect

James V. Mehl
Missouri Western State College
4525 Downs Drive
Saint Joseph, MO 64507-2294

NAHE MEMBERSHIP ALERT!

In the Summer issue of HUMANITIES EDUCATION it was announced that the Board has authorized an increase in membership fees from $16 to $20 per year, effective January 1, 1990.

However, we invite you to renew or extend your subscription at the $16 rate until January 1. Send check to HUMANITIES EDUCATION, 365 ABAH, University of Minnesota, Duluth, Duluth, MN 55812-2496.

_____ One year $16
_____ Two years $31
_____ Three years $46

(These special two and three year rates are only for *current* members)

This offer is good through December 31, 1989

CONFERENCES, PAPERS, FELLOWSHIPS, GRANTS, ETC.

Conferences

Annual Popular Culture and American Culture Association Convention. March 7-10, 1990. Toronto, Canada. For membership information contact: Ray Browne, The Center for the Study of Popular Culture, Bowling Green State University, Bowling Green, Ohio 43403.

Interdisciplinary Nineteenth-Century Studies. March 30-31, 1990. California State University, Long Beach. For information contact: Roswitha Burwick, Scripps College, German Department, Claremont, California 91711.

Re-Visioning Knowledge and the Curriculum: Feminist Perspectives. April 19-22, 1990. East Lansing, Michigan. For information contact: Women's Study Program, 300 Linton Hall, Michigan State University, East Lansing, Michigan 48824 (517) 355-4495.

NAHE 1991

The National Association of Humanities Education invites submissions for papers, panels and discussion workshops for presentation at its biennial conference to be held **April 18-20, 1991** in Lafayette, Louisiana. The conference will be held during Lafayette's Festivale Internationale, one of the top 100 music and arts festivals in the United States. The Festivale features musical and art performances from Canada, Africa, the Caribbean and the United States. **The theme of the conference will be "The Global Humanities: Unity in Diversity."** Papers should be planned for twenty minute reading time; panels and workshops should be limited to an hour and a half. A one-page abstract for each presentation should be submitted by September 1, 1990. Proposals and inquiries, contact: Darrell Borque and Vaughn Baker, Drawer 44691, University of Southwestern Louisiana, Lafayette, Louisiana 70504-4691.

Fellowships and Grants

December 15. Humanities. Applications for resident postdoctoral fellowships for research on "issues critical to an understanding of the Hispanic/Chicano experience in the context of the changing Southwest." Southwest Hispanic Research Institute, University of New Mexico, Albuquerque, NM 81731.

December 15. Minorities and Women. Application for minorities and women scholars for postdoctoral research fellowships. Contact: President's Fellowship Program. University of California, 359 University Hall, Berkeley, California 94720 (415) 643-6057.

February 1. Research and Writing Grants on Peace and International Cooperation. Encourages applicants from a variety of disciplines. Grants last up to eighteen months and range from $10,000 to $60,000 for individual application; up to $120,000 for two-person project. Contact: Research and Writing Grants, John D. and Catherine T. MacArthur Foundation, Program on Peace and International Cooperation, 140 S. Dearborn Street, Chicago, Illinois 60603.

January 15. Travel to Collections. Grants for Research Travel in U.S. and abroad. For 1990 Guidelines and Applications Materials contact: Program Officer, Travel to Collections, Division of Fellowships and Seminars, Room 316-KM, National Endowment for the Humanities, 1100 Pennsylvania Ave., N.W., Washington, D.C. 20506 (202) 786-0463.

February 1. Rockefeller Foundation Humanities Fellowships. Institution Applications. Seeks to promote interdisciplinary dialogue in the areas of international issues, foreign languages and literatures, cultures of non-Western nations, or aspects of American cultural pluralism. For application packet and detailed instructions contact: Humanities Fellowships, The Rockefeller Foundation, Arts and Humanities Foundation, 1133 Avenue of the Americas, New York, NY 10036.

December 1 - February 15. Residency sites for programs inviting application by individual scholars who are testing disciplinary boundaries or moving into new fields of inquiry within the humanities. These sites are too numerous to list here, but they are listed in **The Chronicle of Higher Education**, October 18, 1989, p. A8.

Papers

Abstracts for papers on the theme **"The Global Village: Ethics and Values,"** for possible presentation at a conference to be held in February in Miami Beach. Contact: Barry University, Department of Theology and Philosophy, 11300 N.E. Second Avenue, Miami Shores, FL 33161 (305) 758-3392, ext. 530, 528, or 372 (no deadline given).

December 31. Renaissance Studies. Proposals for possible presentation at the South-Central Renaissance Conference to be held in March in Memphis. Contact: Darryl Tippens, ACU Station, Box 8235, Abilene, TX 79699.

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity**, **humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"

THE NOVEL AS RESOURCE: AN INTERDISCIPLINARY APPROACH. THREE ESSAYS ON *THE AUTOBIOGRAPHY OF MISS JANE PITTMAN*

"We hope that this exercise in defeating the blindness of single-disciplinary inquiry will lead to fresh perspectives on the rich nature of the novel as a resource in the interdisciplinary classroom."

Introduction

One of the basic premises from which interdisciplinary inquiry begins is a belief in the value of subjecting one's home discipline to the subjects and methods addressed by other disciplines. But as anyone knows who has leapt forth into the misty world of interdisciplinarity, bridging the gap between premise and practice is not always, not even often, easy. We constantly seek either new approaches or fresh ways of applying tried-and-true ones to aid us in clearing the mist in our own minds and in our students' understanding. Using the novel as a resource in teaching history or folklore is certainly not a new idea, and discussing teaching the novel in English classes is almost a *reductio ad absurdum*. But in the following three essays, three of us will discuss the novel as an interdisciplinary resource. We are not attempting a theoretical presentation defending an already generally accepted concept--an exercise in preaching to the converted. Instead, we have selected one novel, Ernest J. Gaines' *The Autobiography of Miss Jane Pittman*, (New York: Bantam Books, 1971, 1986) as a case example; each of us has then approached it from our own primary disciplines. In doing so, we are seeking new insights into ways of utilizing a novel to reach new understandings or to reinforce old ones. We hope that this exercise in defeating the blindness of single-disciplinary inquiry will lead to fresh perspectives on the rich nature of the novel as a resource in the interdisciplinary classroom. Gaines' novel provides particularly rich opportunities for interdisciplinary analysis, and can be variously interpreted from the perspectives of history, literature or folklore.

1244

Ernest Gaines was born on a Louisiana plantation in Point Coupee Parish in 1933. As a young black boy growing up in rural Louisiana in the depression, he developed a keen insight into the southern experience. Because his mother had to leave the south to make a living, he was raised by his aunt, a woman of great moral strength and courage who cooked and cared for several children despite a severe crippling handicap. He joined his mother in California when he was thirteen in order to obtain the education Louisiana denied him, and he lived in San Francisco until accepting the position of writer-in-residence at the University of Southwestern Louisiana in 1984. Louisiana never left his consciousness, however. Winner of the Joseph Henry Jackson Literary Prize, Gaines has earned the reputation of one of the strongest voices in black literature in the United States today, a reputation based on novels and short stories steeped in the Louisiana experience. His achievement rests in part in his stylistic power and in his ability to create a world that, while set in Louisiana, is universal in its moral and social dimensions.

1. The Historical Perspective

Vaughan B. Baker

Gaines' *The Autobiography of Miss Jane Pittman* is a novel in the guise of the tape-recorded recollections of a 110-year old Louisiana black woman who remembers slavery, emancipation, reconstruction, the depression years and the civil-rights awakening of the early 1960s. In the introduction, the "editor", speaking in the first person, tells us that he (or she, for we cannot tell) had tried for years to persuade a stubborn Miss Jane to tell the story of her life. In the first few lines we get a glimpse of Jane's feisty spirit and, at the same time, an introduction to the spare richness of Gaines' style, which packs as much meaning into a handful of words as Picasso does into a drawn line.

> "What do you want to know Miss Jane for?" [her companion] Mary said.
>
> "I teach history," I said. "I'm sure her life's story can help me explain things to my students."
>
> "What wrong with them books you already got?" Mary said.
>
> "Miss Jane is not in them." I said.

In a trenchent line on the first page of a novel which is a first-person limited journey through more than 100 years of turbulent human history, Gaines demolishes the historians and their dry-as-dust approach to the past. In that one line, "Miss Jane is not in them," he goes beyond attack to an assertion--that history is far more than the history books as presently written tell. Many historians and philosophers of history stand with Gaines and in far more arcane and academic language have made the same assertion, though few so forcefully.

In the ensuing chapters Gaines tells us, through Miss Jane's very selective memory, of her encounter with a Union soldier late in the Civil War (he gives the ten or eleven-year-old black slave child a new name to which she clings adamantly despite beatings from her owners and threats of being sold or killed); of a march after emancipation with other freed slaves toward some unspecified and only vaguely conceptualized place of freedom during which the former slaves are hunted down and killed by the "Secesh". Eleven-year-old Jane adopts five or six-year-old Ned after his mother, one of Gaines' many strong, intelligent, giving women, is killed. Jane's later memories recount Ned's murder by a Cajun named Cluveau and even later the murder of Jimmy the young black leader who emerges after the Second World War and who attempts to shake the plantation blacks out of their docile fear and subservience to the by now economically sanctioned white supremacy. Jane's memories are usually emotionally vivid and factually vague--she tells her story without dates, usually with only a very limited perception of outside cause. "[Ned] is buried 'side the place where he was building his school," she tell us, "The people finished the school after his death, but it was destroyed during the second high water. That was back in '27 when we had a very bad high water. We had one in '12, but the one in '27 was much worse." Later, she says Ned died "at the end of the other century and the beginning of this century." Dates are marked by experience; the disastrous 1927 Louisiana flood is remembered for its personal cost, as "the second high water" which destroyed Ned's school.

Jane's perceptions of individuals are also quite subjective. Cluveau and his Cajun relatives are not objective portrayals of Louisiana's Cajun population; they are Cajuns as perceived by the blacks who suffered from a particularly virulent kind of prejudice that existed in an economically and socially marginal white French-speaking population struggling to survive in a depressed environment dominated by an English-speaking plutocracy. Tee Bob, the white son of the plantation owner for whom Jane works and his parents are seen even more dimly--the white master class which is at one and the same time familiar through daily interaction and yet ever distant. Cluveau and Tee Bob and an amorphous white "they" are the villains of the story, the perpetrators of the violence recurringly visited on the blacks. Jane's account of black/white relationships from slavery to civil-rights is consistent in its black perspective and is filtered through an often vague but never dispassionate memory. Anger and hatred do not dominate her, however; instead a sad resignation and a spirited endurance characterize Jane's attitude. Her unconscious and therefore all the more powerful compassion reveals a poignant human experience in which blacks and whites alike are victims of a cruel, inhumane system that crushes all. Tee Bob, who kills himself because of his socially tabooed love for a beautiful young "colored" teacher, and Cluveau, who kills Ned but lives out his life in a torment of guilt, are, in Miss Jane's tale, as violated by the racist system as are Ned or Jimmy. Gaines' moral imagination surveys the brutal experience of slavery and Jim Crow and rises above petty response to a universal perspective on the human condition. If it is a brutal vision, it is not a tragic vision despite the tragedies it encompasses, but one infused with a compelling sense of the strength and dignity of human nature.

This novel provides exceptionally rich opportunities for the historian. Its subject is racism; its theme a wrenching plea that human beings rise above past

1246

experience and social conditioning to a recognition of shared humanity. *The Autobiography of Miss Jane Pittman* is not a history book, footnoted from the documents, replete with hard facts. Properly used, however, it becomes a springboard to a more vital historical truth than properly documented history books usually can provide. Novels are constructs of human experience, and histories are too. The first, however, are unabashedly fictional; the second purport, at any rate, to be "true", to present facts, to reveal the past, in Ranke's often-quoted phrase, *"wie es eigentlich gewesen ist"*-- as it really happened. But therein lies the rub. Defining what actually happened too often becomes a listing of dates, or numbers and statistics--a game for squint-minded antiquarians. (The term is not mine, but John Barth's, in *The Sot-Weed Factor*.)

Shirley Wilton, Associate Professor of History at Ocean County College in New Jersey, writing in the December, 1987 issue of the American Historical Association newsletter, *Perspectives*, notes the popularly-held view of history as "a collection of unchanging dates and unchallenged conclusions." Perhaps the best argument for utilizing such fictional works as *The Autobiography of Miss Jane Pittman* with novice students of history is its power to explode that misconception. At least in my experience as well as in Professor Wilton's, it does still prevail among the students I meet in classrooms at almost every level. Unfortunately, that includes even some graduate students I have recently met, to our mutual frustration.

The humanities can, and history I firmly believe does, link the sciences and the arts. The humanities rely on reason, logic and diligent scholarship, but also on imagination and intuition. Unlike the sciences, the humanities are not, or should not be, value-free. Miss Jane's account of her experiences as a black woman from slavery to civil rights potentially opens a number of discussions that can aid a student in moving from the scholarly "logic" of textbooks to the intuited "truth" of the human past. Gaines shows us the black woman's experience from a number of perspectives: Jane's; Ned's mother, Big Laura's, who leads the confused and child-like freed blacks after emancipation only to be killed with her baby by the "Secesh"; Molly's, the elderly house servant who was scared that "if she got help the next thing the other person would be taking over" and who tried to get Jane out of her kitchen by lying to the white mistress and by emotional blackmail when lying failed; Black Harriet, the mentally-retarded Queen of the Cotton Field, who could pick and chop more cotton than anybody else but who loses her mind completely when seriously challenged in the fields. But he also shows us the white woman. If we see Tee-Bob's mother's pain after his suicide only through Jane's eyes, we see it nevertheless. We see the men only through the women's eyes, but we see their conflicts, their courage, and often their guilt, as we do Cluveau's. If the purpose of studying history is to gain a sense of how the past really was, then we must not rely solely on statistics, on numbers, and on dates. The number of black women working the cotton fields in the pre-World War II era is far less meaningful in understanding the reality of the past than is one Black Harriet, although the number takes on new meaning after Black Harriet is understood.

The Autobiography of Miss Jane Pittman allows historical inquiry to move from a factual-oriented approach to an inquiry-motivated approach. Gaines' novel cannot wholly substitute for the history book--that book filled with "facts"--but it can stimulate a far greater interest in the history book and a greater ability to evaluate the information the history book provides. Etymologically, history means "inquiry"--it is from the Greek "historia," learning or knowing by inquiry. I like to tell my students that it is a "Sherlock Holmes endeavor." But pursuing a hypothesis about the past and learning to deduce accurately from the empirical evidence found in documentary sources requires a kind of intuition and imagination that today's television-trained students find difficult to muster. Gaines' example through Miss Jane Pittman's factually cloudy but emotionally pellucid memory provides an ideal model from which to develop in students a genuine historical consciousness.

We do not need to seek historical data in Miss Jane's memories. We can instead let her teach us a lesson in historical-mindedness. The elements of historical-mindedness include a sensitivity to how other times and other places differ from our own. Acquiring the ability to project oneself into a past time calls for the same imagination we must exercise when we read fiction. Historical-mindedness also requires an awareness of basic continuities in human affairs over time combined with an ability to see and explain change. This is particularly hard for today's present-minded students, and even for many presentism-oriented faculty. They cannot instinctively recreate the past. They need a model. Without preaching as textbooks do, without specifying as "how-to-study-history" books do, Miss Jane gives us as clear a model of historical-mindedness as we need. Her story is more valuable, more effective in developing an ability to perceive and to appraise the flow of history from the perspective of one human being than even the self-conscious historically verified memoir or diary. Moreover, Jane's voice is that of one of the most elusive of historical subjects--the underclass who left almost no written accounts of any kind. She allows us to tap into the emotional realities of the population that made up the largest numbers of the social strata throughout most of human history. Louis Gottschalk reminded us of the inadequacies of the historian's tools when he said, "History is a damn dim candle over a damn dark abyss." Students need to recognize the depth of that abyss, and that they need a stronger light.

Writing in the March 14, 1988 *New Republic*, U.C.L.A.'s Eugen Weber (Weber has for years been one of my personal historian-heroes) says, "The historian's job is to pry into other people's lives and business to force their privacy, uncover their motives, imagine how acts and situations have come about." Gaines doesn't say it quite the same way, but his *Autobiography of Miss Jane Pittman* defines the historian's job in exactly the same sense. Gaines would agree when Weber insists that history must be about people, about the places where people move and act, about the nature of the place and its effect on people, not "a lot of airy-fairy stuff about ideas." Gaines gives us a not a scientific, value-free history but a value-laden history of people who, though fictional, are true to the spirit of the southern past.

He gives us ideas too, though not "airy-fairy" ones. I had an interesting reminder of the universality of the ideas he moves us to confront in Amsterdam last summer. The marquee of a major downtown movie theater announced in large letters and bright colors the showing of the recent production (aired in the United States on television) of Ernest Gaines' *A Gathering of Old Men*. Gaines's concern with the complex social and interpersonal dynamic of racial relationships, his analysis of the impact of social system and place on the individual, his subtle probing of gender in both black and white society and his relentless moral indignation appeal across national and linguistic lines. Certainly they can appeal across disciplinary lines as well.

In conclusion, if Miss Jane's memories give us a slanted perception of history, and they do, therein lies much of the value of this book for the history classroom. Napoleon said "History is a myth that men agree to believe." If students are to develop a true appreciation of history and a genuine historical consciousness, they must develop an understanding of this facet of history as well. Jane's history is largely a personal myth as Jane herself is a myth. Like all myth, her story both contains a kernel of fact it shapes a new present. Jane tells us a great deal, but one of the things she says most clearly is that any history is really *histories*, depending on whose prism refracts it. If, as R.G. Collingwood insisted, "Nothing capable of being memorized is history," then Jane can help us teach our students a more viable kind of history, one that bridges the intellectual chasm that separates the Rankean past from the past of the historian's imagination, and one that gets away from the textbooks and shapes a new appreciation in a present-minded generation of students.

2: An Arts Perspective

Darrell Bourque

When one presents to a group of humanities students the influence of one art form on another, the case is usually less clear cut than in the case of Victor Hartmann on Modest Mussorgsky. In February 1874 after Hartmann's untimely death, an exhibition of 400 or so sketches, watercolors, costume designs and architectural drawings were displayed at the Academy of Fine Arts in St. Petersburg. Mussorgsky went there to see the works of his friend and was immediately moved to begin a musical composition. By July he had finished the suite of tone pieces for piano based on ten of the works he had seen there. These tableaux are named for the specific art works beginning with *Gnomus* and ending with *The Great Gate of Kiev*. Incorporated into the piece is the promenade theme suggesting the composer's movement from picture to picture. As Mussorgsky was working on *Pictures at an Exhibition*, he acknowledged the direct influence of his friend and his friend's art work: "Hartmann is boiling as *Boris* [his great opera] boiled" (Murray). Hartmann is central to *Pictures*.

The case of Mussorgsky's influence on contemporary writer Ernest J. Gaines is less easy to document, but perhaps all the more interesting because of that fact. Gaines' work, as Mussorgsky's, falls into that category of romantic realism. Both use folk motifs, programs, rhythms, etc.; fabulistic rather than realistic to the ear and eye seeing their worlds for the first time. Both might be said to be creators of a nationalistic art. Such is the claim made for Mussorgsky by Milo Wold and others (256-258). From the outset Gaines' work would tell the story of a people whose real lives were absent from the canon of American literature—his people—the blacks of south Louisiana.

Interestingly, when Gaines credits influences and those he has emulated, the great Russian writers of the nineteenth century are always at the top of the list. In them he sees a treatment of the peasantry that informs him in the depiction of his own characters. He recounts that Tolstoy says, "You just watch a serf, just watch him. He'll never tell you the truth" (Gaudet and Wooton, 66). Then Gaines adds, "now if you watch closely, you'll figure out the truth, but boy he's going to lead you all through the swamps, all through the woods, and then you get it. Then you get the truth out of him, and I learned that from just listening to these guys tell a story" (66). Which takes us to the focus of our discussion here. The fictional student editor in the "Introduction" to *The Autobiography of Miss Jane Pittman* says, "There were times when I thought the narrative was taking ridiculous directions. Miss Jane would talk about one thing one day and the next day she would talk about something else totally different. If I were bold enough to ask: 'But what about such and such a thing?' she would look at me incredulously and say: 'Well, what about it?'. . . I would say, 'I just want to tie up all the loose ends.' Mary [her friend] would say, 'Well, you don't tie up all the loose ends all the time.' Then both of them would look at me as if I had come into the room without knocking" (*Pittman*, vii).

Gaines also acknowledges that he is influenced by painting, albeit less directly than Mussorgsky in "Pictures." He says, "Just look at paintings and see how you can describe a beautiful room with only two or three things .... Right now I'm thinking of Van Gogh's ... *Vincent's Room* ... and how he could do it so well with only two or three things or pieces of things" (Gaudet and Wooton, 66).

Of influences, Gaines says his most important relationship was with his beloved agent, Dorothea Oppenheimer. He says, "She would suggest things, and it was her opinion I appreciated more than anyone else's" (68). From early on in his career it was Oppenheimer that was urging him to museums, to music he could learn from. In a conversation in April 1988 he told me that she had suggested "Pictures" to him, that she had urged him to listen to how pieces of sound create tone. He said that he got from that listening a sharpening of the understanding of how the "rat tat tat" in high notes could suggest strife, how a few long, slow pulls of sound could produce lumbering or sadness. In fact, he says that at the time he was writing *The Autobiography of Miss Jane Pittman*, published in 1971, he was listening to Ravel's 1922 or-

1259

chestral transcription which popularized the Mussorgsky piece: "I played *Pictures at an Exhibition* just about every day while I was writing it--two years I guess--maybe I needed that to get started" (67). Furthermore, Gaines says that one of the earliest titles for his novel was "Sketches of a Plantation" (67) and adds "I was thinking about sketches of a plantation because I had been listening to that so much. I was thinking sketches, sketches, sketches, then I ceased thinking about sketches for the autobiography" (66).

Thus, the time for conscious influence was over as it must be for any artist. The time of "boiling," to quote Mussorgsky, had begun. Jane Pittman's story would not be sketches. It would not be called *A Short Biography of Miss Jane Pittman*, an intermediate title, her story told by others after her death. The novel would be published *The Autobiography of Miss Jane Pittman*, and she would be the lead narrator or tale-teller even if others were to talk for her from time to time, the point being that Jane's story is theirs and their story is hers. But the finished work does not ever extricate itself neatly from all that comes before it and there remain interesting parallels, clearly and correctly not consciously wrought, in Mussorgsky's *Pictures* and Gaines' *Jane Pittman*.

The novel is composed of "Introduction" followed by four sections or books: "The War Years," "Reconstruction," "The Plantation," and "The Quarters." "Introduction" states the theme and reveals the technique which will render theme. The work will be a history of a people in a particular person. The student editor tells that he "could not put down ... everything that Miss Jane and the others said....," that he would not "write everything but in essence everything that was said" (vii). The theme, as in a musical piece is immediately established. He adds that he tries to be faithful to rhythms of her speech, to the economy with which she used words, and the way she repeated words when she "thought it might add humor or drama to the situation" (vii). Sound is a crucial element in this novel. Repetitions, modulations, tonalities, phrasing, etc., have musical as well as literary application here.

A few examples show language working as sound does in music to establish motif. Jane's first sentence: "It was a day something like right now, dry, hot, and dusty, dusty". Then in subsequent pages of the beginning: "All I can see is that dust way up in the air," "My mistress was standing on the gallery watching the dust rising over the field, and just crying. 'Sweet, precious blood of the South; sweet precious blood of the South.' Just watching the dust, wringing her hands and crying," "spotted that dust in the air," "I stood there and watched the dust high over the field." Dryness is pervasive in this place where the child Jane still carries her slave name Ticey. At the end of the novel when Jane, over one hundred years old, is walking from the quarters to participate in the demonstration, she says, "dust in the road was still cool and soft," "All I could see was a dark form in the white dust" as she sees someone joining her, "just dark forms in that white dust" (243). In but a few steps Jane will have walked past the plantation owner Robert, past this dry land rendered in the dust motif established in the opening sentence of her history.

In many instances this repetition is condensed and the words create on occasion the brutal intensity of hard clashing orchestral sounds. In one such section Jane is fleeing from the "Secesh" army with the still younger Ned. She hides in the brush with her heart, "jumping, jumping, jumping" (21) as soldiers find the slow-wit and "started beating him with sticks of wood ... beating him with sticks. They beat him ... they beat him till he was down ... I could hear his head crack like you hear dry wood break". Then, "They moved in with sticks ... hitting against the bushes ... would surround a person and beat him ... hear them hitting against bushes lightly ... then after they spotted somebody you could hear them hitting the bushes hard. Now you heard screaming, begging; screaming, begging; screaming, begging--till it was quiet again" (21-22). An analysis of the passage clearly shows variations on the s, c. and b sounds, modulations masterfully worked until the crescendo in screaming-begging repetitions, and then the quiet again.

The structure of the novel in four large movements does create a large symphonic sweep. So large in fact that literary critics have compared the work to *The Odyssey* and *Huckleberry Finn*. But what is true of those monumental literary works, and of large musical works like suites and symphonies, is true of *Jane Pittman*. There is grandeur and largess in all, but equally strong are the unforgettable pieces that make up the whole tapestry. In *Pittman* each large movement does its work, but equally strong in "The War Years" is the portrait of the child Jane who is walking to Ohio and her charge Ned who carries like relics the stone and flint, all he has left of his mother Laura. In "Reconstruction" the portraits are of cowboy Joe Pittman, Jane's husband, of Ned who returns to Louisiana as teacher, and of Cluveau, his assassin. The tragic figures of Tee Bob, the white plantation owner's son, and Mary Agnes, the mulatto, are the chief portraits of "The Plantation." Jimmy, who is slain in the closing pages and the person for whom Jane is standing in the end, is the dominant portrait of "The Quarters." In addition to these major large portraits are the many smaller ones in the novel. Gaines certainly does move away from sketches for his larger aim, but he provides sketches nonetheless, and they are more than supports for his larger portraits. It is his student editor who tells us that his largest portrait and his smallest sketch are both part of the same thing, but presentation of a world and its people. A coincidence perhaps, but not far removed from one of the larger aims of Mussorgsky in his nationalistic works.

Finally, one of the most interesting parallels in the musical and the literary work is in the use of the walking theme. Mussorgsky uses his promenade to clearly introduce the first five pieces in the suite and then uses it within the remaining pieces until he gets to the triumphant sounds which "conjure processions, bells, and chanting" (Murray) in "The Great Gate of Kiev."

In Gaines' work, walking is the major motif of part one. Jane had decided to look for the Union soldier Brown who gave her the name Jane. She knows that freedom is in Brown's Ohio, and now calling herself Jane Brown she sets out to go there. After Big Laura is killed by the "Secesh" as they are walking to freedom, she takes Laura's little son, Ned, by the hand and "started walking again. We walked, and walked, and walked, and walked" (19). Later, "Soon as we lost sight of town we took to the bushes.... We walked, we walked, we walked" (39), "By the time I had rested, my dress had dried out, and we started walking again" (46), "Me and this little fellow here ain't been doing nothing but walking and walking and walking ever since we heard of our freedom. Any of them out there can do more walking than that I like to see them" (59).

At the end of part one Jane has walked for days but remains in Louisiana, and it is then that she decides to take a job clearing land for Mr. Bone. Her freedom will not come in Ohio, but her walk to triumph has just begun.

At the end of the novel she decides finally to walk for Jimmy who organizes a civil rights demonstration. Jane joins reluctantly but once standing and walking again, she cannot be dissuaded. She becomes in fact their leader. She says, "the number of people I saw coming toward me was something I never would 'a' dreamed of. I wouldn't 'a' believed nobody if he had told me this could happen. I stood there thinking: Jimmy, Jimmy, Jimmy, Jimmy, Jimmy. Look what you've done. Look what you've done. Look what you've done, Jimmy" (244). Miss Jane's incantation brings the novel to an end with "precession, bells, and chanting" just as assuredly as the closing sounds of "The Great Gate of Kiev." It is a great gate that Jane opens when she passed the landowner in the closing words of the novel: "Me and Robert, looked at each other there a long time, then I went by him" (246)

The rhythms and structure of this literary work have a musical connection. That much seems clear to me. It is finally and essentially unimportant to have to know how conscious the influence of one great artist is on another. What is perhaps more important to people in the humanities is that everything animate or inanimate, intelligible or unintelligible sends messages to every other thing that comes into its field. And it is in that respect that the influence of Mussorgsky's "Pictures" on Gaines' *Jane Pittman* might best be viewed.

3. A Folklore Perspective

Eric L. Montenyohl

Trying to describe the folklore element in the humanities in general, and Ernest J. Gaines's *The Autobiography of Miss Jane Pittman* in particular, is no small task. And yet it is precisely what the humanities and Gaines' book are all about. Folklore is not just important to both--it is central to both. Yet trying to deal with folklore is replete with difficulties. One of the first problems, and indeed the chief one, in working with folklore is the concept of "folklore." After all, in general few students have had a course in folklore before, so the term (in a scholarly sense) is new and different. What is folklore? This certainly is a key question, for how one conceives of it determines whether others, including students, grasp the significance of folklore in the humanities.

Folklore has been variously defined over the approximately 150 years since the word was first coined in England. When W. J. Thoms first created the word in 1846 he suggested it to replace the terms "Popular Antiquities" or "Popular Literature," to mean "the Lore of the People": the manners, customs, observances, superstitions, ballads, proverbs, etc. of olden times. When the study of folklore came to America, the first editor of the *Journal of American Folklore*, W. W. Newell, followed in Thoms's steps by identifying folklore as belonging to "the folk," and specifying that the folk included American Indians, Afro-Americans, French-speaking peoples, remnants of English settlers, and other groups. In today's jargon, he identified marginal groups who tended to be isolated geographically. Much of the work done by American and European collectors followed this conception of folklore until about the 1960s. In the 1960s and 1970s a number of new definitions for folklore were offered, including Jan Harold Brunvand's "those materials in culture that circulate traditionally among members of any group in different versions." Dan Ben-Amos led scholars to new perceptions by suggestion that folklore was "artistic communication in small groups." At nearly the same time, Roger Abrahams suggested that folklore was "all conventional devices available for performance and the achievement of performer status within a socially bounded group." Alan Dundes tried to define folklore by listing things, including "myths, legends, folktales, jokes, proverbs, riddles, chants, charms, blessings, curses, oaths, insults, retorts, ..." All of these definitions led another folklorist, Barre Toelken, to suggest that perhaps folklore "is made up of those things that folklorists care to talk about."

What then *is* folklore? It is all of these things and more. Folklore, after all, is transmitted informally (usually face-to-face, and not in formal instruction) and is learned by imitation. It demonstrates variation and stability at the same time. It can include everything from verbal forms (riddles, jokes, tales, myths) to material forms (quilts, house types, baskets, or dress form), from performing forms (dance, song, drama, and music) to social forms (festivals and celebrations, games).

What does folklore have to do with the humanities in general, and Ernest Gaines's *The Autobiography of Miss Jane Pittman* in particular? First, one

1254

could certainly read the book to find, isolate, and catalog particular speech forms and other familiar forms of folklore. For example, the account of Jane's visit to the hoodoo in order to deal with Joe's devil-horse is a classic example of folklore and its importance. Yet the study and use of folklore should *not* be approached merely as an exercise in identification and cataloging, for folklore is not limited only to familiar forms (jokes, ballads, tales, and legends). Nor is folklore something which is quaint, old-fashioned, or irrelevent. What is significant about folklore in action, and as it is represented in *Miss Jane Pittman*, is that it deals with human interactions and the rules for them.

Human behavior, the easiest example of which is speech, is rule-governed. Individuals don't learn the rules or terms formally--but instead learn them informally, by imitation--as folklore. One of the best examples of this in our lives and in the novel as well is that human are continually defining themselves based upon observable traits in specific situations. From that information are drawn conclusions about the individual as well as the groups to which he or she belongs: family, social, gender, ethnic, economic, community, occupational, regional, racial, etc. That is, an individual is not just an individual, but a representative also of particular groups, and must deal with the expectations based on those associations as well. Thus any individual in culture carries a lot of "baggage" around: (1) ones own group identities, which may shift according to the situation and audience; (2) the expectations of others, based on their own experience and identities; and even (3) the knowledge of and a response to the expectations of others.

In the novel, Jane too defines herself. Indeed the bulk of the book is her own personal narrative. In the story, the reader sees how Jane sees herself and how she changes over time. For example, early in the novel, Jane joins a group of freed slaves walking north and saves herself and Ned from an attack by slave patrollers. The next chapter, "Heading South," tells of Jane's meeting with a white lady with two girls and their ex-slaves who are returning south to their plantation. The following chapters, "Shelter for a Night" and "All Kinds of People," tell of Jane's encounter with a children's shelter established by the Freedman's Bureau. In both circumstances, Jane is viewed as a little black girl with no concept of distance (she in on her way to Ohio), no education, and few material goods, who is leading a smaller black boy carrying two rocks. Whites and blacks alike view her as female, child, black, destitute. And objectively she may be. But Jane's narrative (recounted decades later) points out that she saw herself very differently. She was female, but she was not helpless, and she did not feel a need for someone to care for her. She was young, but not immature, childish, or foolish. She was black, but she was also sure that she was free, and therefore no longer subservient to anyone. And her poverty meant that she had little to pack and carry on her travels.

Jane knows how to define herself, but she has had little experience with the wider world and with other people. Without that experience she shows that she knows relatively little about the expectations of others and how to deal with them. Both encounters with whites (the white lady on the road, the white minister in the children's shelter) generate verbal warnings that she is violating cultural protocols: she is addressing the whites as their equal. First Nicodemus, another black, warns her several times "You mind how you talk about white folks" (29). Later, the white minister accedes to her orders to warn the other boy, Claiborne, not to try to steal Ned's rocks, but then responds "And you, Miss Smarty, you better watch your tongue" (37). As she grows and matures, some of the most important things she learns (via folklore) are these cultural protocols: the expectations she has for herself as well as those others have for her. She learns more about her own identity. And she learns about the limitations which those others have put on her.

Jane demonstrates her mature knowledge in the story of Tee Bob and Mary Agnes (approximately pp. 136-193). The first episode, the account of Timmy's prank on Miss Jane, concludes with very different perceptions by Mr. Robert and Miss Amma Dean, all picked up by the narrator, Miss Jane. To Miss Amma Dean, the prank violates the code of behavior between races:

"He was looking 'cross the yard at the big house. From the way he was sitting in that saddle, not slumped over like a nigger ought to be, but with them shoulder up, with that straw hat cocked a little over his eyes, he was telling us Robert wasn't go'n do him a thing. But he didn't have to tell it to me. I knowed all the time Robert wouldn't do him nothing. But Miss Amma Dean still didn't know. Had been married to Robert ten, twelve years, and still didn't know what he would do" (142).

To Mr. Robert, however, the prank was merely a manifestation of Timmy's mischievousness and spirit--and, after all Timmy was his own son. Race was not involved at all in his view. In Miss Jane's words:

[Mr. Robert] "didn't say a word to Timmy. He knowed Timmy respected Miss Amma Dean. He knowed Timmy had to respect Miss Amma Dean just like he had to respect every white lady or white man. The other thing didn't matter" (142-3).

When Timmy has a run-in with Tom Joe, however, Robert has to face the problem in terms of race too. Jane recalls: "Robert came home later that night and Miss Amma Dean told him what happened. Tom Joe ought to be run off the place; no, put in jail. Robert told her he wasn't go'n do either. You pinned medals on a white man when he beat a nigger for drawing back his hand. 'Even a half nigger?' Miss Amma Dean said. 'There ain't no such thing as a half nigger.' Robert said" (144).

Robert sends Timmy away, and Tee Bob cannot understand:

"Tee Bob wanted Timmy. Timmy was his brother, and he wanted his brother there with him. He used to come back there in that kitchen every day and talk about Timmy. He could understand why Timmy had to saddle his horse, he could understand why Timmy had to ride behind him; but he couldn't understand why Timmy had to leave home after a white man had beat him with a stick. I told him Timmy had to leave for his own safety. But he didn't understand what I was saying. I told Miss Amma Dean to try to explain it to him. Then his uncle Clarence tried. After Clarence, his parrain, Jules Raynard, in Bayonne, tried to explain it to him. All of us tried except Robert. Robert thought he didn't have to tell Tee Bob about these things. They was part of life, like the sun and the rain was part of life, and Tee Bob would learn them for himself when he got older. But Tee Bob never did. He killed himself before he learned how he was supposed to live in this world" (144-45).

When Tee Bob falls in love with Mary Agnes LeFabre he shows that he has not learned the cultural protocols--and Jane, in describing the events, demonstrates her mastery of them. First, Jane describes Mary Agnes as "come from a long line of Creoles back there in New Orleans. Her grandmother was one drop from being white herself. Her grandmother had been one of these ladies for white men. They used to give these great balls before the war, and the white men used to go there to choose their colored women. They didn't marry these women, but sometime they kept them the rest of their life" (155-56). Eventually, Tee Bob finds that he must confide in someone about his love for Mary Agnes, and he picks his friend Jimmy Caya. When Tee Bob tells him, he also points out "I never told this to nobody else. Not even her. I'm telling it to you because you're my friend." Jimmy responds with "I'm not that good a friend."

Jimmy points out the Southern legal definition of blackness: "Don't you know who you are? Don't you know what she is? Don't you know these things yet? At the university, and you don't know these things yet? That woman is a nigger, Robert. A nigger. She just look white. But Africa is in her veins, and that make her a nigger, Robert" (170-71). Jimmy forces Tee Bob to face the situation squarely, and when Tee Bob speaks to Mary Agnes of his love she points out that Jimmy is right and asks him to leave. He does, but only to go up to the house and commit suicide.

After Tee Bob's death, Jules Raynard, Tee Bob's godfather, explains to Miss Jane:

"Somewhere in the past, Jane," he said. "Way, way back, men like Robert could love women like Mary Agnes. But somewhere along the way somebody wrote a new set of rules condemning all that. I had to live by them, Robert at that house now had to live by them, and Clarence Caya had to live by them. Clarence Caya told Jimmy to live by them, and Jimmy obeyed. But Tee Bob couldn't obey. That's why we got rid of him. All us. Me, you, the girl--all us" (191).

Significantly, Jules says this while driving Miss Jane back down to her house in the quarters--he in the front seat, and she, by custom, in the back seat.

Tee Bob dies, but Miss Jane lives on to tell the story. She has learned the protocols of her culture and is able to interact with black, white, and Cajun alike. Yet the story is not over, for Miss Jane Pittman has learned one more thing about cultural protocols--they are not natural laws, they are human ex-

1257

pressions. Because of this, they can change. The culmination of the book is Miss Jane's departure from the quarters to go to Bayonne for a civil rights demonstration. The aging Miss Jane sees that the time was right once again to question the "rules" defining the relationships between races. And for the first time since her youth she challenges a white person (Robert) as an equal.

What is the significance of folklore in *The Autobiography of Miss Jane Pittman*? There are many items of folklore represented within the text, so generalizing may be impossible. But perhaps the most important use deals with the "rules" or protocols dealing with interracial behavior. Miss Jane learns them, and learns to abide within them for most of her life. She sees Tee Bob crushed when he wishes to violate them. She has seen Ned killed when he challenged the expectations for blacks (organizing, education). And she lives to see Jimmy killed because he too challenged the rules (organizing, civil rights). All of these protocols--in the book and in real life--are folklore: traditional, with variation and stability, and passed around informally. In effect, the entire novel centers around the impact of folklore on human lives.

What is the significance of folklore in the humanities? There is no greater issue in the humanities than that of human and cultural values. What happens when we interact with other people? How do we behave, and what does this say about us? Ernest Gaines may not be a trained philosopher, folklorist, anthropologist, or sociologist--but he is a skilled observer and outstanding storyteller. *The Autobiography of Miss Jane Pittman* deals with human values as manifest in the unwritten protocols understood by different races and groups in the South. The book provides an outstanding case study for considering folklore as one expression, and a particularly significant one, of human behavior.

REDEFINING HUMANITIES: A SKILLS-BASED B.A. PROGRAMME

EDITORIAL NOTE: Americans may experience a shock of self-recognition in the first part of the following article, for the account of the current state of public education in the humanities in the United Kingdom reminds us that education is always in a political arena. Although the educational systems are quite different, the effects of the conservative educational policies of Prime Minister Thatcher and President Reagan have similarities. In Great Britain, however, there is a longer and more highly charged historic debate about whether humanities subjects are appropriate for all, or whether the majority of the population require only vocational training. The first part of the article sets forth the current political and social context for humanities education in Great Britain, while the second half describes an innovative and carefully designed sequential degree program in interdisciplinary humanities that would be unique in the U.S. and might be termed revolutionary in the U.K.

A decade of defensiveness should be brought to an end. It has never been the case that the development from 'elite' to 'mass' higher education undermined the relevance of the humanities: yet the pressure to self-justify in an increasingly unfavourable environment has left humanities teachers in a state of considerable anxiety about the relevance of their work, let alone the security of their positions. This anxiety is no less palpable for its incongruity. Allan Bloom notwithstanding, this discomfort has been felt particularly acutely in the United Kingdom, where enforced reductions of provision in higher education, the marketization of knowledge and the devaluing of the humanities in favour of narrowly 'vocational' courses have characterized the political ideology of the last ten years.

The very idea of a non-elitist humanities education is under ever-increasing attack as irrelevant to the economic needs of a modern society: it has become the conventional wisdom to be at least sceptical of the value of educational experiences that serve no explicit purpose by way of direct preparation for employment. The nature and direction of this attack should not be misunderstood, however. It is not the contemporary mood openly to oppose the teaching of history, literature, comparative religions and cultures, or philosophy. These all have their place in universities, polytechnics and colleges: but it should be comparatively cheap; sufficiently dusty so as not to interest any by the few; and thus effectively relegated to a minor role. In effect, this translates into a structural reallocation of educational provision either through governmental edict and/or budgetary control (recently further centralized in the UK by an administration zealously liberal in pronouncement and equally zealously authoritarian in practice) or more subtly through institutional and other pressure on humanities courses to reflect changing perceptions of appropriateness in an evolving market-oriented view of the proper role of education. Even the obvious contradiction marked by the fact that increasing numbers of those customers whom it is apparently the intention of the UK government to attract into higher education, namely older people who do not come direct from school, actually *wish* to follow humanities courses, appears not to have given the free-marketeers much pause for thought. They are merely attempting to rig the market by raising tuition fees, so as simply to change what people want to do by seeking to make courses which employers do not wish directly to subsidise too expensive for all but a leisured elite. Whether or not they will eventually succeed with this policy remains to be seen. Meantime, however, the effect is to devalue and undermine the teaching of the humanities outside rarified centres of academic inquiry (and even Oxford and Cambridge have felt the chill) or to reduce such work to contextual supplements occasionally to be added on to the serious vocational and otherwise specialisedly employment-oriented courses which institutions of higher education are being enjoined to mount to the preferred eventual exclusion of all others. The integrity of course design is compromised by relating the process to perceived market requirements (the ideological inroads of the Government's Training Agency's "Enterprise Initiative" is the most obvious example) rather than to recognizably intellectual criteria of excellence, coherence and appropriateness. A crude and almost unbelievably archaic functionalism with respect to the relationship between education and the economy has come to be sanctioned even by some of those from whom one would hope for integrity. How is this process to be understood and resisted?

In analyzing the growth and transformation of higher education in the latter half of the twentieth century, reference to the changing labour requirements of advanced and industrializing societies is an unavoidable and entirely apposite starting-point. While this functional relationship is neither exhaustive of the role of education, nor a sufficient explanation of it, its position as a starting-point does, however, protect us against the illusion that the policy-makers of the 1960s and '70s were motivated by some sort of conversion to the educational idealists' vision of "Higher Education for all!" as an end in itself (see Roderick, G. E. & Stephens, M.). It might further protect us from the beguiling fantasy that liberalism in its educational garb was anything more than a fitting decoration for that less comforting battle-dress of social and economic libertarianism that clothes the new crusaders for market forces and freedoms. Such a fantasy ought, of course, to have been irrecoverably exploded by the collapse of the egalitarian idealism that informed the reformist consensus of educational sociology so familiar twenty years ago: but nostalgia, especially of the pyrrhic kind, appears unhappily to spring eternal in the liberal breast. Yet of course even apparent utopias of infinitely flexible social mobility and intellectual egalitarianism such as the Robbins Report in the UK—naively hailed by many then, and still naively recalled by some now, as advocacy of education, if not for its own sake, then at least for the benefit of all - were clearly predicated on, and saw themselves as further serving, economic needs. (Such a view does not commit us to reducing the highly complex relationship between an educational sector and an economic system simply to labour-force requirements: much less to seeing the functional relationship as unproblematic, uncontradictory or self-sustaining. It implies, rather, that although the political culture of society plays a major part through educational policy in shaping the form of educational provision, it is not explanatory in itself, nor even if treated on an equal footing with the economic needs of society. The relationship is certainly not one-way, but neither is such a mutual dependence an equal one. As against Bourdieu [1977] and Hall [1981], although creating an order of society around fundamental economic relationships is just as much a necessary matter as production itself, the particular form of that order is not. While a number of social forms consistent with production needs are possible, an inconsistent form cannot survive indefinitely since production itself cannot be sustained by it.)

It is in fact hard to see how any coherent defence of the self-justifying notion of "education for its own sake" could be mounted outside of any specific social and economic context. Even something regarded as quintessentially a personal value, such as broadening one's intellectual horizons for the sheer fun of it, and encountering wider intellectual horizons for the sheer fun of it, and encountering wider intellectual challenges for the good of one's spirit, are after all as highly regarded as they are—and rightly so--not because they make possible the boast that one has read Tolstoy or conjectured at Popper's invitation, but because of the purchase such experiences and understanding enable one to gain on one's social, economic and historical circumstances. In terms of the structural and constitutional parameters of learning and inquiry a similar rationale holds. Constitutional protection for, and the advocacy and financing of, dispassionate inquiry were never social and historical acts of generosity inspired by ethereal moralism: rather they were, and we would argue remain, a necessary aspect of the reproductive requirements of a modern society.

It is in this context that the development of humanities programmes which might steer a passage between the irresponsibility of the liberal illusion of "education for its own sake" on the one hand, and a capitulation to the pressures of economistic libertarianism on the other, must be approached.

Humanities and the Contemporary World

All teaching programmes are intended to facilitate acquisition of both knowledge and skills. Traditionally these have been categorized as primary, discipline-specific skills; and the second-order, general learning and communicative skills implicit in any pedagogy. Humanities programmes have been no exception. In addition to an understanding of the conditions of human existence and the problems of conceptualizing and theorizing those conditions and their development, students in the humanities have always been expected to train in the analysis of complex issues; identifying the core of problems, distinguishing what is relevant to their possible solution from what is not, and suggesting appropriate means whereby such solutions may be sought; integrating and synthesizing disparate elements across broader problematics; making effective use of a range of information; identifying, clarifying and often challenging values; and communicating as clearly as possible. In a world increasingly characterized by organizational, procedural, political and technological change, it is precisely these second-order skills which acquire particular value, and which constitute part of the expanding set of transferable intellectual skills whose importance has come increasingly to be recognized, even if all too often at the cost of their being conflated with the ideological objectives of, for example, advocates of "enterprise" in higher education.

We are not seeking to suggest that these skills are the sole prerogative of the humanities, but rather that courses in this area ought to be as well placed as any, and often better than most, to offer a structural and pedagogic lead. Clearly it is not possible to put the sort of emphasis on skills which we suggest without considerably revising traditional humanities courses—but it is precisely in the humanities that the need for such revision is most obvious and pressing if they are to fulfil the role we would wish to claim for them, namely that of serving to empower the widest possible range of people to deal with the society and circumstances in which they find themselves and, thereby, serving the needs, economic and otherwise, of that society rather than some one power within it. It is not that the second-order skills traditionally associated with the humanities exhaust the range of transferable intellectual skills, but that some even very obvious extensions (for instance self-criticism, group-work and group criticism) lend themselves particularly well to a setting within the humanities. Least of all is it the case that the sort of changes envisaged should be treated as unwelcome, although perhaps necessary, intereference with the teaching of the humanities: rather they propel a revision of both structure and content which enhances learning and which serves to stimulate exactly that critical thinking which teachers in the humanities have always advocated but all too rarely actually promoted.

It might reasonably be asked, of course, whether such a description and justification of the changes advocated might not merely constitute a smokescreen to disguise a supine and unprincipled surrender of academic independence in the face of pressure to conform to contingent educational and economic circumstances and a crudely pragmatic way of attempting to deal with the naively libertarian ideology with which we are faced in higher education. Is the kind of degree programme suggested a safe political compromise, a design framed with a view to finding comparative safety from the demands of contemporary capitalism? Is it in consequence unredeemably callow?

Such questions are pertinent, proper and entirely understandable. Whatever the intentions of the Department which is the collective author of the degree outlined below, our conviction that it constitutes neither surrender to prevailing political ideology nor even any sort of compromise beyond the limits always and necessarily set by the fact of working within a structure whose nature is ultimately determined by the state remains to be tested by the students who take it. Nevertheless, the view that it is a set of traditionally determined organisations of content, the internal concerns and constraints of which can uniquely constitute a proper course of higher education, and which alone must supply both the rationale and the parameters of students' learning experiences, is clearly inadequate. Among other things, it is precisely the prevalence of such a view which is in good part responsible for the inherent weaknesses of British higher education: for it is on the on the back of such an elitist liberalism that the current philistinely anti-educational libertarian ideology in pursuit of which the public provision of education is being attacked is able to make the considerable headway that it has. Why should anyone outside academe wish to defend an education which prepares a select few to join an elite club? Even if explicit attention to skills does not constitute the whole of what higher education needs to be about, it is at least part of that story: not only in helping to equip students for employment, but, more importantly, in empowering them as citizens.

All that said, course content remains governed by the normally accepted and entirely proper academic criteria of rigour and honesty. The developments in respect of learning and teaching strategies and in the structure of the degree as a whole, moreover, are ones which are specifically and explicitly concerned to promote just those skills in students which the humanities have long claimed as a particular prerogative. The aims of the degree therefore remain those at least implicit--and only implicitly achieved--in more traditional models: the development of a critical awareness and understanding of the genesis, character and implications of a particular set of issues, in this example issues centrally concerned with the contemporary world. The emphasis on transferable intellectual skills constitutes the development of what might be termed a cultural armoury, one which has application in innumerable contexts, whether for apology or critique.

It is perhaps a peculiar irony of the situation in which we find ourselves that such changes in higher education, which are of particular interest to industry, commerce and business in a capitalist society, would also be seen as potentially subversive of it by critics of the prevailing socio-economic system: and a parallel irony would in all likelihood underlie debates arising from a proposed introduction of a similar skills-based programme within, for example, a system predicated on socialism rather than capitalism. In both cases, it is the emphasis on teaching people rather than courses and the resultant concordance between economic objectives and those of education which gives rise to doubts. To the extent that both these are indeed ironies, the welcome view suggests itself that there are techniques of critical appraisal and knowledge acquisition which can be evaluated independently of their theoretical perspective or of the nature and objectives of the particular context of application. Such an avowedly non-relativistic view of the nature and value of education is perhaps unfashionable: but nevertheless, if it is rejected, then on what grounds can, for example, advocates of the elitist "learning by osmosis" view of what a humanities programme should look like *argue* against those who would see its abolition in favour of narrowly vocational courses only?

These are the central theses that have inspired the development of the new BA Humanities at Brighton Polytechnic. Doubtless none of its features is unique: as an integrated programme, however, we suspect that it constitutes a distinctive and experimental course which is at present unique. If it is to succeed, it will require considerable peer criticism, constant evaluation by its students and by its potential students, and a good deal of consequent revision. It is at least partly to this end that we outline it below, as well as to stimulate debate on the contemporary direction and role of work in the humanities.

THE BA HUMANITIES AT BRIGHTON POLYTECHNIC

The key features of the degree are these:

1. a multidisciplinary approach to thematic areas;

2. a considerable reappraisal of the content of "humanities";

3. pedagogies explictly oriented towards students' acquiring transferable intellectual skills;

4. an admissions policy geared towards the achievement of a social balance;

5. continuous and final assessment of both written and oral work;

6. both individual and group project work;

7. a highly developmental, rather than a modular, structure; and

8. IT components integrated into course-specific applications.

The OBJECTIVES of the degree may be summarized in the following terms. The founding conviction of the degree is that it should emphasize underlying intellectual principles rather than attempting to provide one or several branches of specialist knowledge. This must imply the *explicit* training of students in the development of a range of skills that may be divided, broadly, into three inter-related categories: the particular skills integral to the humanities disciplines represented within the department and their necessary contemporary extension; those associated with the application to issues and problematics of a number of disciplinary approaches and their comparison and critique, leading to a synthetically multidisciplinary appreciation of the matters concerned; and the skills of analysis, synthesis, identification of relevant information and presentation and communication of findings which are readily transferable from an academic context to the rest of the world. In brief, it seeks to locate the concerns and methods of the humanities within a cultural context characterized by scientific and technological development, and by an increasing recognition of the importance of the learner: it constitutes one facet of current attempts to develop what has been termed a "logic of the humanities."

Students who successfully complete such a programme should be well prepared to meet the challenges of a complex and rapidly changing world.

They will be equipped to engage in a critical evaluation of problems, and to approach job-specific training or professional courses, whether vocationally or academically oriented, with the confidence of those who know how to learn, how to set about discovering and integrating new information, and how to refine their crafts. They should be in a position to engage both in serial retraining for work and in continual political and cultural reassessments.

In terms of STRUCTURE, the degree is designed to achieve its overall objectives by means of a systematic progression that emphasizes the acquisition and practice of written and oral skills, analytical ability, and self-motivation and resilience. The choices available in Parts Two and Three afford considerable flexibility in respect both of content and the range of skills involved: students are thus enabled to develop their particular academic interests and strengths; their preferred modes of working; and specific specialized skills.

The three-year programme is structured as follows.

PART ONE provides a broad range of the methodological approaches of late twentieth century humanities disciplines. It consists of seven one-term (12 week) courses:

Philosophical Analysis

Natural and Social Scientific Method (a long overdue extension of 'humanities')

Historical Inquiry

Geographical Inquiry

Ideas, Religions and Culture

Word and Image: Reading Strategies

IT (an introduction to hardware, software, and basic questions about the social implications of IT).

All courses are compulsory, so as to ensure that every student has the broad base necessary successfully to pursue an integrated multidisciplinary humanities degree; to facilitate an informed and open choice of Part Two options (see below); and, through exposure to unfamiliar methodologies, to help students begin to think reflectively and self-critically about their interests and learning processes. The problem of designing twelve-week methodological courses for students from a wide variety of backgrounds is approached by using case-study material that is common to parts of each of the three courses running in tandem where possible (e.g., towards the end of the first term, common material on problems of relativism services seminars in all of the first three courses listed above); by preparing carefully delineated and guided sets of reading material; and by building a group self-reliance fostered by stable seminar groups throughout the whole of the first two terms. The distinct approaches of the disciplines represented in Part One are drawn together by a line of over-arching lectures from guest and staff speakers dealing with a range of contemporary issues.

PART TWO consists of nine two-term courses from which students choose three. They express the key teaching and research interests of staff, grouped around what are arguably central issues of the contemporary world: as such they are of course liable to change. At the moment, the nine themes on offer are:

The British State

Culture and Criticism

The Environment

From Magic to Mars

Modern World Studies

Multicultural Studies

North & South

Self and Society

Spatial Inequality and Development

These courses serve to introduce students to multidisciplinary work, using the methodologies to which they were exposed in Part One. At the same time, they are required to confront more demanding seminar and written work, taking greater responsibility in terms of, for instance, chairing discussions and submitting work. Finally, they begin in Part Two to focus their interests on specialist areas for intensive Part Three courses.

In PART THREE, students choose two more specialized courses--each running for four terms--from those emerging from two of their Part Two choices. These courses deal with material in considerable detail, requiring an increasingly intensive commitment and sophistication as they develop from one-third of the way through a student's second year to the end of their programme. Although always emerging from the thematic courses of Part Two, they vary from year to year, in accordance with the developing interests of staff, their availability, and, where possible, the particular interests and concerns of the student cohort concerned. This developmental specialization allows not only for concentration, but also time for the initiation and completion of the Project that constitutes the third strand of Part Three.

This takes the form of either a dissertation, an independent study, or a group project, defined below. Having followed a preparatory course in term 5, involving research methods, writing and speaking skills, audiovisual work, etc., students start their research in term 6, submitting the project in their final term. Its constituting a substantial part of the whole degree, being a central indicator, as well as focus for the development, of students' academic abilities, is reflected in its carrying 20% of the total of the final award. It also forms the basis for the final oral examination, which carries a further 10%.

A *dissertation* is a substantial piece of individual research work, often based on primary sources or first-hand inquiry, which enables students to demonstrate their capacity to plan, undertake and complete a sustained study of a particular topic related to elements of the courses they have followed.

An *independent study* is a project which encourages students to demonstrate initiative in the individual treatment of problems emphasizing the relation of academic skills to the wider world, together with explicit reflection on the learning process itself. It issues in either a substantial piece of written work or written work together with audio and/or visual presentation. It is distinguished from the dissertation in the dual demands that it apply skills learnt directly to the wider world and that students set their own objectives in terms of which the project is awarded a mark, which therefore reflects in considerable measure the quality of the assessment of the learning process undergone.

A *group assignment* is a project of either sort outlined above undertaken jointly by a group of at least two and not more than five students which places particular emphasis upon the work-related skills involved in collaborative investigation. The co-operative nature of this form of project clearly distinguishes it from the two wholly individual varieties. It is assessed on the basis of group participation and initiative, a joint report or other outcome, and the structured and identifiable individual contributions of participants.

Consideration of TEACHING AND LEARNING METHODS is of course central. It was, after all, a recognition of the need to reassess our pedagogy that contributed in no small measure to the decision to lay explicit emphasis on students' skills. The result is the embryonic elaboration of the pedagogic purposes of the two central ways in which students actively learn, namely orally and in writing. The former is represented largely by seminars, and the latter by course essays, reports, reviews, and the project, for all of which tutorials, lectures and practical work of various sorts function as supports.

Given the reality of constraints on staffing, therefore, this implies fewer meetings than would be possible in larger-scale situations, commensurately reducing contact time per student.

Seminars are discussion groups (of 8 - 10 students) in which theory and data are collectively explored, ideas elaborated and tested, and the impetus of the respective courses maintained and stimulated. They are organized on the basis of presentations by one or more students, and range from workshop format to formal presentation of papers, with students playing increasingly central chairing, structuring and organizational roles from Part One onwards.

The function and nature of seminar work has been the subject of much departmental discussion stemming from the tensions commonly perceived in higher education between the clear educational importance of small group discussion and their all too commonly desultory nature. The outcome has been a commitment to a programme of staff development in this area, with the aim of raising and maintaining the quality of the work described above. The introduction of oral assessment, covering both seminar performance (coursework) and a final examination (on the project) will doubtless be an important factor in seminar development.

1268

Tutorials on marked written assignments (initially in groups of three or four; then two; and in Part Three one-to-one) enable students and tutors to work together not only on the material concerned, but also on the identification of strengths and weaknesses in written work and the general ordering, articulation, defence and development of students' perceptions of it. The emphasis of tutorial work shifts progressively from analysis of the quality of written work in Part One and specific assistance with its improvement to the further development of, and debate about, the topic under consideration in Part Three.

Finally, *lectures* provide an efficient means of disseminating information, suggesting perspectives, making links not present in the established literature, drawing together various elements of the course, and, most importantly, stimulating interest and discussion. Their role, while prominent in Part One, diminishes as students progress into subsequent parts and the place of seminars becomes dominant.

These, then, are the key features of the BA Humanities at Brighton Polytechnic; their rationale; and their context. We are interested to hear from colleagues elsewhere how it compares with other current developments in the humanities, and whether in their view it can, or indeed should, succeed.

Further details of the BA Humanities program are available from the authors, at the Department of Humanities, Brighton Polytechnic, Falmer, Brighton, Sussex, UK.

CREATIVE WRITING: FROM THE BOMBSHELTER

Twelve students slump on the dusty wooden floor. One student keeps her face toward the wall. It is a small room, about 12 x 12, windowless. It is illuminated by fluorescent light.

It could be an over-crowded prison cell or some other horror of civilization, but it isn't. It's a classroom and the students are part of an experiment in teaching Creative Writing. They are spending their class time in a simulated bomb-shelter, using writing as a way to express the feelings and thoughts which the situation engenders.

Because I teach Creative Writing primarily to non-English majors, I have found it useful to engineer an environment which thrusts students rapidly into the less familiar parts of their psyche. This enables them to write poetry and short stories both quickly and in depth.

Over the years, I have experimented with several different themes, keeping the basic structure the same. The theme is the motif I hang the course around. I have used an island, a bombshelter, a farm, and am currently finalizing a class centered around homelessness.

Once the motif is selected, the structure almost defines itself. First, I find a classroom setting most reminiscent of the theme and devise a semester-long role-playing situation within the students build the class experience.

The "island" was a raised platform covered with green carpet. If anyone fell off or left, they were considered drowned or they were rescued by others. Drowning sometimes was a way for a student to indicate withdrawal from the course. The farm or "heartland" motif led us to spend many class periods at nearby farms, wandering fields and sitting in tumble down buildings. The "homeless" theme is especially interesting because it will be taught without a classroom--in train stations, church basements, even outdoors around a trash burner.

After theme and setting have been arranged, I equip us with the necessary props for the adventure. The bomb shelter had its lists of usual items found therein. For the island simulation, I made slips of paper containing items someone might grab if leaving a sinking ship (family album, bible, cigarettes, drugs, life belt, matches, etc.). Students each drew five slips and these became the only items used in simulated efforts at survival. Students also were allowed to keep any items they had with them on the first day of class. To understand the impact of this, ask yourself what you have in your purse, briefcase, wallet, or pockets right now that would be helpful in such desperate circumstances. For the homeless setting, students may keep what they have with them at the first class also--any other items needed later in the semester, such as warm clothing, must be borrowed or acquired from a charitable organization. The realism of our experience--lack of money, place, status, and possessions-- is the element which seems to make or break the creative endeavors.

At the first class, I lay out the ground rules: (a) no one may leave during class if not appropriate to the theme--they could be drowned or radioactivated, thus getting a "W." (b) Everyone writes a poem at the end of every class, including the instructor. (c) Everyone reads his/her poem at the beginning of the next class. (d) All poems are turned in to the instructor who critiques them in writing and returns them. (e) During the class time itself, the instructor will usually be just another member (except, of course, I do encourage certain developments and discourage others as seems appropriate to the course goals).

After the simulation is thoroughly explained and all questions answered, we begin. After some anger and confusion from students, I usually suggest we introduce ourselves since we're going to be stranded together, one way or another, for a long time. I invite students to tell what and whom they left behind. This simple invitation, coupled with the strangeness of circumstances, triggers surprising emotions. Students talk about family and friends, possessions, pets. Soon we are deep into the developing drama and I never know exactly what will happen next. Think for a minute how you would feel as a student in your first day of such a class. Perhaps you had hoped to learn sonnet form and the elements of a good plot. Perhaps you had simply hoped to catch up on your sleep. Each student enters with a different set of expectations, personality strengths and skills. All we have to make the class a success, we soon find out, is each other and our few props.

You may be thinking at this point: "Well, it's a good idea but how in the world do you sustain it for 15 weeks." Let me describe how a typical simulation evolves over the course of a semester. As you will see, ending it is often a bigger problem than sustaining it. It has been my experience that students get deeply involved in this class and it often becomes, not just another elective, but the most important class of their semester.

Here we go.

Week # 1--Setting the scene and ground-rules, fielding questions, familiarizing students with props and beginning role-playing. People sit awkwardly for a bit. Some may get up and wander around in curiosity, nervousness or disgust. Murmurs of protest may arise. After awhile, I or someone else points out that if we are to survive, we'd better do something. Sometimes I say, "IF we want to survive under these conditions, but perhaps we don't." Students think about the hassle of dropping and adding classes, of rearranging schedules; most of them decide to stay and begin to talk. Sometimes the focus becomes "survival," often a new question for students. They begin to wonder if they should hoard their own possessions or pool things for the good of all. **Week # 2**--Students begin to worry. How will they be graded? What if they don't like these people? What if they have to go to the bathroom? They may get a little claustrophobic and react self-protectively. Some may imagine ways to escape. Some go off and do homework in a corner. At about this point, someone usually remembers the game we're playing and thinks of one prop that I always include: guns.

As one student, John, suddenly realized in the "island" simulation, "What's to prevent someone just going berserk and shooting us all?" Other students protested. Who would do THAT? A heated argument ensued sounding remarkably similar to ones we hear surrounding any issue of gun control. Finally, students decided someone was going to have to be in charge of the guns. And THAT is a crucial issue because the question behind the question is: "Whom do we trust?"

People at this point may calm down and begin to talk seriously about how little they know each other and begin to frame their concept of trust. The poems in the second week are full of emotion students did not know they had. The whole point of the simulation is being realized at this time--people who are not usually in touch with their expressive sides have quickly become in touch. They have strong emotions about the subjects being role-played, and emotion is the stuff of poems.

About **Week # 4**, students have settled down and begun to have a little fun with the whole thing, when all of a sudden they discover they are bored. They aren't afraid of the room or each other any more, but what are they supposed to do during class time within the imposed constraints? They have already probably made schedules, assessed each other's survival skills, talked about their feelings ad nauseum and now they want action. The solution must come from the class. I don't provide it. Usually, it evolves as members put each other in charge of various aspects of the time. Somebody might volunteer to conduct a prayer service; someone might teach aerobics; some competitive games might be devised; someone might read out of a book to others; someone might propose a skit. Anything can happen. Two things almost always happen in the simulation as they do in real life with the advent of leisure time. Activity leaders begin to emerge and sex becomes an issue.

Week # 5 or 6 finds students discussing sex. This continues to one degree or another for the rest of the semester. They begin sometimes by an intellectual question as to whether they should "mate" or not. They wonder if people should be allowed to mate given the circumstances. If so, are there enough partners for everyone? (Obviously the "homeless" theme will move in a different direction at this time than the "island" or bombshelter" themes do.) What about birth control? Usually no one has any birth control device along that will meet everyone's needs. No birth control? Well, what about a baby then? Anybody want a baby? This raises other questions. Is there enough food? Who can birth a baby? What are the risks? Which women are willing? Will the baby belong to a couple, the woman, or to the whole community? The questions are exciting re-phrasings of questions humans have asked as far back as anyone can remember, and the answers are as diverse. Usually, students agree that the decision must be made by the whole community. The sex act itself then is recognized as a social act impacting on all, a new thought for most students. These discussions result in some very mature poetry. The issue is life itself and the development of community responsibility for life.

Somewhere around **Week # 8 or 9**, someone from the outside wittingly or unwittingly stumbles into the class area or knocks on the door (sometimes I arrange this; sometimes it just happens). What to do? To their amazement, the students typically panic and call for the guns. Then they wonder if they should open the door and be radioactivated? Should they welcome the intruder? Maybe it's someone offering help. The strength or weakness of the community is tested. Can the group survive? As one student put it, "I felt as if our amniotic fluid was being violated." The issue of us and them sometimes brings up racist or sexist attitudes. Can women be leaders? Aren't they too emotional? But, others argue, they're the only ones who know how to birth a baby, handle sickness, sew, make food out of limited rations. Suddenly, some of these "female" tasks become the most valued of all. Some of the men realize they are dependent on women for survival.

And what about blacks? On the island, we had one black male student. He expressed feelings of loneliness. Whites were astonished and supportive. Questions of inter-racial sex arose. Everyone was polite but no one wanted to bring up the heart of the matter--whether or not, Scott, the black male, could find a sex partner among the white females (theoretically, of course). The result in that case was interesting. Scott told the surprised women that he wasn't sure he was attracted to white females, while the white females found themselves very attracted to Scott. (I might add that Scott, a natural peacemaker, was the person who had been entrusted with the weapons.) The frank discussions and eventual decisions in this case made all members feel very united, proud, even tearful. These feelings were expressed in poetry.

And so the course winds toward the end. About **Week # 11** I remind students that our time in the class is nearing an end. We begin to prepare for separation. At this point, I ask students to write a short story based on their experiences. These are read aloud.

We use the last three or four weeks to compile a book of our adventure. The book includes our best poetry and short stories in the sequence in which they happened. Narration fills the gaps in the tale and we eventually publish a memorable, unique, creative book which each member can keep. The book eases the separation.

We end with a celebration and group efforts to sell the book to the larger Nazareth College community. This joint outreach complete the transition back and helps us share with others the impact of the dramatic, if imaginary, experience we have lived.

As an addendum: these books are greeted with curiosity and enthusiasm on campus. Usually, the mystery of Creative Writing class has already been the source of much conjecture on our small campus. Often, the publication surprises the community by its quality. One academic dean said, "I have never seen such an excellent student literary publication. How did you do it? Who are these students?"

His question remains a good one. This unusual method of "teaching" Creative Writing has never failed to produce exciting, visible results. One might well wonder "who are these students?" Every semester, it is different, but since we have a small English major, they are seldom majors. To take one class as an example--the students that year were:

--Patrick, an Education major who never had written a poem before entering the class;

--Ann, a Social Work student who equated descriptive adjectives and flowery language with poetry (and who was very shy);

--Dave, a Business major who worked full-time on the line at Fisher Body and thought the class was crazy until he found out the other students cared about him enough to change the class time when he got put on another shift (Dave also disliked blacks and mistrusted women but ended up writing his best poem about women as leaders);

--Scott, a Business major and athlete, black (Scott goes down in history as the only athlete I've ever know who gave up the baseball team because it conflicted with the class);

--Joyce, a Social Work major who had never written a poem;

--John, a Pre-Law student with a fiery temper honed on the streets of Brooklyn, inclining him to be verbally abusive and hard to control at times (his best poem ended up being a ritualized prayer). Who are these students? Quite honestly, they and other members of each class have been random members of the Nazareth student body, usually taking the course because it fits into the right time slot or meets a distribution requirement.

The exciting thing about simulated experience as the source of creative writing is the result--I have found anyone can become more creative quickly in this format.

GREAT CLASSROOM HANDOUTS OF THE WESTERN WORLD II

Writing About Buildings

The only real problem with this assignment on "experiencing architecture" is that it is ungradeable! This was apparent when I first used it (how can you justifiably tell a student that he or she had a C-minus encounter with a building?), but I have continued to use it as the opening assignment in a humanities course on classicism. Enrolling 70 students each fall, the freshman-level course introduces classical tenets of *symmetry*, *order*, *propriety* and *decorum* in ancient and renaissance literature, arts and philosophy with emphasis on architecture and drama.

The assignment is designed to forestall and counteract the prevailing academic depiction of architecture in which all buildings seem to become two-dimensional pictures of unapproachable Great Monuments. There's plenty of that in the course, because by the end of the term I want the students to have a reasonably sophisticated technical vocabulary to describe and discuss words of architecture. They don't when they write this paper, so if you use it, be prepared to deal generously with *incredible*, *awesome*, *humble*, and vague descriptions of details. It is worthwhile though, for over the past five years I've had many students remark that they'd "never thought about a building before," "had not been aware of their feelings," "passed by the church every day without noticing," and for those who have traveled: "I wish I'd had something like this before I went to Europe."

This is adaptable for almost any level and many situations, but be forewarned that it does require careful preparation. I spend an hour explaining the five senses with verbal illustrations from my own experiences (such things as the aroma of department stores, the sounds of King's College Chapel, the tight spaces of Wright's *Wingspread*, strained muscles at *Sacre Coeur*--mixing homely and exotic examples). A couple years ago I did a freshman honors section with only twenty students, and we finished the term with teams of three or four students selecting a local building to study and present in a video format. This required an hour on cinema terminology, another for teaching, scripting, another of videocamera elements, time to grade first drafts and some time for students to work together. We had no equipment for editing (I wouldn't have wanted any at this level, because making it "in the can" requires thoughtful, careful preplanning) so the technical results were pretty bad, but as a sophisticated

1278

reprise of the "experiencing architecture" essay, the exercise was successful.

Sometimes I specify compositional structure (start with a thesis statement); other times I don't. It seems to me that this handout and accompanying lecture could also be used prior to a field trip.

Hum 1001

Writing Assignment #1

The purpose of this assignment is to heighten your awareness of "architectural experiences." In one or two typewritten double-space pages you are to describe how you encountered a building, how it affected you, what components contributed to the effect.

CHOICE OF SUBJECT. Select a building that is not familiar to you. It should be architect-designed-- that is, individual and not merely utilitarian.

(Many buildings are not individual, but are made from plans from books or magazines, or like many hotels and motels, are produced in multiple copies from a corporate master plan. Others are quite utilitarian, not designed for an architectural experience. Many office buildings are simply containers for offices; warehouses and factories do not have visitors in mind; most retail stores are planned for inexpensive alterations of interior decor.)

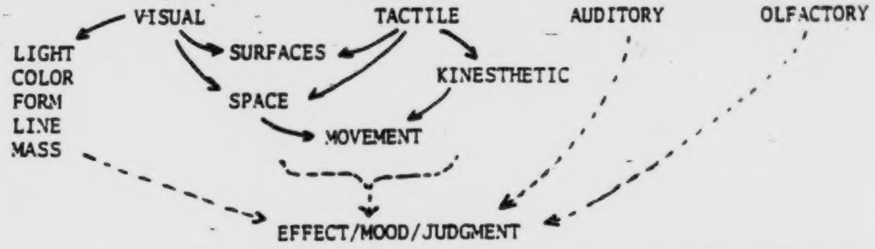
Ideally, your building should have been planned totally, that is, the designer planned both the interior and exterior with hope for permanence.

Therefore, churches and other public buildings are your best choices. Some of these, of course, have been built on a very limited budget and could not allow for any architectural "effects." But nearly all large religious buildings actually aim for an effect on the visitor. So do all shrines, most museums, all government (legislative, judicial and executive) centers (though not always bureaucratic buildings), many financial and corporate buildings, some schools, retail buildings, sports centers.

Some Duluth suggestions: City Hall, the new and old public libraries, The Depot, Grain Exchange, Greysolon Plaza (old Hotel Duluth). Most churches, but especially St. Paul's Episcopal, Holy Rosary , First United Methodist. Most of UMD is utilitarian, but architectural effects were intended in the Medical School, the School of Business and Economics, the Alworth Planetarium and the Marshall Performing Arts Center. Glensheen is a perfect example as a residence, but you must experience it as a member of a planned tour. The Twin Cities abounds in subjects, but the State Capitol and the Cathedral of St Paul in St Paul are particularly notable.

HOW TO "EXPERIENCE" A BUILDING. Start on the outside and walk in. The first time, do it as you might if you weren't doing an assignment -- except to be aware of how you are feeling. Then you might repeat the journey, jotting notes.

Of the five human senses, vision is most significant, while taste probably is irrelevant. Sound and smell are sometimes important. Feeling, especially in the feet and legs-- helped much by the eyes-- is always part of the experience.



e.g., oppressive, awesome, calming, cozy, inviting, reverent, unified, confusing, rich, cheap, irritating, dignified, alienating, etc.

Be sure your paper tells what place you are writing about. Proofread and correct legibly.

Don’t think about renewing too long!

You don’t want to miss the next two special issues on landscapes, cityscapes and humanities teaching, both of which will include color slides of art works.

GREAT CLASSROOM HANDOUTS OF THE WESTERN WORLD III

Writing About Philosophy to Improve Critical Skills

Having now taught philosophy for three years in New College, a non-traditional undergraduate degree-granting program, I have encountered certain problems which traditional faculty at our University generally do not have to deal with. One of these is the assessment of the student's progress with little personal contact and no examinations. In this program, which has approximately 900 students, all of courses are individualized tutorials where the professor meets each student six or seven times approximately one hour. During these sessions we discuss the assignments and related material. The majority of the readings are original works by contemporary philosophers. Most of the students have little difficulty in summarizing the material, but they encounter quite a bit of difficulty in discovering the major points and arguments. The problem for these students is not learning the content but learning how to think critically or philosophically. After several unsuccessful attempts at remedying this problem, I developed the following handout in an attempt to assist the student in thinking and writing critically. The first four paragraphs consist of an objective assessment of the author's work and the last two paragraphs are concerned strictly with the student's views concerning the article. Students must try to defend their positions by offering reasons or support for what they say. Some courses do not lend themselves to this type of approach, but for those that do, the students will write approximately 25 to 30 two page, typed critiques.

The primary focus of the assignment is to instill in the student an ability to think in a reasoned, reflective manner and to begin to understand the nature of argument. The goal of the writing assignments is not to get the student to arrive at the same thesis and arguments that I would, but rather it is to encourage them to penetrate to the heart of the essay and to arrive at their own interpretations and conclusions.

The major problem that I have discovered is that many students do not fully understand what an argument or even a thesis is. I have attempted to remedy this by placing on reserve in our library an essay on reading and writing philosophy, spending time in the first meeting discussing the assignment in depth, and making extensive comments on their initial attempts. Although they still find the assignments difficult, after the first or second meeting, most students understand what is required of them and do rather well.

Critical Review Procedure

The following is the procedure for writing critical reviews of a philosophy article. In this course you must follow this procedure unless otherwise noted on the syllabus. Assume the reader is a friend of yours and knows nothing about the subject matter. Your objective is to demonstrate to the reader the thesis and the salient features of this thesis. You have six paragraphs and only six paragraphs to achieve your objective.

1st paragraph	Clearly state the author's thesis or position for which she or he is arguing. You should be able to do this in no more than two or three sentences.
2nd paragraph	Give as much background information as you deem necessary to help the reader understand paragraphs one, three, and four. Sometimes this takes the form of definitions, assumptions, etc.
3rd paragraph	State and explain the strongest argument for the author's thesis. This paragraph must relate directly to the thesis; it is the author's defense of the thesis.
4th paragraph	State and explain the second strongest argument for the author's thesis. This

	paragraph must relate directly to the thesis; it is the author's defense of the thesis.
5th paragraph	State and explain some of the problems you see with the author's arguments, etc. Make sure you explain why these are problems with the article.
6th paragraph	Write a good ending stating your position and the defense of this position. Any opinions, assumptions, etc. must be supported.

Your essay will be graded on the basis of the following areas which are listed in order of importance:

A) How well you have analyzed the article (paragraphs one through four).

B) How well you have thought out and defended your thoughts in paragraphs five and six.

C) Grammar and mechanics

The essays must not exceed six paragraphs and also should not exceed two, double-spaced, typed pages. The essays must be in your own words. If you quote or paraphrase please note the page number.

CALL FOR PROPOSALS

KNOWLEDGE, VALUE, AND BELIEF: INTERDISCIPLINARY PERSPECTIVES

Sheraton Tara Inn in Manchester, New Hampshire
November 1-4, 1990

Sponsored by
The Association For Integrative Studies & Saint Anselm College

This conference will focus on the interdisciplinary nature and uses of fields traditionally identified as the humanities and their relations to knowledge, value, and belief. Papers may be submitted which discuss the role of value and belief in the construction of knowledge, their role as synthesizing or integrative forces, and the relationship between belief and scientific theory and practice. Papers on any other relevant topics are also welcome, including teaching the humanities, and interdisciplinary theory, methodology, and curriculum.

Please include name, address, and phone number, as well as the title and a one-page summary of the paper or session.
Submit by April 15, 1990 to:

T-MINUS 50

50 Hours. A Core Curriculum for College Students by Lynne V. Cheney. National Endowment for the Humanities, Washington D.C. 1989. Reviewed by Sharon Scholl

"Core curriculum", the current buzz word of academia, is a loaded term carrying with it an unease with specialization, radical individualism, and cafeteria style education. Bloom tells us we have lost coherence and settled for discrete, value-free knowledge pills. Hirsch tells us that cultural illiteracy is undermining our national cohesion and furnishes us with vast lists of what every American should know. Now along comes Lynne Cheney leading the charge of the National Endowment for the Humanities into the fray with a list of its own. The stated purpose of their exercise is to "encourage coherent and substantive learning in essential areas of knowledge."

What are essential areas of knowledge? Key facts, dates, formulae, grammar, and techniques are on the list, but equally so are concepts, rationale, arguments, and the expressions of value systems. Knowing how to recall and manipulate data cannot be decried, but neither is knowing why it is important to do so. Now, when these fact and value systems must be defined into areas of study, the NEH document becomes very traditional. Their idea of a core curriculum is an array of foreign language, mathematics, natural and social sciences, along with a catch-all labeled "cultures and civilizations." However, as though to undercut strictly disciplinary barriers, the Brooklyn College and Columbia University core curricula are detailed because of their interdisciplinary focus. (In actuality, Brooklyn's core is multidisciplinary, with only one integrated course.)

Those of us who teach Humanities courses based on the culture history model will recognize the 18 hour Cultures and Civilizations category as what we have been doing all along. It simply has a larger proportion of history, sociology, and economics materials, implying some team teaching arrangement. It attempts a global reference in the first course of the sequence, but classics of other cultures do not appear in succeeding course lists. As though to atone for this omission, the unit prescribes two courses in non-Western or Third World studies. The disciplinary representation is the same:

literature, art, music, religion, philosophy, over a detailed historical framework. The main twelve hour body of the Cultures and Civilizations unit is divided into four courses: world culture prior to the Greeks; Greek, Roman, Medieval and Renaissance periods; post-Renaissance through modern periods; and America from the Colonial Period to the present. Original historical, philosophical, literary, and artistic documents and artifacts are emphasized. The familiar listings (Aristotle, Mozart, et. al.) leave no doubt as to which side the NEH takes in the "canon war."

Embedded in all this material are significant questions which must be used to give continuity; the nature of a good society, the function of religion, the proper source of authority, etc. The plan requires devoted teams of faculty willing to coordinate disciplinary materials into workable integrated units and to provide threads of continuity to lead from course to course. Rather than legislating what faculty should do, the secondary purpose of the report is to call attention to the variety of ways their suggested coherence may be realized.

The Cultures and Civilizations unit does not exhaust NEH tinkering. For example, the plan advises mathematics studies in the history of math, biographies of its leading thinkers, and analysis of the value theories that underlie its thought process. Another general education mathematics option is to stress the solutions to very practical problems in business management, statistics, and social choice theory.

Social Sciences, the plan asserts, are based upon questions about human nature and society that have timeless roots. Plato's *Republic* and Aristotle's *Politics* have as much relevance in a sociology course as in a philosophy course. In fact, the cumulative message of the NEH core curriculum proposal is that important ideas housed in influential texts must not be cordoned off and labeled "Humanities: Do Not Touch." The Humanities approach to knowledge should permeate the general education curriculum, and the report is one way of encouraging a movement in that direction.

50 Hours: A Core Curriculum for College Students" may be obtained by writing to the National Endowment for the Humanities, Washington D.C. 20506

ANKHERS AWEIGH

W. V. Davies. *Egyptian Hieroglyphs*. London: British Museum Publications, Ltd., 1987. 64 pg. Paperback, 4.95. Reviewed by Roger Johnson, Jr., University of Southern Mississippi.

This modest book has limitations that are both evident to the reader and honestly articulated by the author. The book serves as introduction to a language and a way of writing that remain inherently fascinating and historically important. Ancient Egyptian is probably the second oldest recorded language (after Sumerian) and stands as the language having the longest documented history--almost four thousand years. To accomplish a meaningful introduction in less than a hundred pages is a formidable task and requires the perspective and judgment of a seasoned scholar. W. V. Davies is such a scholar and has rendered a service to all those who are interested in ancient Egypt, but primarily to students of cultural history, the Middle East, history of language, and general humanities.

Language can indeed be a window into a civilization or culture, and the three central chapters of *Egyptian Hieroglyphs* constitute such an entry. They are the second through fourth chapters, respectively "The Scripts," "The Principles" and "A Little Grammar." A preceding chapter, "The Language," provides background information to orient the reader. The fifth chapter, "Decipherment," retells the drama of the Rosetta Stone, Johan Akerblad, Thomas Young, and Jean-Francis Champollion. For the reader who has progressed through the first four chapters, the story of decipherment and the history of modern Egyptology will have meaning far beyond that available otherwise though summary--because the reader will have become acquainted, first hand as it were, with some of the actual problems that confronted the earliest pioneers of Egyptology. A final chapter, "Borrowings," contains information about the relationships of Ancient Egyptian to Protosinaitic and hieroglyphic signs to Phonecian and thence to Greek and Latin alphabets.

As an example of Davies's conciseness and accuracy, one may cite his explanation of why some hieroglyphic signs represent objects as seen from the side while others depict objects from above. Referring to examples included photographically in the book, and noting the relationship of art and writing, Davies writes:

> A basic convention was that a figure should be depicted as objectively as possible, with no account taken of visual distortion. A figure was reproduced, two-dimensionally, in what was deemed to be its most "characteristic" aspect; in the case of a complex figure, it might be necessary to embody more than one aspect in a single representation. The hieroglyphs follow this convention. (p. 6)

Thus briefly and eloquently Davies illuminates the mimetic basis of hieroglyphic signs and, in the process, establishes the rationale of Egyptian graphic perspective.

The chapters entitled "The Principles" and "A Little Basic Grammar" go far in demystifying Ancient Egyptian. While providing an overview that is balanced and, insofar as possible, jargon-free, the chapters are more detailed than one would have expected. Step by step the author explains Egyptian employment of logograms, phonograms, determinatives, and calligrams, along with their mixture in word and sentence formation. The presentation includes carefully selected examples that lead ultimately to the reader's understanding of simple but authentic phrases. Although descending from Alan Gardiner's *Egyptian Grammar*, both chapters make good use of recent efforts to render Ancient Egyptian more accessible, in particular Wolfgang Schenkel's "Schrift" and H. G. Fischer's "Hieroglyphen" in *Lexikon der Aegyptologie* (5 vols., ed. Wolfgang Helck and Wolfhart Westdorf, Wiesbaden, 1984).

Because the book is so valuable as an introduction to the language and script of ancient Egypt, the last chapter is a slight disappointment. The tables of correspondence among alphabetic and other signs dominate the chapter and, in my estimation, lead the reader away from Ancient Egyptian, as though the point of the book were to reach an understanding of the history of Latin letters. To be sure, Davies is more cautious than Charles King (in *Hieroglyphs to Alphabets*, London, 1977), but such tables inevitably oversimplify relationships.

The library of no college where ancient history is taught should be without this book. Teachers of ancient civilization or western culture will find it to be an attractive, readable, and manageable supplement to more general texts. It is much more substantial than Norma Jean King's *Hieroglyphs: The Writing of Ancient Egypt* (1985), another volume by British Museum Publications. Those who teach courses that include Ancient Egyptian should be advised that the slim volume make an excellent introduction to Gardiner's *Egyptian Grammar*, providing perspective and clarity for the beginner. It is the single most valuable general introduction to the language and script available in English.

NEVER THE TWAIN

"Integrating Oriental Philosophy into the Introductory Curriculum" by Joel Marks, in *Teaching Philosophy* (September, 1989). Bowling Green State University, Bowling Green, OH 43403-0189. $18.50/year; $7/issue.

"Publishers, are you listening?" is the closing sentence of this article, for even though Marks sets forth a variety of approaches to integration of Oriental and Western philosophies, some are rendered impractical by the lack of textbooks. Nonetheless, a global emphasis in introductory philosophy course is devoutly (or skeptically) to be wished. Teachers will protest that they can't do an adequate introduction to western philosophy in a semester--how are they to add eastern thought? Marks, who teaches at the University of New Haven, accepts the first part of the statement, pointing out that we always make selections in any introductory course, so why not do the same in an Eastern-Western course? He suggests three basic approaches to integration and selection: divide the course into one-half East, one-half West with an integrating term paper; divide the course into problems, each of which balances East-West standpoints; or thirdly, limit the course to a single *domain* of philosophy, such as Method (what is philosophy?), Ethics (how shall one live?), Self (what am I?).

There are difficulties with each, particularly because the western tradition allows for "bookishness," that is, you can study about philosophy without committing yourself to it. Thus, while we can teach students how to analyze a logical argument, can we also teach them to meditate? Can we teach about the meaning of life without "having cracked that nut" ourselves? The oriental teacher of ethics should have done so, but "this is simply not to be expected of the teachers to whom this essay is addressed."

Marks does not dwell on matters of definition, but notes that there is not a total distinction between the two philosophical traditions, and that when one adds Islam, Native American, African and western Feminist views to the Hindu, Buddhist and Chinese philosophies that he considers in this article, the distinctions at very least lose their hemispheric division. Despite the closing sentence, this article does have a good discussion of available resources. (F. Schroeder)

SPACED OUT

"Picture Space and Moral Space" by B. R. Tilghman in *British Journal of Aesthetics* (Autumn, 1988).

Fans of the art of the Italian Renaissance know what a revolution in the exploration of space was achieved by the invention of scientific, linear perspective by Filippo Brunelleschо. A quarter-century or so later Leon Battista Alberti wrote a treatise on painting that provided a theoretical and philosophical context for the new invention. Looking into Alberti's *On Painting* with a fresh eye, Tilghman, who teaches philosophy at Kansas State, argues that the revolution in space perception goes hand in hand with the new interest in people.

In Renaissance painting, Tilghman says, we first see human beings occupying interrelational space. That is, the personages in a Biblical or historical painting confront one another in a dramatic sense. Quoting William Ivins on the lack of a sense of spatial organization in classical Greek art, "The Greeks represented Jim making a single gesture such as he might use in a fight and somewhere they represented Jack making another such gesture, but they never represented the fight *between* Jim and Jack.... "Alberti, though, places *composition* (the arrangement of people in space) as the highest aspect of painting, saying "We painters who wish to show the movements of the soul by movements of the body are concerned solely with the movement of change of place."

Yet these artists did not go the next step toward invading the space of spectators. Renaissance paintings are like a proscenium-framed drama. With Carravagio and Rubens the picture frame is crossed; indeed in some paintings of Rubens the viewer occupies "a pedestal" surrounded above, below and around by the created space of the painting. The American artist Frank Stella regards Picasso's early cubism as a similar space revolution, but he laments what has happened to abstraction since. Artists have lost their way and what began as creation of space for subjects to "live in" has become flat and without meaning. Carravagio, where are you now that we need you? (F. Schroeder)

LIVY LIVES

"Dawn of the Eternal City; Archaeologists Illuminate the Shadowy Origin of Rome" by Albert J. Ammerman in *Italian Journal* 1989, No. 5. Italian Academy Foundation, 278 Clinton Avenue, Dobbs Ferry, NY 10522-9909. $36/yr.

We all know of the she-wolf who suckled the legendary founders of Rome, Romulus and Remus, and we all know how Schliemann's faith in the *Iliad* led to the discovery of historic Troy. Could there be any truth to the accounts of Livy, Varro and others? Fairly accurate history of Rome begins with the Republican period, from 509 B.C. forward. This was preceded by the Regal period which began about 750 B.C. with legendary Romulus and Remus, closing with the more historical Tarquin kings. In the myth, Rome was actually founded by Romulus' tracing a boundary line by plowing a ritual furrow, which symbolized the place where a ditch (*fossa*) was dug and a wall (*murus*) was erected.

Archaeological study of Rome has been going on for 150 years. Some of the most interesting finds were made around 1900 by one Giacomo Boni who excavated the Forum, the center of truly urban activities, finding nine fora surfaces below the Imperial piazza. The lowest was gravel, eleven feet down. Around 1950 a Swedish archaeologist, Einar Gjerstad advanced the theory that dominated until the past few years. This shows Rome's origins in a dispersed society of hill-top hut-dwellers, gradually spilling into the valleys below, finally to establish a unifying forum, paved with gravel about 575 B.C. Recent works, characterized by new interdisciplinary environmental archaeology, not only puts the first forum fifty years earlier, but shows this to have been a major engineering feat, requiring some 20,000 cubic years of landfill. Furthermore, in 1987 Andrea Carandini of the University of Pisa uncovered evidence of a major ditch and wall along the Palatine Hill. It dates from the traditional period of the founding of the city by Romulus. So at this moment, it appears that Rome's origins may not be in primitive villagers, but in city plans and engineering on Etruscan models of the 8th century B.C. (F. Schroeder)

NON-COMPUTER CATS

"Patterns of Information Seeking in the Humanities" by Stephen Wiberley Jr. and William G. Jones on *College and Research Libraries*, November 1989.

Humanities scholars are a different breed of cat, that's for sure. The way in which we do research is apparently unique, compared to scholars in the natural and social sciences, at least if this indepth study of eleven humanists can be multiplied by a thousand and made into a generalization. The small sample were mature, well-published college professors who participated in a yearlong seminar at the Institute for the Humanities at the University of Illinois at Chicago. The librarians who studied their ways of seeking information are at the same institution.

The main finding was that none of the humanities scholars relied on computer searching for research material. For that matter, they didn't make much use of sophisticated bibliographies such as PMLA or *America: History and Life*. That doesn't mean that they were ignorant of research in their areas: most browsed bibliographies covering the geographic area or the time period that interested them, but these tended not to be library sources but publications of professional associations of which the scholars were members. Another curious fact is that the humanists rarely if ever asked assistance of reference librarians. This didn't seem to reflect on the competence of the librarians; it's just that the humanists seemed to prefer a do-it-yourself approach. Indeed, with at least one humanist, asking for help was an admission of ignorance, so it was preferred to use simple finding tools (not identified, but presumably on line public access, card catalogs, *Humanities Index*, *Readers Guide*, etc.) rather than arcane bibliographies and new data bases. The exception to this rule related to the "real stuff" of research, primary sources. In special collections and archives, the scholars felt no compunction about seeking help and instruction.

All the humanists were studying people, and the authors of the study noticed two patterns of information seeking not previously identified by information specialists (i.e., librarians) who have examined various groups. These are the "geographical" and the "genealogical." Using telephone directories and maps, the scholars traced the home sites of their subjects, went there, and used local historical societies, public libraries, archives and museums, and, in several cases, on-site interviews.

Probably, though, the greatest difference between humanists and scientists, is that while scientists do collaborative work, humanists are independent, introspective loners. Like some Siamese cats we've known. (F. Schroeder)

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity, humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

HUMANITIES EDUCATION

Dedicated to the teaching of integrated studies among the humanities, arts and related fields in schools, colleges and cultural institutions.

FISH IN WATER, WEIGHTLIFTERS IN PINK ROOMS: LANDSCAPES, ENVIRONMENTS, AND LEARNING IN THE HUMANITIES

The two-page advertising spread in a recent *Newsweek* featured a set of barbells against a shocking pink cinderblock wall. "Color has power," the copy began. "Research suggests weightlifters actually lift less in pink rooms. And the color on this page did get your attention."

Unless the color, shape, or some other feature stands out so insistently, however, the environment does not often catch our conscious attention. It is axiomatic that we fish do not see the water that we swim in, although the qualities of that water are crucial for our lives. In his fascinating article "Experiencing Places," Tony Hiss points out that "far from being simply a kind of backdrop that we can ignore at will—as long as it permits us to see and breathe adequately--such things as the kind of light around us, the chemical composition of the air, and colors, spaces, materials, shapes, scents, sounds, and views affect our physical health; our mental grasp and agility; our ability to work productively; our sense of self; the ways we interact with other people; our ability to function as citizens in a democracy; even our sense of humanity and our sense of humanity's pressing problems and unfinished business."

William H. Whyte has demonstrated that people are unconsciously affected by small features of public parks--slight elevations, stairs, open areas--that either invite them into a place or send them away. Teachers realize intuitively, even if we don't consciously think about it, that particular classrooms affect the learning that occurs within them; the physical environment of some classrooms encourages active participation while other rooms discourage anything beyond passive, quiet note-taking.

Our courses, too, no matter what the announced topic and the overt intention of the instructor, often feature place, environment, nature, cityscapes. As I was editing the material in these two special issues of *Humanities Education* I was also teaching a survey course in early American literature and a graduate seminar in Thoreau. The concurrent duties made me especially aware of how important place is to American history and literature and to our self-definition even today. Native Americans explore the shape of the land and their own relations with it in their origin myths and sacred songs; early European adventurers organize and alter the new land by perceiving it through Old World eyes; southern colonists celebrate life in a restored Eden; their New England counterparts find a biblical "desert" and set about creating from it God's "citty upon a hill"; Thoreau (most of whose major works are titled with place names) rails against the village in which he has traveled a good deal and celebrates the necessary tonic of wild nature. Without my consciously intending it, place loomed large in the syllabi for both courses. To and from classes I would walk through April snow squalls that made me wonder why I had traded southwestern Virginia for Duluth--and then occasional glimpses of Lake Superior assuming its spring colors and textures reminded me of part of the answer.

This issue of *Humanities Education* and the next are devoted to helping make us and our students (in whatever educational setting) conscious of the importance of place--to encouraging fish to realize and explore the water. The places included range from the relatively small (public monuments) to the large and grand (specific cities, the city in history, the wilderness, nature as a whole). The various articles share the assumption that environment *is* crucial to understanding human life and should be included in learning about the humanities. Because of its complexity, the topic lends itself well--indeed, it requires--interdisciplinary approaches to learning. It taps not only literature and history but art, geography, architecture, psychology, anthropology, political science and other disciplines. These different perspectives all suggest that place provides important clues about our values, perceptions, self-definition, culture, history, and our future.

Excellent studies of landscapes, cityscapes, and environments have been available for years; works by W. G. Hoskins, P. F. Lewis, J. B. Jackson, D. W. Meinig, and Yi-Fu Tuan come immediately to mind. More are coming out all the time (e.g., by Charles T. Goodsell, John A. Jakle, and the authors reviewed in these two issues), an indication of continuing and perhaps increased interest. The University of Iowa Press is publishing "The American Land and Life Series," books "ruled by the conviction that landscape offers the largest body of evidence for certain kinds of cultural and social action, a body of evidence which has been overlooked for the more easily studied archival sources used by traditional scholars" (promotional brochure). The Johns Hopkins University Press, also, offers a series devoted to "Creating the North American Landscape." This growing wealth of material should be available for our students and should affect the way we teach. The recent revival of Earth Day, too, reinforces the timeliness of making education about environments a significant part of humanities learning at all levels and in all modes.

As Meinig has written, "Any landscape is so dense with evidence and so complex and cryptic that we can never be assured that we have read it all or read it aright. The landscape lies all around us, ever accessible and inexhaustible. Anyone can look, but we all need help to see that it is at once a panorama, a composition, a palimpsest, a microcosm; that in every prospect there can be more and more that meets the eye." The goal of these two issues of *Humanities Education* is to make the eyes (and other perceptual organs) of our students more acute; to introduce ways of approaching landscapes, cityscapes, and environments in various learning situations; to provide a vocabulary and various methodologies for studying these rich topics.

In this issue, Tad Park offers the first half of a museum tour that models what to say about particular art works while placing them in the context of periods and movements in humankind's relationship with its environment; four slides for class use and/or personal enjoyment accompany his essay. Sharon Scholl outlines an interdisciplinary course centered on nature that examines the connections between science and the humanities, spirit and matter. Robert A. Schneider uses a novel to explore American places and to demonstrate how use of space reflects value judgments and how particular settings carry individual and cultural meaning. James A. Percoco shares his methods for making students aware of public monumental art and its roles in a culture. Bryan Feuer describes a course intended to help students see their own culture in historical perspective through a comparative, multifaceted study of specific cities from ancient Ur to modern Los Angeles. And Deborah DeZure offers an experiential learning project that introduces students to the study of one city.

The summer issue of *Humanities Education* will feature the second half of Tad Park's museum tour along with four more slides. W. Arthur Mehrhoff discusses what phenomenology of place (particularly the study of national symbols) can contribute to a holistic understanding of American culture. Laura Cowan details the contributions that poetry can make to interdisciplinary environmental education; she provides an overview of significant changes as 19th- and 20th-century poets express humankind's relationship with nature. Carol P. Hovanec describes a course that focuses a survey of American literature on the physical environment (landscapes and cityscapes). Fred E. H. Schroeder offers "The City" as a rich, concrete, complex theme for humanities education--and explores the paucity of visual art devoted to the city. Correcting a common oversimplified image of Ralph Waldo Emerson, Rosalie Murphy Baum details Emerson's often positive views of what cities add to human life. Finally, Marcia Bundy Seabury discusses the concept of the *Wanderung* (ramble or extended exploration of the countryside) as an approach to interdisciplinary study of artists and their milieux. Both issues also feature reviews of recent books devoted to our broad themes of landscapes, cityscapes, environments and teaching in the humanities.

A DIALOGUE WITH NATURE
PART I

Introductory Remarks on Landscape

Landscape painting has a long history, closely linked at every stage and in every form with that of changing cultural attitudes and conceptions toward the natural or built environment as those have varied down the ages and from place to place. Our human response to nature--which is not always love of nature--is as old as civilization. To quote T.H. Huxley, the great champion of Darwin, "The question of questions for mankind--the problem which underlies all others and is more interesting than any other--is the ascertainment of the place which man occupies in nature and of his relation to the universe of things."

This question is what leads us to record our observations of the world around us. It inspired Homer, the Greek poets, and Virgil, but not until comparatively recently did it inspire an independent branch of Western, as distinct from Asian, art. In the European tradition the appreciation of nature as scenery to be contemplated with awe or delight, and along with it the rise of a true school of naturalistic landscape painting, was a surprisingly late development which began only with the Renaissance. Even in the 17th century, when numerous practitioners were making their living from "pure" landscape and critics were forced to take notice of the fact, it was not ranked very highly on the scale of fine art; next to the bottom, in fact, just above flowers-and-fruit. This may be contrasted to China, where the Taoist philosophy of humans living in harmony with nature led to landscape painting becoming the major tradition, practiced and encouraged by the scholar-officials who ran the empire.

Western civilization with its Judeo-Christian roots has always had a dualistic approach to nature as something which both reveals the sacred and is given to humans to be exploited. That the legacy of this philosophy is not an altogether happy one means that the question raised above is still true today, when our despoliation of the natural world has resulted in an ecological crisis.

The eight works of art included here are not meant to be a comprehensive historical coverage of attitudes toward nature. They do provide an adequate sampling from different periods and places. The *Jade Mountain* epitomizes the Chinese reverence for nature and the human role in maintaining a balance of forces. Hubert Robert's 18th-century "folly" reflects that age's mechanistic view of the universe and its confidence in human ordering of even natural elements. Courbet presents a more respectful, "hands off" view of the natural environment in an impersonal rendering akin to the Naturalism of his compatriot Zola. Kandinsky by contrast is totally subjective, using nature solely as the vehicle for his personal symbolism. Morrison expands the definition of landscape with his monumental collage, actually incorporating the environment into his representation. The three cityscapes also present contrasting approaches: Pissarro revels in the energy of a Paris still newly transformed under Baron Haussmann, O'Keeffe depicts her personal ambivalence toward New York's concrete canyons, and the emigrant Kokoschka celebrates the sense of vitality and freedom he found in the bustling city of London. Each work reveals both an individual response to the stimulus of place imagination and a cultural attitude toward the environment. Each gives a partial answer to Huxley's question and provides at the same time an impetus for contemporary exploration.

China, Ch'ing Dynasty, Ch'ien Lung Reign, 1736-95
***Jade Mountain*, 1784**
Nephrite jade
Extended loan from the T.B. Walker Foundation 12.5

The Ch'ing Dynasty (1644-1912) was the last period of imperial rule in China and the second of the great foreign dynasties to reign during that country's long history. It was founded by the Manchus from the north, relatively peaceful conquerors who adopted and ruled through traditional Chinese institutions of government, philosophy and religion. They also respected Chinese cultural tradition and sought to preserve the great achievements of the past and to encourage the arts of the present. One of the foremost patrons of art and scholarship was the emperor Ch'ien Lung (1711-99, ruled 1736-95), whose reign is regarded as the last truly creative period in Chinese art. Ch'ien Lung was himself a prolific painter, calligrapher and poet and his collection of Chinese paintings of all periods was one of the greatest ever assembled. Under his rule the textile and ceramic arts also flourished and jade carving reached its technical and aesthetic peak.

The Chinese consider jade to be the most sacred and treasured of all precious stones. Their word for jade is *yu*, meaning pure, precious, noble and "right." Its physical characteristics were believed to express the greatest of human virtues: it is soft and glossy, like benevolence; fine, compact and strong, like intelligence; angular, though neither sharp nor cutting, like righteousness; internally radiant like faith; pure of sound when struck, like wisdom; and able to be broken, but not bent, like courage.

The choice of landscape as its subject matter reinforces the connection of the *Jade Mountain* with virtuous behavior. Landscape recurs again and again in the literary and visual arts of China. Scenery was considered to be not merely aesthetically pleasing but it struck a deep chord in Chinese philosophy. Nature revealed the vastness of the universe, in which humans were thought to play an insignificant part. At the same time, careful attention to the ways of nature could offer the keys to balance and harmony in the world. The followers of Confucius drew their wisdom from "the natural order of things," and the Taoist philosophers urged close harmony with nature. Thus motifs from nature used on ceramics, textiles and lacquerware or as the subject for paintings or carvings or in literature generally carried symbolic overtones.

The *Jade Mountain* commemorates a gathering held at the Orchid Pavilion of Lan T'ing near K'uai Chi mountain in Chekiang province. It was to this spot that on March 3, 353 C.E. the gentleman-poet Wang Hsi Chih invited 41 of his scholarly friends to tend the graves of the ancient dead and spend the day in contemplation of nature. Relaxing by the banks of a meandering stream where orchids grew in abundance, the group consumed wine from cups floated downstream and composed poems for the occasion. Wang later assembled the poems and immortalized the historic party for future generations in a long poem entitled *Prelude to the Orchid Pavilion*. Composed of 324 characters in 28 lines, the text is a rather sophisticated discourse on the meaning and enjoyment of life, death, the past and present. Because the Chinese consider calligraphy to be the highest of all art forms, and because Wang was regarded as the greatest of all art forms, and because Wang was regarded as the greatest of all calligraphers, many copies of his poem were soon in circulation. It has received great attention and respect from artists, poets and calligraphers in China and Japan ever since.

Although his name has not come down to us, the artist who conceived and carved the *Jade Mountain* must have been an honored and respected member of Chinese society. The creation of any jade object required great skill, patience and discipline, due to the extreme hardness and dense, compact nature of the stone. This can certainly be appreciated when looking at the crisply defined ridges of the hills, the leaves on each tree, the delicate cups floating down the brook and the tiny yet distinctly individual figures walking the mountain paths. Equally remarkable is the delicately inscribed calligraphy on two sides of the mountain: Wang Hsi Chih's famous preface, reproduced below, and a dedicatory poem written by Ch'ien Lung.

It is not surprising that an enlightened connoisseur and patron like Ch'ien Lung would commission and comment upon such a piece as this. In addition to being a statement of technical prowess the mountain would have called for great scholarship, aesthetic sensitivity and feeling for life. It is not just a reverent tribute recalling the historic event of a poets' gathering. Nor is it merely a decorative triumph of the jade-carver's art, or yet another copy of a famous poem. Rather, it is a combination of all these things, uniting in one work the best of the past and the present and embodying for the viewer the important Chinese virtues of scholarly activity, love of the arts and oneness with nature.

Prelude to the Orchid Pavilion, Wang Hsi Chih

In the late spring of the ninth year of the Yung Ho reign, a gathering was held at Lan T'ing, the Orchid Pavillion, north of K'uai Chi mountain. The meeting was held to clean and repair the honored graves and all the luminaries came. Young and old alike were gathered together. At this site were steep and magnificent mountains of lush forests and elegant bamboo. Here, too, was a clear, rapid running stream, traversing the slope which could be used to float the wine cups. We sat about the banks of this stream. Although lacking the joy of flute and string, a single cup and single poem were sufficient to draw out the deepest emotions. On that day the sky was bright, the air pure and the gentle wind a thing of tranquility. Gazing upward the vastness of the universe could be comprehended; downward one saw varied abundance of things. All that the mind and eye conceived was best appreciated through the senses. It was a delightful experience! In this generation one is influenced by experiences within his own tiny environment, but one's emotion comes from outside his material existence. Although there are ten thousand moods of fondness and dislike, and a difference between action and non-action, when a man feels joy he is content to know that that feeling may be confined to him alone.

With this acceptance one will never notice the approach of old age. When one is fatigued through thought the feeling is joy, and that emotion will suddenly become a thing of the past. Still, these are the things which excite one's emotions and all achievements and failures are thus transformed and finally come to an end. The ancients stated that birth and death are great events. Such pain! In tracing the course of the emotion involved in building a grave I always feel grieved although I know that birth and death are illusions and that the (legendary) birth of Chi and the demise of Pong are untrue. Our concept of posterity is presently formulated and can be likened to our present view of the past. A sad situation! Therefore, I record and collate all the writings of my contemporaries. Although the occasion may change from this one and although the next generation may be different from this one, what touches one's heart remains the same. Posterity will be inspired by these verses.

Hubert Robert
French, 1733-1808

The William Hood Dunwoody Fund
33.14

Life among the French aristocracy of the later 18th century was marked by contrast and contradictions. Chief among these was the rise of a taste for naturalness and simplicity in an age noted for its theatricality and artifice. Signalling the birth of a Romantic sensibility that stressed emotion over intellect, this new taste was nowhere more evident than in the art of landscape gardening.

The new sensibility was actually born in England, but by the 1760s, stimulated by visits to English gardens and by publications about them, French landowners and designers were rejecting the formal traditions they had observed since the Renaissance and were placing them with what was understood to be informal style more in harmony with nature. Gone were strict symmetry and regularity of proportion, and in their place came wildness, picturesque "accidents" and the irregularity of growing things. Ironically, where such a landscape was not already native it was constructed, as a kind of stage set where the aristocracy could act out their fantasies of leading the simple life. Whole villages were moved, mountains leveled or raised and ancient ruins newly built--all in an attempt to create a "natural" environment.

In 1784, the wealthy financier Jean-Joseph de Laborde acquired the chateau and estate of Mereville, some 45 miles south of Paris. With the help of the eminent architect Francois-Joseph Bellanger and later of the artist and landscape designer Hubert Robert, de Laborde spent the next ten years transforming the place into one of France's most celebrated landscape gardens.

The earliest account of the work at Mereville dates from April 1786. The garden site was then a marshy valley, hemmed in by rocky outcroppings, and in transforming it into an elegant landscape of several square miles, de Laborde and 400 laborers literally moved a mountain. The marsh was drained and stripped, the offending high ground leveled, and its stony debris spread as necessary foundation. Next two kinds of topsoil were mixed and distributed over the surface and then building and planting began. A river was re-routed into sinuous channels "such as the eye delights to dwell on and which, after all, are modelled after Nature," and one of its two arms was led underground to emerge miles away at the head of a 12-foot rocky cascade. Not far from this site a public road divided the main park from a smaller park, where a smaller chateau, stables and a coach house stood on a hill. The road, which ran through a cutting, is probably the one shown in *Le Pont Rustique*. To the left may be seen one of the garden's deep artificial grottoes; in the distance is a picturesque "ruin." A fragile bridge spans two great masses of roughly hewn rock, connecting the main park with its smaller companion. Such rustic bridges evoked Alpine scenery and were thought to introduce a touch of wildness into vistas otherwise tame and familiar. Part of their charm was the danger that they might collapse, which sooner or later, no doubt, they did. It may be observed that the rocks and the stone fortification supporting one end of the bridge look decidedly artificial, even theatrical. This, however, does not necessarily imply that they were imaginary. Robert's chief contribution to the development of garden design was his exploitation of theatrical and painterly elements. It is a style in which nature is often arranged to look like art.

While the garden landscape in *Le Pont Rustique* reflects a basic Romantic sensibility, the style of the painting itself is that of the waning Rococo. Lighthearted and decorative, it is primarily interested in recording the gaiety and elegance of the scene, using the playful curved line, delicate pastel colors and free, graceful movement typical of the Rococo. We cannot even know for certain whether Robert is presenting a truthful image of the park as it appeared or a proposal for a new construction, as Mereville, like the nobility it delighted, vanished with the Revolution.

Gustave Courbet
French, 1819-1877
***The Castle of Ornans*, about 1850**
Oil on canvas
The John R. Van Derlip Fund and the William Hood Dunwoody Fund
72.66

"Painting is an essentially concrete art, and can only consist of the representation of things both real and existing....An abstract object, invisible or nonexistent, does not belong to the domain of painting...." With such statements, Gustave Courbet became the spokesman for the French Realists, a radical group of writers and artists that emerged in the mid-19th century. Championing the ordinary and the actual and rejecting all mythological, religious, historical and imaginary themes, the Realists constituted the first truly modern movement in art.

Castle of Ornans is one of Courbet's most ambitious landscapes. A splendid panoramic vista embraces the valley of the Loue, which is framed on either side by screens of trees and bluffs of high ground faced with the rock escarpments characteristic of this region, the Franche-Comté) of eastern France. In the distance is Courbet's native village of Ornans, a cluster of houses straddling the river Loue. "Castle of Ornans" refers to the hamlet on the cliffs, built on the site of a medieval fortress that had belonged to the dukes of Burgundy and was destroyed in the 17th century. A small figure of a woman laundering clothes by a stone trough in the foreground, her presence accentuated by a splash of bright red at her feet, serves as an indicator of scale. Standing with raised arms as she holds out her linen, she seems to embrace the view spread out behind her and at the same time to invite the viewer imaginatively to enter the scene and journey through the landscape. At the same time, she serves as a reminder of Courbet's Realistic sympathies: she is the antithesis of the nymphs and dryads who hover in the forest and lake idylls of the classical Academic painting rejected by the Realists.

Courbet achieves a masterful rendering of depth by modulating his color from the soft greens of the spring foliage in the foreground through the brownish patches of barren upland in the middle distance to the misty blue-violet of the far distance. The idea of landscape implicit here is of straight-forward, unidealized reportage where the artist selects an advantageous viewpoint and adopts a coherent pictorial scheme but does nothing to alter the view presented. "Where I place myself is all the same to me," Courbet is reported to have said; "Any location is as good as long as I have nature before my eyes."

Recent scholarship has sought to establish that Courbet's landscapes embody the kind of social and political meanings that are more overtly expressed in some of his great figure compositions. It has been suggested, for example, that in this prosaic depiction of a place steeped in medieval history Courbet was subverting the trite theatricality of the romanticized legends that regularly filled the walls of the Salon. It has also been interpreted, in a more general way, as a sort of *vanitas* symbol conveying the idea that the splendor of medieval French history cannot withstand the process of time: the modest village represents the embodiment of the present victorious over the past, peasants' houses over feudal ruins, and reality over fantasy.

The extent to which *Castle of Ornans* contains this kind of meaning must remain speculative, but there is little doubt that the view of nature presented here conforms to a general belief in primal nature that was widespread in the mid-19th century. The Franche-Comté), like the Auvergne or Brittany, was one of those regions that during the 19th century came to be viewed as a particularly remote, unspoiled and "primitive" part of France--in opposition to the corrupting and constraining effects of Paris--and one that was characterized by a strong spirit: he saw it as a river that was more genuine and wild than the Seine and whose banks, unlike those of the Seine, were unenclosed. It seems likely, therefore, that in this confident and expansive landscape Courbet was expressing not only his love of his native region but also the independence, wildness and free spirit of the Franche-Comté).

Wassily Kandinsky
Russian, 1866-1944
***Study for Improvisation V*, 1910**
Oil on linen
Mr. and Mrs. Bruce B. Dayton Fund
67.34.2

Since the Renaissance, Western artists have traditionally attempted to imitate nature, thus producing a vast body of works depicting people, places and things as though the canvas were a mirror reflecting the world around it. In the early 20th century, however, this custom was increasingly abandoned in favor of the theory that a work of art is a reality unto itself, with its own laws and its own reasons for being. This new belief provided the needed impetus to open up a whole new realm of artistic possibilities, enabling artists to choose for themselves between the extremes of imitative realism and completely non-representational art.

Wassily Kandinsky is sometimes credited with having painted the first total abstractions in Western art. While other artists are also candidates for this honor, it is certain that he is one of the greatest innovators in the history of modern art. His style, radical and startling in its day, may be classified in a number of ways. Its highly personal, intuitive approach to depicting the world may be described as expressionistic--that is, more interested in manipulating line, shape and color for their emotive than their descriptive effect. Kandinsky even introduced exaggerations and distortions in order to create a greater emotional impact.

These distortions, together with a certain calligraphic simplification of form, also place Kandinsky at the forefront of the movement toward abstraction--that is, an art more interested in manipulating the formal elements and principles of design for their own sake than in naturalistic representation. Seeking an art that would be concerned only with the spiritual, the inner psyche rather than the rational universe, Kandinsky tried to rid his painting of representational forms.

Kandinsky was a deeply religious man, influenced both by the Orthodox faith of his youth and, later, by the teachings of Theosophy (a popular religious movement concerned in part with humankind's relationship to the cosmos and the play of forces within the Divine nature). Further, like many of the intellectuals of his day, he felt that the world was headed for disaster, that the rationalistic promises of science had failed humanity, and that there was a need for a spiritual rebirth. This he saw as the great mission of the modern artists. Equating purely representational art with negative, materialistic forces, Kandinsky sought to purge art of objective references and thus return it (and society) to the realm of spiritual values.

This theme, the struggle between the opposing forces of the negative materialistic world and the positive spiritual one, is the basis for much of Kandinsky's art between 1910 and 1916. The works of this period are often complicated allegories whose motifs are drawn from the traditional pictorial imagery of Christianity: the Deluge, the Apocalypse, the Resurrection of the Dead on the Day of Judgment.

Some of this symbolism may be easily interpreted while the remainder is highly arcane, its meaning private to Kandinsky. Indeed, he did not intend that the viewer should immediately recognize the specific symbolism of each motif. Rather than merely describing his forms, Kandinsky reduced the imagery from profile to linear notation and, ultimately, to sign. Colors, to which the artist assigned symbolic connotations as well, were used to further "veil" or obscure the drawing. At times the choice of color reinforces the imagery, at other times it is independent, even contradictory in meaning. Only in this way, Kandinsky felt, could the observer escape being seduced by the "story" alone and respond freely to the deeper reality (what Kandinsky called the "inner sounds") of the colors and objects presented.

A preliminary work for a much larger painting, now destroyed, *Study for Improvisation V* appears at first glance to be completely without reference to objective reality, but this is only the effect of Kandinsky's "veiled" imagery. The colors are indeed extremely rich; the contrasts of red, blue and yellow almost overwhelm the descriptive elements. Yet a landscape, seemingly a garden in full bloom, and figures can be discerned, and their presence reveals that despite the joyful colors, the theme of the painting is probably drawn from Biblical images of destruction.

At the lower left a looping motif is seen which Kandinsky used in numerous works to represent the wave of the Deluge, while in the opposite corner two riders (identified with the Horsemen of the Apocalypse) gallop across the scene. Closer inspection reveals a kneeling supplicant figure (female?) in a blue cloak at the lower right and, standing in profile at the composition's center, a second figure (variously identified as male or female) whose hair streams in the breeze. Its rigid stance makes it an image of stability in the midst of the destruction, and scholars interpret this figure as an arisen soul, called forth from the grave on the Day of Judgment.

Thus "decoded," this is clearly an apocalyptic vision, intended to convey the imminent approach of the end of the world. But the effect of the painting is not one of terror or despair; the colors are bright and spring-like and evenly balanced between warm, changing hues and cool, stable ones; a similar balance is created by the placement of solid blocky shapes next to fluid sketchy ones; and while the forms suggest that the action depicted is beyond human comprehension--every object seems capable of evolving into something else before our eyes--at least some of the images seem to offer hope.

In the final analysis, Kandinsky's abstract landscape is a testament to his belief that a new spiritual epoch would emerge from the destruction of the old, just as a new artistic order was being forged by the painters of his generation. In Biblical terms it represents humankind returning to an unspoiled Garden of Eden as the Apocalypse ends in the creation of "a new Heaven and a new earth."

NATURE AS SPIRIT

A new course was added this year to our Humanities program bearing the title "Humanities and Science: Nature." The goals of the course are to encourage a lifelong interest in imaginative and scientific literature for the layman; to increase visual and aural literacy; and to explore the connections between science and the humanities. The course is divided into segments corresponding to various positions Western people have taken in relation to the natural world. In the order of presentation they are: Nature as Spirit, Nature as System, Nature as Friend and Enemy, and Nature as Victim. Each of these perspectives is developed with readings from science, short stories and essays, works of music and art. Since there is no available text for such a course, a collection of readings was assembled and Xeroxed, accompanied by the trauma of securing and paying for permissions.

The course in its present format is a compromise between an historical and thematic plan. For example, the second section is a mini-history of science module hitting the high spots between Aristotle and Stephen Hawking. Thus Nature as Spirit (admittedly the least scientifically oriented) begins with a chronological sampling of spiritual communities that have attempted a synthesis of God, mankind, and the natural world. An eloquent voice for the world of the American Indian is that of a Sioux medicine man as recorded in *Black Elk Speaks*, by John Neihardt. The geese with magic voices, the grandfathers who make thunder, the tepee roofed with cloud populate the vision of this spiritual master. "It is the story of all life that is holy and is good to tell, and of us two-leggeds sharing it with the four-leggeds and the wings of the air and all green things; for these are children of one another and their father is one Spirit." (1)

Two significant artistic traditions that connect with the sentiments of Black Elk are Hopi Kachinas and Navaho Sand Paintings. The Kachinas are dolls which represent the spirits that provide fertility to earth and sustenance to humans. Their costumes are richly symbolic in color and figuration; their living counterparts are the masked dancers who celebrate the seasons, bearing gifts to loved ones in the tribe.

Navaho Sand Paintings are most commonly associated with the healing of illness by a medicine man. The figures, drawn by trickling colored sand from thumb and forefinger, represent powers known to be helpful for the condition at hand. Many of the nearly 500 recorded examples are rooted in the origin mythology of the Navaho; symbols are intricately combined for ritual meaning and artistic effect. An interesting modern offspring is the art of Jackson Pollock, which he confessed had Indian influences and a spiritually expressive intent.

American Indian music is dominated by nature imagery. One can note the totemic veneration of spirit animals or the invocation of natural forces such as rain or fire. A kind of sexual division is interesting to note: corn grinding songs for women, hunting songs for men. The theme of this instructional unit is powerful in the music: we and the natural world are of the same spirit.

The struggle to preserve or recapture this vision of nature in the midst of an artificial and "unnatural" urban world is a major issue for the contemporary Kiowa writer, N. Scott Momaday. He details the depressed lives suffered by so many Indians who live between cultures and how deeply the yearning for heritage runs. In *House Made of Dawn* his promise to a dying man is "to get drunk and sing ... about the way it always was. We were going to sing about the way it always was. And it was going to be right and beautiful ... he was going home." (2)

Ancient Egyptian culture provides another example of interpenetration of natural and spiritual thought processes. The vast pantheon of gods appears in guises furred, fleshed, and finned. There is Horus, the divine falcon representing the sky, whose two eyes are the sun and moon; he is the son of Osiris (underworld) and Isis (fertility). There is Anubis, the jackal-headed conductor of souls to the underworld, who holds the star-shaped cross, emblem of life. The *Book of the Dead* and the hymns to various aspects of nature are still readable and illuminating.

The Western Middle Ages boasts a true nature-mystic in St. Francis of Assisi. The story of the wolf of Gubbio told in the *Little Flowers of St. Francis* is a charming anecdote illustrating his power to communicate with other forms of life on the level of spirit to spirit. The related art is the cycle of murals based on the life of St. Francis completed by Giotto for the headquarters monastery. Francis' own "Canticle of the Sun" is the best illustration of his sense of the spiritual unity of the whole natural order. The medieval monastery itself illustrates the community devoted to achieving a balance between the divine and the earthly; the meditation garden is a particular example. Though plainsong is usually unearthly in its orientation, the "O Magnum Mysterium" from the Christmas Night Offices is a useful exception. A rough translation runs, "O great mystery and wondrous sacrament, that animals should see their newborn Lord lying in a manager ... I have considered Thy works and trembled here between these living creatures."

A brief review of the spiritual community might include the Shakers, a paradigm of simplicity and devotion. They were practical scientists in their production of the best seeds and herbs. They bred superior strains of sheep and cattle. They viewed the earth as something raw and wayward to be redeemed by labor and love. A mid-Nineteenth Century Elder, Frederick Evans, is quoted as saying, "I don't know if a tree ever comes to know you; I think it may; but I am sure it feels when you care for it and tend it." (3)

Shaker furniture and artifacts provide plentiful examples of visual art; alas, albums of Shaker music have fallen out of print. The "Millennial Laws," first formulated in 1821, are useful guides to the esthetic of the Shakers and to the appeal of their unornamented but eloquent creations.

I conclude this brief time trip with a strange modern community in Scotland called Findhorn, whose inhabitants live with a profoundly spiritual approach to the land. They are a kind of "Sixties commune" guided by Devas (aspects of growth and creation neglected by modern man). Each plant species has its own spirit which guides the gardeners, and the "landscaped angel" communicates the needs of the farm as a whole. The cumulative philosophy is that humans are sentient beings among equally significant other sentient beings who are now distant and fearful because of our ill treatment of nature. If we open ourselves to them, they can guide us to a plentiful life.

Another section of the Nature as Spirit unit is centered on what used to be called "natural theology." The fundamental reading is William Paley's "Proof of God from the World of Biology" (1802). God is revealed, argues Paley, by the order and beauty of the universe; spirit is implied by matter. He goes on to derive the unity and goodness of God from observations of the system of nature. William Cowper's "Hymns to the God of Nature" elaborate on this same theme, though Wordsworth's "Lines Composed a Few Miles above Tintern Abbey" will be more familiar.

The foremost representative of the theology of nature in this century is probably Pierre Teilhard de Chardin. He declares, "It seems to me that every effort I have made, even when directed to a purely natural object, has always been a religious effort ... Science and Religion have always been for me one and the same thing." (4) In Teilhard's vision God permeates all things, and the world in return receives from God a kind of absoluteness. This process is going somewhere, leading inevitably to a point of unity and wholeness that we describe as love. For this stalwart Roman Catholic, Christ exemplifies the "Centric" where the oppositions of this world meet and are resolved.

Leibniz is the most convenient and eloquent exponent of the theory of spiritual permeation; it is well worth the time to read some sections of the *Monadology*. His discussion of our bodies as "divine machines" which represent the whole universe and are connected to all matter in the plenum is heady stuff.

Nineteenth-Century music is replete with the theology of nature. One of the most gracious examples is the "Good Friday Spell" from Wagner's PARSIFAL. The hero has slowly been redeemed through his life experiences and returns to the great hall of the knights to assume leadership. He sings of the extraordinary beauty of the meadows, to which Gurnemanz replies that all nature has been redeemed by Jesus' loving sacrifice; all living things are blessed by this act.

Mahler's "Song of the Earth" is a lengthy exposition on the theme of the spiritual consolation of nature. In "The Farewell" section the text explains death as being absorbed into the bosom of loving nature: "My heart is still and waits its hour. The dear earth everywhere blossoms in spring and grows green again. The distance shines bright and blue eternally."

The interpenetration of spirit and matter is a standard idea in Western art, appearing in many guises. The American Transcendentalists and Hudson River School of painters expressed the presence of the spiritual sublime in their landscapes. In his "Essay on American Scenery" Thomas Cole confesses, "In gazing on the pure creations of the Almighty, one feels a calm religious tone steal through his mind." Van Gogh's "Starry Night" is an eloquent expression of the spiritual power that courses through the universe. In more prosaic practice, earlier art often involves reading through some painted creature to a spiritual implication. Cranach's "St. Jerome in Penitence" (1525) takes this tendency to the extreme. The squirrel gnawing a nut is a seeker after divinity; the stork is filial devotion; the turtle and scorpion are evil influences; the pheasant a symbol of immortality. The real earth is a screen through which this spiritual analog is unfolded.

The teaching unit is completed with writings closer to scientific observation and analysis. In his *The Tao of Physics*, Fritjof Capra details the connections between ancient mystical teachings and the revelations of modern physics. Both assert "that the constituents of matter and the basic phenomena involving them are all interconnected, interrelated and interdependent; that they cannot be understood as isolated entities but only as integrated parts of the whole." (5) The interconnected cosmic web of nature is expressed in Hindu thought in the image of Brahma, the unifying thread and ultimate ground of being, but one that must be participated in rather than observed scientifically. Science has come to realize, as well, that there is no way to get rid of the influence of the observer.

Loren Eiseley, that most literary of anthropologists, leaves the pervasive impression in all his writing that he is looking for that unseen reality that he senses behind the bones and skins of the conscious world. "But beyond lies the great darkness of the ultimate Dreamer, who dreamed the light and the galaxies. Man partakes of that ultimate wonder and creativeness." (6)

As a kind of benediction, we conclude with Vaughan-Williams' "A Sea Symphony." The second movement, "On the Beach at Night Alone," has a marvelous text by Walt Whitman which reads, in part:

> A vast similitude interlocks all,
>
> All distances of space however wide,
>
> All distances of time,
>
> All souls, all living bodies though they be ever so different,
>
> All nations, all identities that have existed or may exist,
>
> All lives and deaths, all of the past, present, future,
>
> This vast similitude spans them and always has spanned
>
> And shall forever span them and shall compactly hold.

"A PLACE WHERE ONE COULD LIVE": WILLA CATHER'S USE OF PLACES IN *THE PROFESSOR'S HOUSE*

When I was given the opportunity to design and teach an undergraduate American Studies course on "American places," I knew it would have to include consideration of certain themes. Among them would be psychological and architectural understandings of "sense of place" and "use of space," literacy uses of spatial symbolism, regionalism in United States history and literature, attitudes toward and uses of the land, and the values underlying rural, small town, suburban, and urban life. Connecting all of these and organizing the course would be the simple contentions that the use of space reflects value judgments, and that particular places, of whatever kind or scale, carry individual and cultural meanings.

Coming up with course themes was easy, but deciding how to introduce students to those concepts, without either fragmenting the course into apparently unrelated units or risking a premature synthesis, was more difficult. Perhaps approaching them indirectly, through a novel, would work best. Philip R. Yannella, director of Temple's American Studies Program, had previously introduced me to Willa Cather's *The Professor's House*. Borrowing his many insights into the book, I decided to use it. Several semesters of the American places course have demonstrated that the novel is a painless and stimulating vehicle for engaging students' attention and raising a variety of relevant issues for consideration throughout the course.

The Professor's House, a readable novel of about 280 paperback pages, was first published in 1925 and is set in that era. Three "books" of unequal length tell the story of Professor Godfrey St. Peter's midlife crisis, the earlier adventures of his protege Tom Outland, and the self-discovery that resolves the professor's identity crisis. Book One, "The Family," takes up nearly two-thirds of the novel. It depicts the professor's discontent with his increasingly materialistic family and university (in fictional "Hamilton" near Lake Michigan). His havens from a heartless world are the blue waters of the lake, beloved as a special place since childhood, and the garden and study of his old house. He returns there from the new house built with academic prize money, and ponders the experiences of his young friend Tom Outland, lost in World War I.

"Tom Outland's Story" shifts to the American southwest, where Tom and another cowboy find ancient ruins in the Blue Mesa--a story based on the actual discovery of the Mesa Verde cliff dwellings. Tom's altruistic concern for the exploration and preservation of the ruins is ignored by ambitious Washington bureaucrats and betrayed by the profit-oriented assumptions of his friend, Roddy Blake. In the third section, "The Professor," St. Peter's musing on Outland's story leads him to literally "find himself," in an imagined encounter with his younger self. The realization that he can no longer live with his family is followed by a near fatal accident, in which the professor lets go of "something very precious." Afterward he takes Augusta, the family's middleaged Catholic servant, as his model for living out of duty rather than passion, and is able to face his family and the future.

Students usually enjoy reading this novel but are puzzled about its relevance to "American places" until we begin to discuss it in class. The importance of places for the story soon becomes obvious, if it wasn't before: Godfrey St. Peter's tale is told with houses, lakes, villages, canyons, and the contrasts of staid midwestern college town, stuffy bureaucratic capital, and windswept southwestern mesa. Students see the positive and negative places--the old house, lake, and mesa on one hand, and the new house, daughter Rosamond's new mansion, the university, and Washington on the other. Also evident are Cather's technique of describing positive places in detail but referring only vaguely to the negative ones, and the impact of the abrupt jumps from Hamilton to the Blue Mesa to Washington and back. When pressed to explain the "meaning" of Cather's story, however, students hesitate. They feel it has something to do with the professor's identity crisis, but aren't sure how the places relate to that.

More information is then introduced into the discussion through lectures, films, or student research reports, raising topics for further consideration. I will describe briefly here the various approaches I use, any one or more of which helps stimulate critical thinking and greater appreciation of the novel and of the importance of "place." I cannot go into details, but will indicate the sources of the insights I have found helpful in understanding Cather and *The Professor's House*. I usually try to see that three issues are raised: 1) the relationship between the author and the novel's character; 2) her use of the history of the discovery of Mesa Verde; and 3) her comments on the writing of the novel.

First, it is useful for readers of *The Professor's House* to know that Willa Cather's acute sensitivity to space and intense attachment to particular places were important in shaping her personal identity. The recent biographies of Cather by James Woodress and Sharon O'Brien document this. O'Brien asserts that "Willa Cather's struggle to establish an independent personal and literary self was also a search for a psychological, social, and geographical space where she could 'dissolve into something complete and great' without being dissolved" (70). Professor Godfrey St. Peter is not simply a veiled self-portrait of the author, but it is evident that Cather put a great deal of herself into the character, and students find the parallels between them illuminating.

Among the parallels are similar families, childhood removals from cherished environments, and adult returns to the childhood region. Cather moved from Nebraska to Pittsburgh, closer to her early home in western Virginia, to take an editorial position; St. Peter chose the university in Hamilton because "any place near the lake was a place where one could live" (31). Throughout her life Cather searched for places where "one could live," and she depicted that quest in the professor's story. The parallel is especially clear with regard to the professor's study: it duplicates the attic sewing room in the Pittsburgh home of Cather's close friend Isabella McClung, the room in which Cather did her first work as a professional short story writer.

Biographer Woodress reports that Cather called *The Professor's House* a grim little tale written in a middle-aged mood, and it seems legitimate to assume that Godfrey St. Peter's thoughts and emotions reflect what Willa Cather was feeling at least part of the time while she was writing his story (367). This matters for an understanding of the novel only in the sense that we take the professor, his problem, and his solution to it more seriously when we assume that they reflect a personal crisis in Cather's life, and the resolution she found for it. That brings us to the subject of the geography of *The Professor's House*.

The use of a southwestern site as a place with special significance for an individual can also be traced to Cather's personal experience. She grew up with stories of the discovery of ancient cliff ruins in Mesa Verde in the 1880s. Several of her early stories dealt with characters affected by encounters with the southwest, and "The Enchanted Bluff" of 1909 was based on her childhood response to the Mesa Verde story. It was Cather's first actual visit to Arizona in 1912 that marked a turning point in her professional life (O' Brien, 403-420). She returned to New York and began writing the novels based on her Nebraska childhood that brought her literary fame. In one of them, *The Song of the Lark*, an artist (singer Thea Kronberg), whose private refuge as a child in a midwestern town is an attic room, comes to self-understanding in a southwestern cliff dwelling (O'Brien, 85,403-420). Cather visited the southwest again in 1914, 1915, and 1916, and "rediscovered" it after a decade in 1925. She then came across the story that would be the basis of her popular 1927 novel, *Death Comes to the Archbishop*, and returned the following year to do more research. "Although the Southwest was only the catalyst for creative and psychological processes already under way, later Willa Cather viewed the region as her artistic birthplace.... The region remained a permanent feature of her emotional and imaginative landscape" (O'Brien, 417, 419).

On her 1915 trip Cather visited the nine-year-old Mesa Verde National Park and heard the story of the exploration of the mesa from a brother of discoverer Richard Wetherill. Writing to a friend about her adventure of being lost overnight, Cather declared that "she was ready to go back and be mauled again by the big brutality of Cliff Canyon. She never had learned so much as in the twenty-four hours of that experience. That country, she said, drives one crazy with delight"

(Woodress, 264). Cather's companion Edith Lewis thought Cather "was intensely alive to the country--as a musician might be alive to an orchestral composition he was hearing for the first time... one felt that she was deeply engaged with it always, was continually receiving strong impressions from the things she saw and experienced" (265). Given this relationship to the southwestern landscape, it is obvious that Tom Outland's response to the Blue Mesa, appropriated by the professor through his empathy with Tom, reflects Cather's response to what she calls "those long, rugged, untamed vistas dear to the American heart" (*Professor's House*, 270).

More insight into the meaning of the professor's story is gained by considering Cather's use of the history of Mesa Verde's discovery. White settlers in the Mancos River valley of southwestern Colorado had long been aware of the ruined cliff dwellings in the area, and of the profits to be made from selling artifacts and escorting visitors. By the early 1880s appeals for legal protection for area ruins had been made to, and ignored by, the Colorado legislature. In 1888 Mancos rancher Richard Wetherill, with brothers and a friend, discovered extensive unknown ruins deep in the canyons of the mesa. "Ancient Journeys," David Drew's public television series on archeological discoveries, includes a good show on Wetherill's efforts to become a competent archeologist. Wetherill also hosted Swedish archeologist Gustav Nordenskjold, who helped him map the ruins and, like everyone else, left with a large quantity of artifacts. The Wetherills contacted the Smithsonian Institution about purchasing their collection or sponsoring further excavation. That underfunded and overextended organization, however, did not respond to their requests (Smith, 22-23). Careless treasure hunters damaged the ancient structures by digging and blasting. After a vigorous campaign by concerned Colorado women, Mesa Verde was made a national park in 1906, the first to preserve human artifacts rather than a natural area. In 1908 Smithsonian scientists took over the exploration and preservation of the cliff ruins.

Shortly after her 1915 trip to the mesa, Cather described the ruins and her reactions to them in an article for *The Denver Times* (reprinted in Rosowski and Slote). This article "is 'Tom Outland's story' in embryo," and demonstrates that Tom's story fused the facts of Wetherill's discovery with Cather's emotional response to the mesa (Rosowski and Slote, 91). In her novel Cather simplified events to clarify the important issues, and the changes tend to emphasize the greed of those involved in the discovery of the mesa, and to highlight the contrast of an ideal ancient culture with modern American society.

Cather's article says nothing negative about Wetherill or Nordenskjold, and reveals the empathy she felt with Wetherill because of her personal discovery of the beauty and mystery of the mesa. But in the novel, reactions to Outland's Blue Mesa are somewhat different. Tom obviously embodies Wetherill's, Nordenskjold's, and Cather's sense of discovery and awe, as well as the Swede's respectful scientific approach to the ruins. But Tom is the only person in the story except the professor who sees the cliff dwelling that way. Cather oversimplifies the diverse attitudes toward the preservation of southwestern ruins, so that what was in fact widespread public apathy becomes, in the novel, the irresponsible self-aggrandizement of ambitious Washington bureaucrats. She builds on the real hostility in Colorado to Nordenskjold's removal of relics, turning him into a German--significant after the world war--and an unscrupulous foreign looter of American historical treasures. The greatest betrayal comes from Roddy Blake, who wants the best for Tom but can conceive of that only in material terms. By emphasizing the mercenary motives of those involved with the mesa, Cather aligns them with the professor's materialistic family. Tom and the professor stand alone in transcending the acquisitive impulse.

The 1916 article does not comment on greed, but it does idealize the original inhabitants of the mesa in terms repeated in the novel. Both accounts describe the cliff dwellers as "a superior people," with "a distinct feeling for design" (*Professor's House*, 219). These ancients "were absolutely unenterprising in the modern American sense. Their architecture and their religion were their national purpose. Their religion was largely a personal recognition and interpretation of nature. They seem not to have struggled to overcome their environment. They accommodated themselves to it, interpreted it and made it personal; lived in a dignified relation to it. In more senses than one they built themselves into it" (Rosowski and Slote, 82; *Professor's House*, 221). That this positive response to the ruins of the southwest was in part the product of a negative reaction to modern American culture is evident from Cather's 1916 observations: "On the way from New York to the Montezuma valley one goes through hundreds of ugly little American towns, but when you once reach the mesa, all that is behind you. The stone villages in the cliff arches are a successful evasion of ugliness--perhaps an indolent evasion. Color, simplicity, space, and absence of clutter, the houses of the Pueblo Indians today and their ancestors in the Mesa Verde are a reproach to the messiness in which we live" (Rosowski and Slote, 84). Environmental awareness, antimodernism, and the organic architecture of Frank Lloyd Wright all echo here, as does the assumption of late-nineteenth-century archeologists that advanced ancient cultures were unrelated to the more primitive modern American Indians (in the novel, "our roving Navajos" are implicated in the demise of the cliff culture) (Trigger; Patterson; *Professor's House*, 219, 221).

The haunting remains of this ideal human culture draw Tom, during his summer alone on the mesa, into a deep identification with the place and its shapers. "This was the first time I ever saw it as a whole.... It was possession.... For me the mesa was no longer an adventure, but a religious emotion. I had read of filial piety in the Latin poets, and I knew that was what I felt for this place. It had formerly been mixed up with other motives; but now that they were gone, I had my happiness unalloyed" (250-251). It is in pondering Tom's relationship to the mesa that Professor St. Peter is brought into a new relationship with the Kansas boy he had once been, "the realest of his lives"

(264). "He was not nearly so cultivated as Tom's old cliff-dwellers must have been--and yet he was terribly wise. He seemed to be at the root of the matter; Desire under all desires, Truth under all truths" (265). It is by the contrasts between others' mercenary attitudes toward the mesa and Ton's religious experience there, between the sophisticated materialism of the professor's world and the natural primitivism of his true self, that the author's message is conveyed.

In a 1938 letter to a friend Cather explained that *The Professor's House* was the product of two experiments in form, attempts to reproduce in a novel the effects of "the device often used by the early French and Spanish novelists; that of inserting the *Nouvelle* into the *Roman*," and of musical sonatas "in which the academic sonata form was handled somewhat freely." She continued with an image perfect for a course on places:

> Just before I began the book I had seen, in Paris, an exhibition of old modern Dutch paintings. In many of them the scene presented was a living-room warmly furnished, or a kitchen full of food and coppers. But in most of the interiors, whether drawing-room or kitchen, there was a square window, open, through which one saw the masts of ships, or a stretch of grey sea. The feeling of the sea that one got through those square windows was remarkable....
>
> In my book I tried to make Professor St. Peter's house rather over-crowded and stuffy with new things; American proprieties, clothes, furs, petty ambitions, quivering jealousies--until one got rather stifled. Then I wanted to open the square window and let in the fresh air that blew off the Blue Mesa, and the fine disregard of trivialites which was in Tom Outland's face and in his behavior. (*On Writing*, 30-32)

From her biographers we know that Cather felt increasingly uncomfortable with the modern society of the 1920s. In this novel it seems that she questions the values of her society, not by preaching against them, but by creating in the reader's mind pictures of places: a blue lake, a beloved old attic room, the silent cliff ruins of a culture in harmony with its natural environment.

There are numerous interpretations of *The Professor's House*, of the professor's "problem" and Cather's solution to it. Depending on the critic, St. Peter does or does not represent the author; his/her despair is real, inexplicable, or self-induced; it is the result of unrealizable homosexual love, pervasive greed or middle-age; he/she ultimately fails, commits spiritual suicide, or is reconciled with life, We discuss the various conclusions in class, and I usually defend Rosowski's and Slote's reading: the professor is able to accept his present and future because of his discovery of his past self--just as Tom discovers a meaningful past--and because he has Augusta as an example of a life upheld by ritual--just as the cliff culture was a ritualistic one. In the 1916 article Cather wrote of the ancients:

> One has only to go down into Hopiland to find the same life going on today on other mesa tops; house like these, kivas like these, ceremonial and religious implements like these--every detail

1322

preserved with utmost fidelity. When you see those ancient, pyramidal pueblos once more brought nearer by the sunset light that beats on them like gold-beaters' hammers, when the aromatic pinon smoke begins to curl up in the still air and the boys bring in the cattle and the old Indians come out in their white burnouses and take their accustomed grave positions upon the housetops, you begin to feel that custom, ritual, integrity of tradition have a reality that goes deeper than the bustling business of the world. (Rosowski and Slote, 86)

The Professor's House was Cather's attempt to tell a story, or stories, that would evoke in her readers the same feeling. It was an effort to take them, like Ebenezer Scrooge led by the Christmas spirits, to places so startlingly different that their own places could be seen from new perspectives. The novel is about mid-life crisis, self-discovery, greed and spiritual malaise; it is also about the ways in which ideas shape places and places affect our lives and our selves.

Cather's novel comes up repeatedly throughout the rest of the course, as we consider attitudes toward the land, urbanization and suburbanization, frontiers and communities. In reading it students have encountered different North American regions (midwest and southwest), different attitudes toward places (reverent and exploitative), the symbolic use of place (lake, study, houses, Washington, mesa), and the importance of specific places for individuals (lake and study for St. Peter, the mesa for Tom). Not all of this needs to be dealt with at length for the book to be effective, and there are still other topics to explore if one desires. Cather's novel is a rich work that could be used for different purposes and in different ways in almost any educational setting. It certainly has proved to be a stimulating and flexible introduction to the variety of issues arising from a consideration of "American places."

MEMORIALS: THE PUBLIC AND PRIVATE DOMAIN

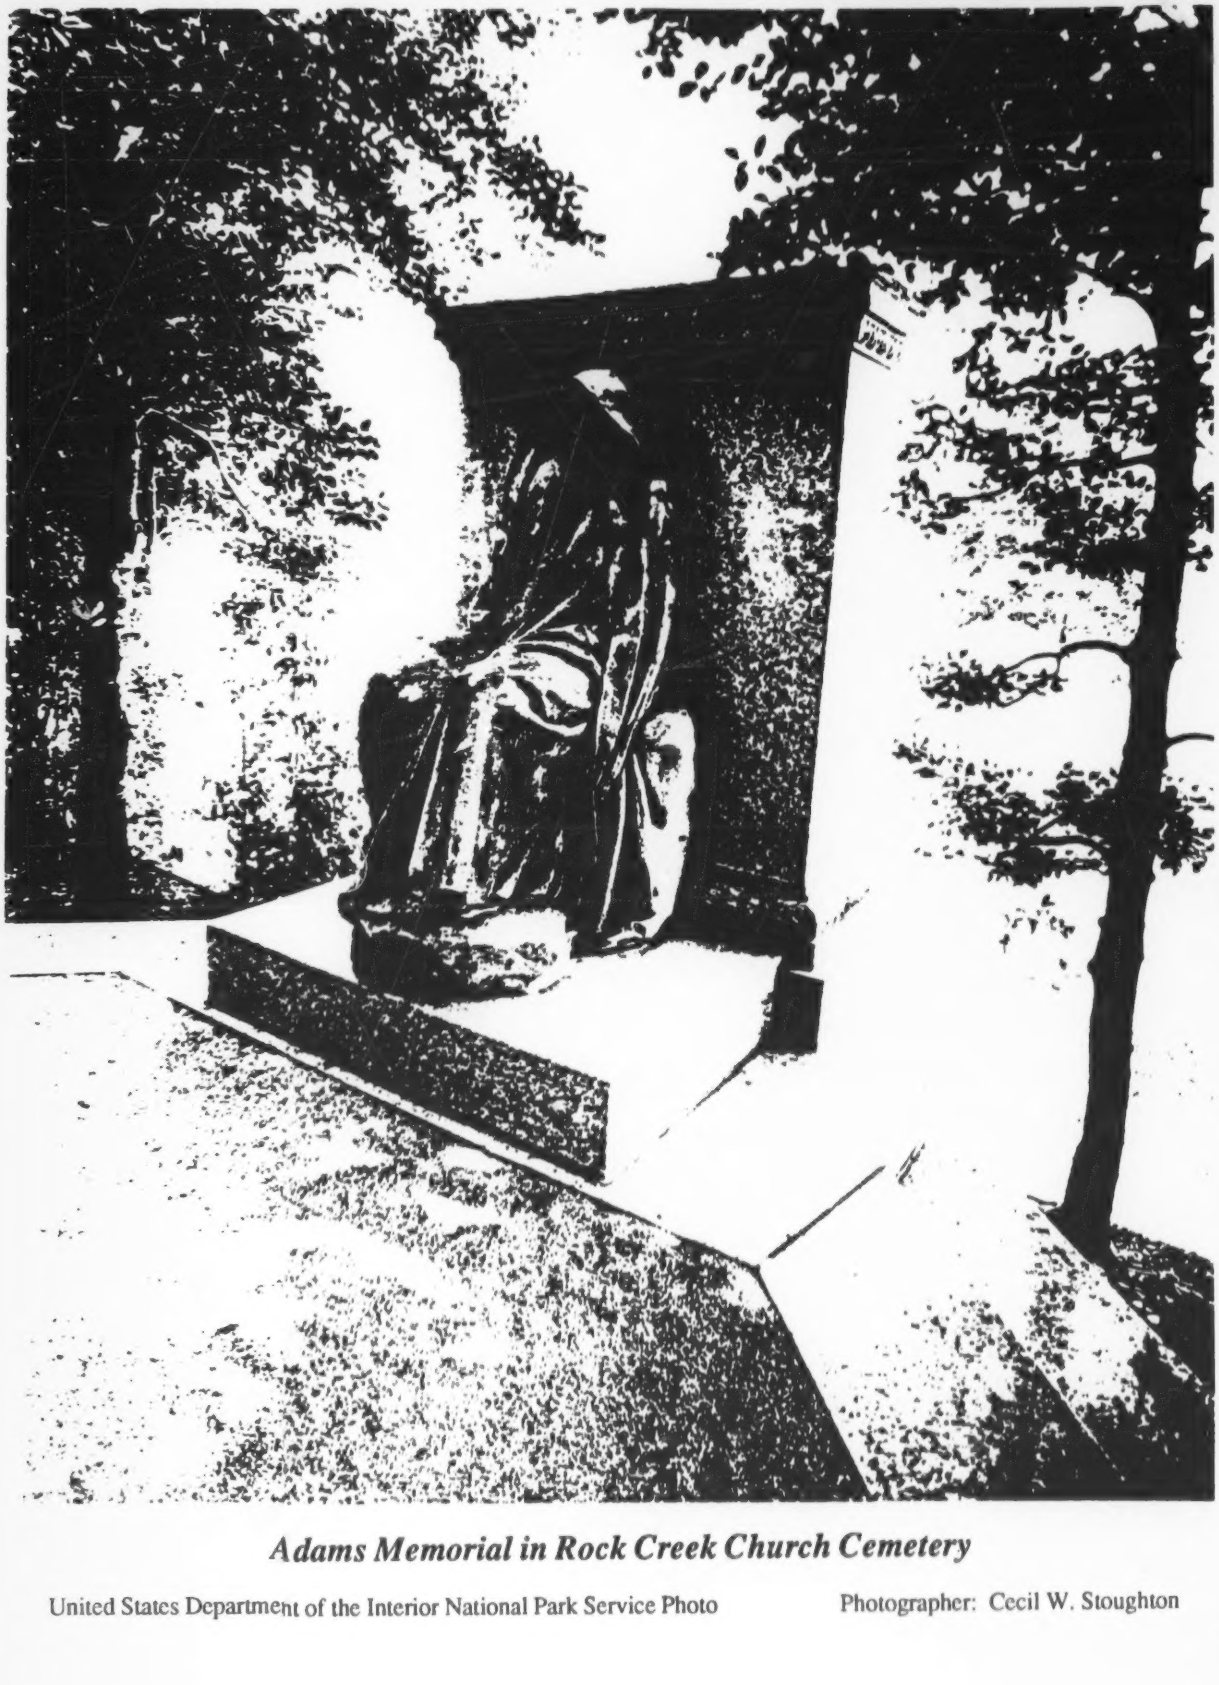
Within five miles of each other, in the confines of the nation's capital, exist two memorials, similar yet different, grand, yet simple. Secluded in a grove of holly trees in Rock Creek Cemetery sits Augustus Saint-Gaudens' masterpiece, *The Adams Memorial*, commissioned in 1886 by the scholar, historian and journalist Henry Adams as a tribute to his deceased wife, Marion Hooper Adams. On the Mall, in a much more public and spacious environment is *The Vietnam Veterans Memorial*, May Lin's black granite tribute, dedicated in 1982 to honor the men and women who gave their lives in that conflict. Each memorial speaks of American culture from a time and a place. They are universal in their ability to get viewers to examine themselves and their lives.

One does not have to come to Washington, D.C., to find monuments and memorials which captivate the mind and imagination. Americans living in the smallest of towns and communities have also erected their own monuments and memorials to commemorate people and events. The lesson activity here described is centered on *The Adams Memorial* and *The Vietnam Veterans Memorial*. Students who engage in this activity are high school juniors enrolled in my American Civilization (American Studies) course. I live and teach near Washington, D.C., with its wealth of memorials; other teachers can adapt this activity to fit their own locale. Educators will need to utilize local resources, cemeteries, and historical societies. Additionally, teachers will need a camera to take slides or photos to share with their students. I purchased slides of the Augustus Saint Gaudens monuments from Saint-Gaudens National Historic Site in Cornish, New Hampshire, and shot my own slides of the *Adams Memorial* and the *Vietnam Veterans Memorials*. If you wish to focus on memorials of national prominence, you can use an ektagraphic copy stand to make slides from the photographs in the books listed in my bibliography, or you can use an opaque projector to share these pictures with your classes. Plan on devoting four class periods to this project.

MASTERY OBJECTIVES:

At the conclusion of this unit students will be able to:

1. Understand the impact of public and private memorials on society.
2. Define public and private art.
3. Discuss why public art is significant in a democracy.



Adams Memorial in Rock Creek Church Cemetery

United States Department of the Interior National Park Service Photo Photographer: Cecil W. Stoughton

4. Recognize the different environments that memorials enhance.

5. Understand the challenges that face the public artist.

6. Realize that buildings or parks can also be a form of public art.

7. Understand that society needs public and private memorials to remember people and past events.

8. Appreciate the variety of memorials that exist throughout the American landscape.

9. Create their own public or private memorials.

DAY ONE

I begin my unit by defining public art. I explain to my students the importance of public art in a democracy. I highlight this by telling them about my trip to the Soviet Union and my examination of public art in that country. Quickly I point out that public art in the Soviet Union primarily celebrates three things, Vladimir Lenin, Karl Marx, and The Soviet Fatherland. Furthermore I explain that these monuments have only existed since the Russian Revolution and the 1920s. It is important that my students recognize that in the United States Americans celebrate the diversity of this nation in many ways and I discuss with students the fact that in a democracy a variety of groups, ideas, and opinions must be satisfied. Students should recognize quickly that the American public artist assumes a great risk when creating a memorial, structure, or space because the artist must speak for the entire nation or community. Consequently, the sharpest critic of the public artist will be the people of the nation or community for which the work was created.

At this point I show slides of various examples of public art, such as:

- *The Minuteman* and *Lincoln Memorial* by sculptor Daniel Chester French

- *The Boston Public Library* designed by the architectural firm of McKim, Meade, and White

- *New York Central Park* designed by landscape architect Frederick Law Olmstead

- *The Brooklyn Bridge* designed by engineer John Roebling

- *Mount Rushmore National Monument* by sculptor Gustam Borglum

- *Saint Louis Gateway Arch* by architect Eero Saarinen.

Students consider that public art is not necessarily a statue or sculpture, but can be a building, a structure, or a space that the public can occupy.

DAY TWO

I begin by providing a brief lecture on the background of *The Vietnam Veterans Memorial* in Washington, D.C. I discuss the story of the design competition and the controversy over the final design. I poll students to see how many have actually visited the memorial, asking them to explain their reactions to it. What did they think of it? How did they feel when they first saw it?

Then I show slides of the memorial. Students respond to the following questions as they look at the slides:

- Is funerary art an appropriate form of public art? Explain.

- Do war memorials have to be designed in the form of human figures? Why or why not?

At this point I stop the slides and discuss the addition of the Frederick Hart statue and the proposed addition of the statue of an Army Nurse. I explore with students the addition of the Hart piece as a means of settling the original design controversy and the women's statue proposed to accommodate this special interest group. Following this discussion I show slides of the Hart statue and ask them to read editorial letters from the *Washington Post* that respond to the proposed women's statue. Students are asked to think about the following:

-Does the addition of the Hart statue add anything to the original design of the wall? Why or why not? Explain.

-Should the proposed statue of an Army Nurse be placed near the wall? Why or why not? Explain.

Finally as the class draws to its conclusion I show a final set of slides of the New York City *Vietnam Veterans Memorial.* For homework students answer the following questions:

-Which *Vietnam Veterans Memorial* are they more attracted to? Why?

-What different emotions does each memorial evoke? Explain.

-How do the surrounding landscapes (The Mall and Office Buildings) affect each memorial? How do you think the designers took these environments into consideration when planning each memorial?

-In 100 years how will Americans view the *Vietnam Veterans Memorials?* Why?

DAY THREE

I begin this class by collecting the previous night's homework for evaluation. Then I move into a brief lecture on the life and works of the sculptor Augustus Saint Gaudens. I discuss the impact of Saint Gaudens on American public art, explaining to students that America in the late nineteenth century was creating much public art. Many memorials commemorated Civil War events and heroes. I tell the students that America was going through a healing process after the war; these memorials helped to heal the wounds caused by that conflict. I ask students to think, too, about the healing impact of the Vietnam Memorials. At this point I present slides of Saint Gaudens' Civil War memorials *(The Admiral Farragut, Abraham Lincoln: The Man, The Robert Gould Shaw,* and *The General Sherman)* and examine with students how these memorials reflect the post-Civil War United States. I then focus on what many consider to be Saint Gaudens' masterpiece, *The Adams Memorial.* I explain to students the mystery of the *Adams Memorial*, telling them how Henry Adams wanted no name or inscription on the memorial and that Saint Gaudens was to leave the figure untitled. In addition, the figure was to bear no likeness of Marion Hooper Adams. Over the years many people have tried to name the figure (e.g., *Grief* and *The Peace of God*) and have visited this memorial to draw strength from it. As First Lady, Eleanor Roosevelt would visit the memorial during times of personal and national crisis.

Then I show slides of *The Adams Memorial*, being sure to include details and closeups of the facial features. I tell students that Saint Gaudens had both men and women pose for the memorial and that legend claims the figure's nose is actually Saint Gaudens' signature. I explain to students how the memorial is landscaped within a private, natural outdoor enclosure of holly trees. This outdoor "Room" was designed by Saint Gaudens' close friend, architect Stanford White. The slides I use include this landscape arrangement. After students have viewed the slides I assign them some essay questions due the next day and present questions for discussion at the beginning of the next class. These are the essay questions:

- If you could title *The Adams Memorial* what name would you give it? Explain.

- Reflect on this quotation from Henry Adams regarding *The Adams Memorial*: "Saint Gaudens held up the mirror and no more."

- What is the meaning of the mystery behind *The Adams Memorial*? Explain.

- How does the landscape of the "Room" created by the grove of holly trees add to the atmosphere of the whole piece? Compare this with your observations on the more public *Vietnam Veterans Memorials*.

DAY FOUR

I begin class by collecting *The Adams Memorial* essay. With the whole class I discuss their responses to the essay questions.

As a culminating activity I assign students the following long-range project on public and private memorials. I call this project: *A Personal Memorial Tribute*. I tell students to pretend that after having lived a good life in service to their nation and community they have died. To honor them, the nation or community has decided to erect a public memorial to their efforts. Based on all that they have learned in class from this unit students are to create their own memorial to their lives. I tell them that they must be positive in their outlook and approach. At this point I model for them a memorial that I would like to have built in my honor. This memorial would be located on a cliff overlooking the ocean. Allegorical figures representing "Joy" and "The Humanities" flank the lamp of knowledge, symbolic of my life as an educator. Surrounding the white marble base are red, green, and white flowers, representing my Italian lineage. The inscription on the memorial reflects the things I am most proud of in my life and it includes goals that I still hope to reach before I die. I encourage my students to base their design on what they hope to accomplish by the end of a long, productive life. They can create their memorials out of any medium. Some students use clay, while others use wire or poster board. On the day that I collect the memorials students submit on a separate sheet of paper the following information:

- the dimensions of the memorial;

- where the memorial will be placed and a statement of why the memorial is there; this should include a discussion of the environment and landscape;

- a brief explanation of the design;

- a projected cost of the memorial;

- a description of the materials used to create the memorial;

- a statement which justifies the memorial.

Generally, I give the students two weeks to complete this assignment. They are advised that they will share their memorials with their classmates after I have evaluated them. Results in the past have exceeded all my expectations; I have been moved by the students' accomplishments. This project not only provides me with the personal satisfaction of teaching about something I value--public art--but it confirms my belief that teenagers do have ideals and in many ways are concerned for the good of humanity. Some of the Personal Memorials have included tributes to physicians who have found the cure for cancer, whiie others have memorialized social workers, nurses, and parenting.

Because direct experience of memorials proves much more impressive than a slide, I encourage my students to visit the various monuments and memorials located in the District of Columbia. I enjoy giving up a Saturday to take interested students into town to look at the monuments, and I make certain that the *Vietnam Veterans Memorial* and the *Adams Memorial* are on our itinerary.

A new building or park in your town could be substituted very easily for the monuments I have used in this unit. Contact the local historical society or department of parks to find out what treasures exist in your own backyard. Take your students to visit these places or motivate them to explore them on their own time. If a picture is worth a thousand words, perhaps a statue or memorial is worth even more.

GREAT CITIES IN HISTORY: AN AVENUE TOWARD THE COMPARATIVE STUDY OF CIVILIZATIONS

How can we get students--many of whom still retain the late adolescent ahistorical vision of their own and their society's uniqueness--to see their own culture in some kind of historical perspective? I would like to suggest that one way to approach the problem is through the comparative study of civilizations. This approach can, however, be an intimidating experience for students. Confronted with multi-volume works by heavy thinkers such as Spengler, Toynbee and Sorokin, even the most motivated might well be daunted. Yet by analyzing complex societies existing at different times and in different places, we can gain greater understanding in at least three areas: 1) how civilizations originate and evolve; 2) similarities and differences between specific historical cultures; 3) a vision of ourselves as unique in some respects, but also as one of many civilizations, shaped and influenced by those of the past.

One possible strategy focuses on some of the great cities of the world, particularly in their roles as hearths of civilizations at different periods in history. Cities and civilizations have, of course, been intimately interrelated ever since their first appearance in Mesopotamia around 3500 B.C.; the two words even derive from the same root, the Latin *civitas*. In his article "The Urban Revolution," archaeologist V. Gordon Childe explicitly linked the rise of large population centers characterized by various criteria--such as monumental architecture, social stratification, trade, writing and mathematics--with the phenomenon we call civilization.

Cities thus provide a useful focus in a number of different ways. For one, they are, as I have already suggested, the places in which civilizations first appeared and flourished; they are not only centers of population, but also of culture and innovation. It would be impossible, in any case, to discuss ancient Greece without dwelling upon Athens, or Roman civilization without dealing with the city of Rome itself; so to some extent such a focus is a natural and inevitable one. Second, most aspects characteristic of civilizations are to be found in their great cities, particularly art and architecture. Third, cities--to a greater degree than the civilizations of which they are a part--represent a comprehensible whole. Most cities before the 19th century, although immense compared to a rural village, were relatively small in both size and population; neither classical

Athens nor Renaissance Florence, for example, had populations larger than 100,000. According to Lewis Mumford, "early cities did not grow beyond walking distance or hearing distance." Finally, great cities such as Athens, Paris, Rome or London have a distinct and unique character, reflective of their specific environment, history and culture, which makes them attractive and interesting objects of study.

I recently used this approach when I taught a course called "The Idea of Civilization: Great Cities in Literature and History." The course had two major components: an introductory section dealing with general aspects of cities and civilizations, followed by the study of five specific cities and civilizations: prehistoric Ur, classical Athens, Renaissance Florence, 19th-century London and modern Los Angeles. In the first part of the course, we discussed the nature of urbanization and civilization largely in theoretical terms. We began by considering various concepts and definitions of terms such as "culture," "civilized" and "civilization." We then looked at comparative historians of the past such as Vico, Ibn Khaldun, Morgan, Marx, Spengler, Toynbee and Kroeber. It became clear that there was great diversity in how civilizations had been studied and particularly in how the results of those studies have been interpreted. We confronted some "big questions" here: how and why did cities and civilizations originate? What is the relationship between environment and culture? Is there a pattern, such as rise and fall, that all civilizations adhere to?

One question I particularly wanted the students to consider and so raised periodically throughout the course was "what does it mean to be civilized--both in general terms, and at particular times and in particular places?" It was instructive, for example, to compare civilized and non-civilized societies in various respects. We discovered that in addition to some obvious differences such as scale and complexity, there are some concomitants of civilization and city life that are less apparent. Although we commonly identify civilization with such glories as the Parthenon and the *Mona Lisa*, we are perhaps less likely—immediately at least—to associate it with social stratification and intensive aggression or competition, most egregiously exemplified in warfare. Similarly, when students think of great cities, they rarely think about rampant overcrowding, lack of sanitation and the prevalence of disease.

Since cities are, as Mumford pointed out, containers for the multifarious activities of a civilization, I tried to cover as many of these aspects as possible, including politics, economics, religion, social structure, technology, art, architecture and literature. Taking this broad, integrative perspective has obvious hazards, particularly a tendency toward superficiality, and this is, of course, also one of the major criticisms of comparative history itself. To some extent such an approach may be unavoidable if one is attempting to fill in the big picture at the expense of details; after all, the individuality and distinctness of a particular place and time are to be found precisely in such specifics. On the other hand, if we want not only to gain an overall image of a certain civilization or city--a snapshot in time, as it were--as well as to compare it to others, it may be necessary to sacrifice some depth. An alternative strategy, however, would be to restrict the scope of inquiry to areas such as art, literature and religion, acknowledging a certain incompleteness or more limited focus. In my course, I chose a middle path, trying to be broadly comparative while at the same time identifying the specific characteristics of each city and civilization.

With each city/civilization, we began by looking at its environment and the ways in which that environment shaped and was shaped by the developing culture. In ancient Ur, for example, it seemed apparent that the dry, treeless Mesopotamian plain necessitated an extensive irrigation system in order for cities to exist, which in turn influenced Sumerian civilization in a number of significant ways: reliance on the gods and their priests to insure and regulate the flow of life-giving water; endemic conflict over access to circumscribed resources; a world view emphasizing conquest of and control over the natural environment. After considering the setting, we then turned to the history and development of the city and civilization before taking up more specific aspects. We concluded our examination of each time and place by trying to define its character and legacy to other civilizations.

As I suggested earlier, I think the comparative aspect offers a number of advantages. One is not necessarily bound to follow a strictly chronological sequence (although it is useful, for example, to note the influence of classical Greece and Rome on Renaissance Florence). A focus on similarities and differences between cities and civilizations simultaneously draws the student in two directions: toward regularities which may characterize many or all similar societies and toward an appreciation of those qualities which make a great city distinctive. Thus my students tried on the viewpoints of both the social scientist, seeking larger patterns over time, and the humanist, concentrating on the particularities of text or painting. They also came to see life in their modern megalopolis--with its diversity, its consumption-induced stresses and its squalor amidst plenty--as similar to and yet technologically and qualitatively different from major cultural centers of the past.

EXPERIENTIAL LEARNING MEETS HUMANITIES EDUCATION IN THE STREETS OF NEW YORK: TEACHING "NEW YORK—THE CITY AS TEXT"

"A great city is a profound challenge to the impulse to make one's own interpretation of reality universal ... "

-Thomas Bender, *New York Intellect,* 5

Bender's words proved to be prophetic for the groups of midwestern college students I have brought to New York City in the context of a course entitled "New York: The City As Text." Their notions of reality were tested and retested in every domain of experience from the arts to ethnicity, from their definition of the good life to their notions of social evil, from their views of themselves and their peers to their relations with other races, cultures, and viewpoints.

Background

Interdisciplinary courses which utilize the city as text are burgeoning throughout American colleges (Braid and Raia). These courses represent the confluence of six trends characteristic of American education as we approach the 1990s. First, renewed interest in interdisciplinarity is evident after a decade of eclipse during which traditional disciplines dominated (Fish). Second, educators nation-wide are beginning to embrace experiential, interactive, and collaborative methods of learning and teaching and the values they represent. Third, deconstruction and reader-response theories have led educators to re-examine and to broaden the definitions of *text* and *aesthetic object* and to accept cultural relativism and indeterminacy in meaning (Crowley). Fourth, the national educational agenda now includes multiculturalism, environmental issues and student involvement in public service (Gabelnick). Fifth, media attention to the acute plight of the homeless and inner cities challenges the academy to walk outside its doors and take an active role in solving problems of our society. And sixth, students who previously pursued study abroad are inhibited by increased costs due to the devalued dollar and problems with international security. They are opting instead to broaden their horizons by exploring America.

College Honors programs have spearheaded the development of city as text courses. At the 1989 National Collegiate Honors Council Conference, one-third of the sessions were devoted to city as text curricula. Increasingly, however, such courses are also appearing in a wide range of educational settings to challenge non-Honors students, including remedial, reluctant, and nontraditional learners.

In the context of an Honors Program at a midwestern college, I was asked by the Honors director to develop a course on "New York: The City As Text." My training was in interdisciplinary humanities education, although I was teaching composition and literature courses within an English Department. I was already a practitioner and advocate for experiential and collaborative learning. And I was a former New Yorker who used New York City as a text throughout my training at New York University in Greenwich Village. I agreed without hesitation, despite a realistic sense of the risks inherent in traveling with college students, especially to New York. It turned out to be the most gratifying, albeit challenging, educational experience of my career in teaching and one which students continue to lavish with praise and gratitude as the "most important course" they took in college. I subsequently taught this course a second time the following year with some modifications and with even more enthusiastic results. The course described here draws primarily upon the second of these experiences.

Here, at last was an opportunity to give full expression to my commitment to experiential learning (learning by doing) and interdisciplinary humanities education. Yes, I would take students to New York City, but once there I would move beyond passive learning in a lecture format, even if those lectures could take place within the awe-inspiring walls of the Metropolitan Museum or St. Patrick's Cathedral.

Students would learn about dance in New York, but it would not be by watching a polished performance in an uptown theatre. They would experience dance close-up, interacting with dancers as they created and refined their art. They would attend a rehearsal of a young dance troupe meeting in the social hall of an aged Settlement House on the Lower East Side. Within arm's length of the dancers, students would hear and feel the floor vibrate and see the muscles strain as the dancers developed the choreography, stopping to argue shades of difference in arm position and beat. And later, students would get to ask the dancers questions, hearing how these young people make ends meet by waiting tables and driving cabs just to stay in New York—the center of dance in America.

Students would not simply see works of art in galleries and museums, they would also visit with a reknowned Japanese American artist in her studio loft in Soho. There they would sit on the paint-spotted floor of a cavernous room, surrounded by immense canvases, some crated for delivery to a gallery show, others in the process of development, others unsold, and still others in early draft form in a variety of media. There students would ask her about how she goes about her work. They would hear how she paints daily despite nausea from paint and chemical fumes or lack of inspiration, negotiates commissions, and copes with the challenges of her conflicting Japanese and new American identities. And they would see first hand why artists love the old cast-iron buildings of Soho with their open spaces, high ceilings, and large windows which flood the rooms with light.

Students in this course would learn about the art scene, both artistic and commercial, by playing the role of art buyers. I would give them a hypothetical $2,000 each with which to "consider buying" a favorite work of art in the galleries of Madison Avenue, 57th St., or Soho. Students would be expected to browse, identify works they loved, ask gallery owners or attendants about these works, about the artists, and about the price and the potential art market value of the works. And if that work was a signed and numbered lithograph, they would inquire what that meant. They would also be asked to share with other students a description of their favorite work, why they chose it, and what they had learned about their taste in art. They would also convey tales of gallery owners who would not unlock the doors to let them in and others who gave them personal extended tours of the gallery exhibits, offering them descriptive literature on schools of art and how specific works are made.

Students would go to an opera at the Metropolitan Opera House, but first they would take a backstage tour of the Met, provided by the Opera Guild. In that city within a city, they would visit mammoth carpenter and electrical workrooms; wig, costume, and makeup shops; rehearsal rooms, rotating and elevated stages, computerized lighting boards, and the orchestra pit. And when the curtain would rise for them on *La Boheme*, students would understand and appreciate the complexity and scale of the achievement.

It would have been sufficient to take them as tourists to New York, systematically visiting the places starred in the *Michelin Guide*. But to do so would have been to deny all that I knew about the efficacy and significance of experiential learning and teaching. It was a golden opportunity, and I was going to explore its limits.

Structure of the Course

The course consisted of eight weekly seminar sessions on campus before an eight day stay in New York City over Winter Break. Three additional sessions were held after our return: one for debriefing, one for course and trip evaluations and discussion of their papers, and one for a social gathering (with New York cheesecake, of course).

Seminar sessions were three hours long. This permitted sufficient time for movies about New York City (*Wall Street, Hester Street*), small group collaboration and presentations, and discussion of weekly seminar topics. These ranged from New York history and architecture to factors which influence response to the arts. The movies were used to reinforce themes and to help students visualize the environment they would be entering. For many young people from the midwest, the scale, the pace, and the crowds in NYC can be overwhelming and disorienting. Movies were an effective way to prepare them for what they would see and experience and to envision, for example, immigrant life behind the aging tenement facades on the Lower East Side.

The model of experiential learning advocated by D. Kolb proceeds in four stages: 1) Provide students with background skills and information, i.e., "tools with which to observe and analyze the effects of experience" (i.e., weekly seminar sessions). 2) Provide students with direct or concrete experience in a real life situation (i.e., trip to New York City). 3) Concurrent with the concrete experience, provide students with frequent opportunities to share their observations and reflections in oral and written form (i.e., daily debriefing sessions to share our experiences and daily journal entries of their reactions and emerging views). And finally, 4) provide students with an opportunity to rethink and revise their abstract concepts and generalizations (i.e., a culminating paper exploring what the student had come to understand about New York City and himself/herself). (Sharan and Sharan, 21)

My emphases in the course, including seminar topics, readings, assignments, methods of assessment, and itinerary in New York, reflected 1) my training in the arts and ethnicity; 2) what was available in NYC in March; 3) the backgrounds of my students; and 4) last, but not least, budgetary constraints.

I began by asking myself what I wanted students to experience and to understand as a result of this course. New York is akin to a highly complex Rorschach test to which each person reacts in highly personal and often idiosyncratic ways. New York would be our text, but each of us would bring to this dynamic place different ways of looking at the world; and in the course of eight days, each would experience a different New York. In their free time, students would pursue different activities. Even in the experiences we did share, we would perceive different things. I would have truly limited control over this educational environment, and it was best to confront and accommodate that in my planning form the outset. I would build in a core of experiences, both readings and activities in New York, which we would all share, with the understanding that an equally significant part of the course would be individualized.

My students themselves had special needs. Most of my twelve students had never been outside southeastern Michigan, nor had they been to a large city, not even Detroit. Most of them knew little of art, music, or theater, although they valued them in the abstract as elements of cultural awareness and intellectual prowess. They had limited exposure to ethnic or cultural diversity, and many were frank about their prejudices and intolerance of otherness. They were part of the cohort of traditional white lower middle class students of the 1980s, caught up with a blend of materialistic, professional goals and a vague but untested sense of social concern. They saw New York City as the center of culture and commerce in America and as gateway to the world beyond the confines of home, campus, and mid-America. And most of them, despite fears of safety, cost, and airplanes, were champing at the bit to try life in the Big Apple.

I was eager to make New York accessible to them, but it was clear that no set of facts would prepare them for what they were about to experience. The curriculum would have to be conceived in other terms. I concluded that my primary tasks were to help them to function safely and independently in an urban environment and to look at New York from a wide range of perspectives. They would need the ability to observe, to ask relevant questions, and to analyze the effects on themselves of their experiences in response to the arts, the urban environment, and the unplanned, unexpected aspects of our journey.

The result was a three credit course which focused on the following topics:

-NYC as a center of the arts and commerce: a mega-city.

-Overview of NYC history: relations among geography, commercialism, democracy, tolerance, ethnicity, education, intellectual life, and the arts.

-NYC and the American Dream.

-NY Personality Syndrome: creative, risk-taking, competitive, tolerant of difference, questing for uniqueness and excellence.

-Ethnic diversity and patterns of assimilation and group identity; contributions to the arts; relations among ethnic groups today.

-Cultural diversity.

-Identification, development, and analysis of each student's taste in the arts.

-The effects of context in response to the arts, e.g., Do you respond differently to works displayed in a gallery, a museum, an artist's studio, on the street?

-Form and function in the arts, e.g., Does the shape of the Guggenheim Museum as architecture serve its function as a museum to display modern art?

-Architecture in NYC; public art.

-The impact of an urban environment on us, e.g., How do crowds make you feel?

-The media in NYC: journalism and television.

-How would an urban anthropologist look at NYC?

-Urban development: economics, employment, gentrification, schools.

-NY politics: the mayors.

-Human Services in NYC: the homeless, the poor, the roles of city, state, and federal governments.

-Coping in NYC: Practical information—geography, transportation, safety, dining, budget, planning for the trip.

Assignments

1. Journal of the trip with daily entries and a critical analysis (8-20 typed pages) of the insights and issues raised in the journal and the course, exploring what students had come to understand about NYC and themselves.

2. A small group presentation tracing the arrival and assimilation patterns of one ethnic group in NYC, e.g., Italians, Irish, Jews, Blacks, Hispanics (primarily Puerto Ricans), Chinese, New Wave Asians—Koreans, Vietnamese, Japanese.

3. Analyses of any six articles from a coursepack of readings and four media assessment forms in response to one or more issues of the Sunday *New York Times, The Wall Street Journal, The New Yorker*, and *The Village Voice.*

4. Daily assignments associated with NYC activities:

Ex. 1: You have been given $2,000 to buy an art work for yourself in the galleries of Madison Avenue or Soho. (Sorry, the money is only pretend.) Find the art work you most want. Inquire how it is made; about the artist and his/her school of art, if any; how art of this type is priced and what determines its value. Be prepared to share with the group a description of the work, why you like it, and what you have learned about your own taste in art.

Ex. 2: (For our visit to the Metropolitan Museum of Art) Explore the art of at least three different eras or cultures and try to identify the major concerns or interest of those cultures from their works. Work in pairs or small groups.

Ex. 3: Try at least two ethnic foods (in ethnic restaurants) which you have never eaten before. Try to identify aspects of the ethnic culture beyond the food which are present in the restaurant, e.g., language (both oral and written), decor, method of service, dress, formalities, the diners, etc.

Ex. 4: Optional activity—attend a religious service of any denomination or religion *other* than your own, e.g., St. Patrick's Cathedral, St. John the Divine, Trinity Church, Abysinnian Baptist, Temple Emanuel, Holy Trinity Greek Orthodox.

The Itinerary in NYC

The time in NYC was divided into three categories of almost equal weight: 1) tourist sights, including all cultural events; 2) speakers or visits with individual New Yorkers; and 3) free time or optional activities. To plan the itinerary, I divided each day into three time blocks of morning, afternoon, and evening activities, making an effort to leave free time each day in one of those three blocks. However, little free time was provided during the first few days of the trip when students felt dependent on me for their safety and selection of things to do and to facilitate group cohesiveness and community. As the week progressed and students gained a sense of independence, they were eager for time to explore, shop, visit friends, or return to places of great interest. I also tried to include popular attractions (Metropolitan Museum, Greenwich Village) early in the trip so they would have time to revisit them later in the week.

During free times, students were required to go in pairs or small groups or to take cabs to specific destinations if they were alone.

Some decisions were determined by budgetary considerations. I tried to take advantage of free or reduced entrance fees offered at specified times. To save time and money, I tried to cluster activities by location.

Selection of Activities

NYC offers so many quality museums that I decided to focus on the museums themselves as places to experience art. I selected museums to maximize contrast, pairing a visit to the modern Frank Lloyd Wright structure of the Guggenheim Museum with the Frick Museum, housed in an elegant neo-Renaissance turn of the century mansion. I contrasted the neoclassical interior of the stately Metropolitan Museum with the stark, well lit rooms of the Museum of Modern Art. Students would also visit commercial art galleries along Madison Avenue and Soho, where they would peruse the small but intriguing Museum of Holography and an artist's loft.

In the performing arts, my criteria for selection included diversity and how available the activity would be at home in Michigan. Although we have access to theatre and concerts, we rarely have access to musicals and opera. Therefore, we went to musicals on Broadway (*Les Miserables* and *Phantom of the Opera*) and Off-Broadway (*The Fantasticks*) and to the Metropolitan Opera House to see *La Boheme*. We explored dance by attending a rehearsal followed by a question and answer period with a small modern dance troupe.

We had studied the ethnic groups to prepare us for our walks through Chinatown, the Lower East Side, Little Italy, Black and Spanish Harlem, and our visit to the Statue of Liberty. But we did not have to go far to interact with peoples of all nations. Every corner had a Korean green grocer, and cab drivers and waiters were inevitably immigrants.

To explore commercial New York, we went to the opening bell at the Stock Exchange, to the garment center for a talk with a furrier who worked his way up from poor immigrant to successful entrepeneur, and to the public television station (PBS) for a tour and talk with the one of the producers of the Great Performances Series about the problematic relations between federal funding and artistic freedom.

There were other sights, some of them optional, including the Museum of Natural History, the South Street Seaport, Central Park, Trump Tower, the Cloisters, the U.N., Madison Square Garden, Bloomingdale's, and Zabar's (the ultimate in delis). Kids who love views enjoyed the World Trade Center and the Empire State Building. For night life, students loved Greenwich Village and rock and comedy clubs. Many students wanted to attend "Saturday Night Live," but tickets were sold out 1 1/2 years in advance. Had we gone during the summer months, we might have taken the Circle Line Tour around Manhattan and visited the Bronx Zoo and The Brooklyn Botanical

Gardens. The new Museum of Immigration on Ellis Island is due to open shortly.

To evaluate the course and the trip, students were asked to rate every seminar topic and every activity in NY. The activities with the highest ratings (Very Worthwhile) were the Metropolitan Museum of Art, *Les Miserables,* the visit with the artist in her Soho loft, and the final group dinner in Chinatown. Many students commented that visits with individual New Yorkers provided a critical dimension to the trip. They offered a human link that made NY into a place where people live and work, create and consume culture and recreation. Those New Yorkers spoke to us without fees of any sort, giving generously of their time and experience, providing students with models of passionate commitment, hard-work, and creativity.

Debriefing Sessions and Group Dynamics

Every morning the group met in my hotel room for a daily debriefing session. This time was well spent. We discussed details of the day (although they had been given three copies of the itinerary in detail). Students also organized their free time activities by asking others who would join them, taking turns at making arrangements for specific events. Most important, we discussed what we had done the previous day and how people felt about all aspects of their New York experience. Inevitably students were confronted by how differently others perceived events we had shared. This was the time when students re-examined their characteristic ways of responding and interpreting their experiences. This was the place in which they discussed challenges to their long held biases and vision of reality.

Students discussed issues which troubled them, especially their ambivalence toward the homeless for whom many felt pity and concern, anger and fear. Students got a chance to blow off steam ("Dr. DeZure, you walk too fast!"). And they had a chance to begin organizing observations into tentative generalizations ("I came here expecting New Yorkers to be rude and uncaring, and every place I go, they are friendly and helpful. They do walk fast and talk fast, but if you ask for help, they couldn't be nicer." "It seems like everyone I meet was originally from someplace else. It isn't like home at all." "The New Yorkers we've met say that living here is too expensive and a hassle, but they love it so much they wouldn't consider moving. They think it is the center of the universe in so many ways.")

The group meetings were a time to share feelings. It gave us a chance to bond as a group. No one else would quite know or understand what our experience had been. And, of course, it was a time to suggest highlights to others: be it a "neat" rock group, a cheap place for a decent Italian dinner, or a science fiction bookstore.

The first and last meals of the trip were eaten family style (by reservation) in Chinese restaurants. The first meal thrust us into group living with each of us tasting what everyone else ordered while sitting knee to knee, crammed around a table meant for eight instead of thirteen. By dessert on our first night, we were a community. Our final meal in Chinatown lasted three hours while each of us recounted our most memorable, hilarious, weird, frightening, and inspiring moments. Ethnic cuisines were a significant part of our trip, one that contributed immeasurably and joyfully to our expanded vision of cultural diversity and our own group identity.

Cost and Budget

With the exception of my teaching salary for a three credit course which was covered by the Honors Program, students bore the entire cost of the trip, including my flight and expenses in NYC. In addition to their tuition, students pre-paid $650.00 to cover flight, lodging (2-3 per room in a good midtown hotel), all entrances and tickets to required activities, lectures and tours, and ground transportation to and from the airports. Students also paid for their food (approximately $15.00 per day), transportation in NYC ($30.00), texts (coursepack of readings and the *Michelin Guide to NYC*, about $25.00), and optional activities and expenses. Students felt that they had gotten an incredible amount for the money despite the fact that most of them paid for the trip out of money they earned themselves. The price was right.

Conclusion

In their final papers, students wrote of their pride in experimenting with so many unknowns, of feeling "intellectual" and "cultured" for the first time in their lives. Some described the joy of loving a work of art or the wonder of entering the fictive world of *Les Miserables*. Some despaired at the thought of going home where the pace is slower and life is far less exciting; others welcomed a return to open spaces and a sense of security. Most vowed to return; all of us felt that we had changed for the better and grown in countless ways. Thomas Bender was right. New York had focused us to see the world differently by helping us to understand how differently others see it.

Deborah DeZure

LECTURESHIPS IN HUMANITIES
WAYNE STATE UNIVERSITY

The Department of Humanities, Wayne State University, invites applications for two one-year lectureships. Both appointments will start on August 28, 1990 and run through the academic year 1990-1991.

Applicants will be expected to possess the following qualifications:

1. Ph.D. (preferred) or M.A. (required) in inter-disciplinary humanities or comparative arts plus prior teaching experience in inter-disciplinary humanities and/or comparative arts (preferred); OR

2. Ph.D. (preferred) or M.A. (required) in a specific humanistic or arts discipline plus prior teaching experience in inter-disciplinary humanities and/or comparative arts (required).

3. Preference will be given to candidates with demonstrated competence in at least two of the following areas: music, the visual arts (including architecture), literature (including poetry), and philosophy/history.

Duties and responsibilities include:

1. Teaching introductory-level and intermediate-level courses in inter-disciplinary humanities and/or comparative arts.

2. Assisting in curriculum development and preparation of instructional material.

3. Participating in some extra-curricular activities.

4. Performing related duties as assigned by the department chair.

Applications and inquiries should be addressed to Martin M. Herman, Chair, Department of Humanities, Wayne State University, Detroit, MI 48202. Applications must include: (1) a letter; (2) a current curriculum vitae; and (3) the names and addresses of three references.

The deadline for submitting applications is June 1, 1990.

Wayne State UniversityWayne State University is an Equal Opportunity/ Affirmative Action Employer.

Summaries of significant reports about interdisciplinary humanities education.

PARIS PAINTED

T.J. Clark, *The Painting of Modern Life: Paris in the Art of Manet and his Followers.* Princeton: Princeton UP: 1984; paperback 1986. 118 black-and-white ills.; 30 color plates xv + 338 pp. Paperback, $12.50. Reviewed by Roger Johnson, Jr., University of Southern Mississippi.

The volume at hand is not a current book requiring initial reaction and critique. There has been time for the dust to settle, the sides to be drawn, and longer-term evaluation to begin. (For a competent, positive review, see Marilyn Brown's remarks in *Art in America* 74, Jan. 1986, 1, 21-23; a thorough, somewhat more critical review is that of John House, *Burlington Magazine* 128, Apr, 1986, 296-97.) Now that *The Painting of Modern Life* is available in cheap and popular format, there is a need to assess the book's value for humanities education at the undergraduate level. The present review is directed to this end.

The first point to make is that the book should not be and is not being ignored, but there may be a tendency for undergraduate scholars and their teacher to categorize the study too narrowly as art history. The subject of the book is indicated in its subtitle, *Paris in the Art of Manet and His Followers*, not *The Art of Manet and His Followers.* No serious study of French society or culture during the second half of the nineteenth century nor any thorough analysis of modernism can afford to avoid Mr. Clark's analysis. Whether reactions are positive or negative (and most are positive, if perhaps reluctantly), this book is now the sun around which many inquiring planets wander. The belle epoque, under Clark's Marxist glare, has lost some of its glitter; but it has gained clarity in the light of Clark's new articulation of its shortcomings and achievements. The book is therefore, for many educational efforts, both helpful and necessary at some level--as text, assigned reading, assigned reading for selected students, or background for teachers.

The book consists of an introduction, four main chapters, and a conclusion. Clark's initial task is to introduce the reader to a set of four terms crucial to his central notion that "the form of the new art is inseparable from its content" (5). The "content," by the way, is "those 'objective forms of bourgeois recreation in the 1860's and 1870's'" (5, citing Meyer Shapiro). The terms are *class*, *ideology*, *spectacle*, and *modernism*. The definitions are both ingenious and essential. Class or, more precisely, social order is fixed "most potently by representations or systems of signs" (6). Ideology is a "set of limits to discourse" (8). Spectacle is not an Aristotelian term but rather a concept indicating the "progressive shift within production towards the provision of consumer goods and services, and the accompanying 'colonization of everyday life'" (9). "Modernism," we are warned, "is used here in the customary, somewhat muddled way." It describes something that "happened in the history of art around Manet," a change involving skepticism or unsureness "as to the nature of representation in art" (10). The definitions (to which I cannot do justice in summary) are not casual, and they are certainly not concise. They are, however, consistent; and the reader must be advised to keep a finger in the introduction while proceeding through the book.

The first chapter, "The View from Notre-Dame," focuses on the Haussmannization of Paris and paintings that reflect that process, chief among them Manet's *Exposition Universelle de 1867*. There was a desire, according to Clark, to visualize the change Paris was undergoing and, more generally, to "have the modern city be an image" (66). One of Manet's effects was to unsettle the meaning of emerging images. "Olympia's Choice," the second chapter, provides a reading of *Olympia* but, more abundantly, an exhaustive scrutiny of contemporary reactions to the painting. Clark's now somewhat notorious note 8 (a two-pager in reduced type) is, in itself, an astonishing contribution to scholarship. He begins, "In the following list of criticism and other items on the 1865 Salon, I have attempted to be as complete as possible, though there are some omissions and loose ends" (281). There are over seventy entries that deal with Manet or *Olympia*, of them four that Clark designates "deliberate and good" (282). Particularly interesting are the absences of reaction in certain quarters.

"The Environs of Paris," the third chapter, seems to me the best choice for those seeking to read an excerpt in place of the entire book. Clark focuses on Manet's *Argenteuil, les canotiers* and includes a great deal about the paintings of other artists, particularly of Claude Monet. These considerations take place within a context of Clark's description of the emergence of leisure as a kind of performance among members of the lower-middle class. "A Bar at the Folies-Bergere," the fourth chapter, is about popular culture, especially the cafe-concert, and Manet's brilliant, difficult last painting, which is replete with inconsistencies "so carefully contrived" that Manet must have felt them "to be somehow appropriate to the social forms [he] had chosen to show" (252). This chapter, like the third, might be read as a free-standing essay, although perhaps with more distortion (because of isolation) of Clark's general assumptions/conclusions, which are expressed at the end of the chapter: 1) What was "visible in modern life" was not character, but class. 2) The culture erected obstacles to understanding this fact. 3) For the artists, the obstacle constituted an ideology, namely, "that modernity was no longer characterized by a system of classification and control but, rather, by mixture, transgression, and ambiguity in the general conduct of life" (258). Clark's "Conclusion," on the other hand, makes little sense without the foregoing text. It is not a conclusion in the sense of a summing up, but rather an analysis of Seurat's *Dimanche apres-midi a l'Ile de La Grande Jette*, wherein Clark finds "ways in which class might still be painted" (261) and a clear delineation of the "limits of modernity" (267).

Although I have suggested that parts of *The Painting of Modern Life* might be read as essays, students of humanities would obviously be better served to take it whole, a condition in which the book's status as cultural and, especially, social history is evident. Taken in parts, the book's greatest value is its reading of various individual works of art and its refinement of critical terms that have in some cases come to be cliches—*flatness*, for example. Almost any section, but especially the third chapter on *Olympia*, can serve as coherent commentary on the history of art criticism.

This is a patiently assembled book, and reading it requires the patience to wait for Clark's argument to illuminate the subject, something that does not happen while the reader is skimming or under pressure to extract a timely comment. Most especially, the book does not reveal its value lightly to anyone seeking art history in the sense of a narrative that provides aesthetic context to a movement. Indeed, there is almost nothing here of the world of art, nothing of Japonisme, for example. There is, on the other hand, plenty of theory, although it is not presented as such. John House remarked in the review mentioned above that Clark has tackled a "central problem of writing about art: how to relate the discussion of visual forms with questions of meaning" (296). *The Painting of Modern Life* does not contain a solution to the problem but is, rather, a solution. It is not, however, a solution that lends itself to abstraction and general application; this is no how-to book. The theoretical bases are alluded to with a measure of irony; and the text is studded with rhetorical questions; long and short ellipses; and organizational paragraphs that often fail, on a careful first reading, to shed light on even the structure of subsequent passages.

In short, this is not an easy book; but it is an immensely rewarding one. To place it without commentary on an undergraduate reading list for a general course would be to set a booby trap. Both the book and students deserve better.

HOMOGENIZED ANOMY

Out of Place: Restoring Identity to the Regional Landscape by Michael Hough. Yale University Press: New Haven, 1990 (211 pp; 174 ill) $35.00. Reviewed by Fred E. H. Schroeder, University of Minnesota, Duluth..

As the subtitle indicates, a primary audience for this volume is professional planners, but as the *double entendre* of the main title hints, Michael Hough is a most engaging writer. Urban and suburban landscapes world wide are "out of place" in the sense that they all resemble—what? New York City? Houston? One another? Lack of identity has become such a universal problem that not only can we transpose office towers, condos, airport-strip high-techopoli, and malls from one place to another without either loss or gain in identity, but we no longer know what the home place is for this anonymous pattern. Any European or Third-World citizen would call it Americanization, but Americans are victims themselves. "Out of place" is also the solution to anomy; planners and the people they serve must learn how to recognize the factors that have given a place its identity, and then, out of the understanding of the place, strategies can be developed to restore its identity.

Hough, who is a professional landscape architect and a faculty member at two Canadian universities is almost an ideal person to write *Out of Place* because he has intimate memories of so many places: he lives in Toronto, grew up in Istanbul, studied in Edinburgh, has been a consultant in Hong Kong and on Baffin Island, played as a child on his uncles' carnation farms on the Cote d'-Azur, has helped plan landscapes for malls, parks, streets, roads and freeways, and most of all seems to experience any place, urban, rural or wilderness with heightened awareness of all five senses. The book begins with "Images of Places Remembered," a personal travelogue. From here he distinguishes between "pedigreed architecture" and "vernacular architecture." Pedigree, he says, "is the outward and formal manifestation of the way a culture perceives its identity," and one of its characteristics is "the use of materials that have no connection with the local site" (17-18). Like Versailles, which resembles nothing of local geography, flora or economy, pedigreed architecture can yet express and punctuate local identity. The vernacular, however, is out of *the* place. Basically, this is founded on the native landscape, imperatives of the given rocks and rills, lakes and hills, climate and prevailing weather patterns. The factual data are filtered through enculturated eyes, though. The landscape is not what is *there*, but what we *perceive* as there.

Moving from the native landscape to the cultural landscape, Hough also sees regional identity as a product of necessity, not planning. The towns, villages and cities that charm and intrigue us by their uniqueness are "the result of having to deal with the realities of the time. In the absence of the technological means to flatten hillsides, this inevitably led to what we see as a sensitive adaptation to site, and a forthright use of materials and building techniques" (47). There is, of course, the problem that the indigenous population cannot perceive their uniqueness, making them vulnerable to imported and imposed regional "identities," the sort of thing that utopian planners and commercial developers specialize in. Self-recognition is not easily learned.

Possibly we can only be shocked into such self-recognition by harsh necessity. Hough provides several successful case studies: Tucson's water-crisis that made it realize that it was a desert; Ontario's budget crisis that made it look for cheaper ways to maintain highway rights-of-way; Manteo, North Carolina's realization that tourism investments could destroy all that they held "sacred," Baffin Island Inuit's realization that loss of identity with their harsh landscape was ruining their minds and bodies. Throughout the book there is a haunting fear that disastrous crisis may be the necessary imperative worldwide to end the thoughtless advance of homogenized anomy. Hough hopes not, and urges us to turn our minds from the despair of the huge problems of global self-destruction to the places where we *can* turn things about, for we don't need *humanity's mind* changed as we need *people's mind* changed. His principles: Know the Place. Maintain a Sense of History. Promote Environmental Literacy. Do as Little as possible (i.e., eschew utopianism). Make the Landscape Sustainable. And, Start Where It's Easiest.

Out of Place is not a book of American culture, but its global range reflects profoundly on what has been wrought by the application of American practices of environmental ethics and western dicta of utopian planners. Both practically and theoretically *Out of Place* also provides ways in which we can understand our regions, our communities and ourselves more clearly, more thoughtfully and more responsibly.

HUMANITIES JOB MARKET

HUMANITIES PROFESSOR: Requires a Master's degree in a humanities field with emphasis in fine arts. College teaching experience is preferred. Position open until filled.

Collin County Community District, located north of Dallas in the cities of McKinney and Plano, Texas, is a rapidly growing College celebrating its fifth anniversary. Current faculty rank among the top community college faculty in their disciplines nation wide. This position is the result of continued growth.

Qualified applicants submit current resume/vita, graduate transcripts and letter of interest to:

COLLIN COUNTY COMMUNITY COLLEGE DISTRICT
HUMAN RESOURCES DEPARTMENT
2200 WEST UNIVERSITY
MCKINNEY, TX 75070

EQUAL OPPORTUNITY EMPLOYER

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity**, **humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:
- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

A DIALOGUE WITH NATURE
PART II

George Morrison
American, 1919-
***Collage IX: Landscape*, 1974**
Wood
The Frances E. Andrews Fund 75.24

A member of the Grand Portage Chippewa Band, George Morrison was born in a rural Minnesota town on the North Shore of Lake Superior, a location he still considers his spiritual center. On that rugged shore, in rock formations, stones, driftwood, and plant life are found the infinite shapes, colors and patterns that Morrison builds into dazzling classical essays on the art of composition. Although the works created across his now forty-some years of production differ vastly in material and technique, all have in common the artist's lifelong involvement with the natural world and with human beings' principal point of reference to the universe, the horizon.

It is a necessary referent for Morrison's pieces which, subtly colorful and abstract, are hard to pin down until one turns to Lake Superior, with its fleeting, all-over colors and the clear razor-cut at the horizon. The horizon "is like the edge of the world," Morrison has said. Artistically, "It's the dividing line between water and sky, color and texture. It has an extensity that relates it to the broader range of the universe. I like the range of color that's constantly changing, that's never the same. I like to look at it...I've heard other people say that they don't see the lake all the time, but they're aware of it, and when they go on vacation, they miss the lake." Morrison has carried the lake all through his life--first to Minneapolis, then to New York and the East Coast, then Europe and back again to his present home on the North Shore.

Although Morrison does not consider himself an "Indian artist," he feels that his heritage plays a large part in his work, particularly as Indian culture relates to the natural world. The influence is especially clear in his notebooks where, from one page to another, a realistically drawn bluff transmutes to an abstracted pattern, which becomes a page of looped lines, eventually to emerge as a wood construction. Morrison contends that this art form, which he developed in the mid-sixties, is an extension of painting, that he paints with wood rather than oil or acrylic. "The little pieces I picked up on the beach were like the shapes in the paintings. The old textures were already there: the crusty old grain in the wood. It was a made surface." It is easy to see why this form and method would suggest itself to an artist imbued from birth with a reverence and a "feel" for nature.

Morrison's relief painting departs from the 20th-century tradition of assemblage, however, with its emphasis on accidental and incongruous relationships. While Nature may shape and weather his materials to some extent, Morrison feels that the artist makes the final choices from within. Thus the first step in his working method is the determination of the horizon line, generally one-quarter of the way down from the top of the work. Then he begins laying out pieces from the lower left-hand corner, moving toward the one constant, known element in an otherwise continuous process of moment-to-moment choice.

Collage is a large scale embodiment (60 1/8 inches x 168 1/2 inches) of Morrison's theories and method. With one sweeping horizon and many smaller echoes Morrison organizes the apparent randomness of the natural world into a coherent visual system. He then combines the weathered textures of grayed wood with bright accents of red and blue to create visual interest and movement within an otherwise static composition. Despite its suggestion of great distance and spatial depth, *Collage* maintains a very human scale, a tension due in large part to the sensuous tactile properties of the wood. Thus Morrison celebrates the wholeness of order and chaos, instinct and intellect, the human and the natural worlds.

Camille Pissarro
French, 1831-1903
***Pluie, Place du Théâtre Français (Rain on the Square of the French Theatre)*, 1898**
Oil on linen
The William Hood Dunwoody Fund
18.19

Camille Pissarro's cityscape was painted late in his career, in the winter of 1898. In January of that year, Pissarro had gone to Paris and taken a room at the Hotel du Louvre on the rue de Rivoli, a location that offered him a splendid bird's-eye view of both the Avenue de l'Opera and the Théâtre Français. He stayed there until April, painting 32 views of the neighborhood at different times of the day and in various weather, always depicting the scene from a fresh angle.

By its very title, *Pluie* betrays Pissarro's Impressionist interest in the transient effects of light and atmosphere. It is painted with a luminous use of soft color, in short, brisk brushstrokes derived from the famous "broken" Impressionist style. Unlike other works from this group, however, which were often hastily composed, it is carefully constructed so that the rectangular solidity of the architecture becomes a foil for the bustling figures and traffic and the swaying trees. Pissarro has emphasized this contrast by creating a more detailed "portrait" of the buildings while rendering the moving vehicles and pedestrians in a sketchier flurry of brushstrokes.

With its unconventional view and asymmetrical framing, *Pluie* also reflects the influence on later-19th century art of the Japanese print and the photograph. Both of these new art forms were avidly studied by the Impressionists, who were inspired to incorporate the compositional effects they saw into their own paintings. The result was a flattening of pictorial space, emphasizing the two-dimensional nature of the canvas rather than the illusion of three-dimensional distance. Here, depth is indicated as much by Pissarro's placing of background objects at the top of the picture as by the conventional use of perspective. A second result of this study is the casual air of the composition itself, with its "unfinished" edges and figures cut off in the middle. It appears to be a spontaneous sketch, a snapshot taken at random. This is true to Pissarro's desire to paint an "impression" of the scene in front of him, one that was true to his optical experience rather than to his knowledge of what was there.

Pluie thus gives us an image of Paris caught in the rain--people with umbrellas scurry across busy intersections and huddle at street corners, while horse-drawn carriages click and splash their way along water-soaked avenues. Only the tan stuccoed buildings with their tin rooks and brick chimneys do nothing as the stone fountain gurgles in the square below and the bare trees quiver in the dampness.

Despite the greyness of the weather, the mood of the scene is not gloomy but rather conveys the pleasant excitement of a busy thoroughfare. The city seems alive and bustling with activity and energy. "It is very beautiful to paint!" wrote Pissarro. "Perhaps it is not really aesthetic, but I am delighted to be able to do these Parisian streets which people usually call ugly, but which are so silvery, so luminous and so vital."

Georgia O'Keeffe
American, 1887-1986
***City Night*, 1926**
Oil on canvas
Gift of the Regis Corporation, Mr. and Mrs. W. John Driscoll, the Beim Foundation, the Larsen Fund and by public subscription 80.28

Born and raised on a Wisconsin farm, Georgia O'Keeffe became interested in art at an early age and declared at ten that she would become an artist. She later studied at the Art Institute of Chicago, the Art Students League in New York, the University of Virginia and Columbia University. After graduation, O'Keeffe worked as an art instructor at the University of Virginia and in the public schools of Amarillo Texas. She found it difficult to adhere to traditional artistic formulas; modern art was more interesting to her, particularly the abstractions of Wassily Kandinsky. His idea that lines, colors and forms could be as expressive of beauty as musical notes liberated O'-Keefe artistically and she began to draw shapes while listening to music. From this point on, her private vision became the subject of her work.

In 1916, while O'Keefe was teaching in Texas, a friend took her drawings to New York and showed them to the prestigious photographer and gallery owner Alfred Stieglitz. His remark at first seeing them has become legend: "Finally, a woman on paper." Inviting her to move to New York, Stieglitz soon mounted a one-woman show of O'Keeffe's work in his Gallery 291 and then found a patron for her so that she could pursue her artistic career full-time. Other exhibitions followed and in 1924, after a show of 100 paintings that established O'Keeffe as an artist in her own right and not just Stieglitz' protegee, the two were married.

During the mid-1920s, O,Keeffe and Stieglitz lived in an apartment in the

Shelton Hotel, in mid-town Manhattan. From their windows on the 30th floor, they could see northwest to Central Park, east to the Queensboro Bridge and south to the Empire State Building. In the 1920s the skyscraper was a symbol of American enterprise, embodying the country's energy, inventiveness, power and wealth. Many artists became fascinated with the urban and industrial environment, painting skyscrapers, concrete constructions, grain elevators, factories and locomotives. Intrigued by the city, thinking of it as "something bigger" and "more complex than ever before," O'Keeffe began making views of the burgeoning metropolis, painting about 15 city scenes between 1925 and 1929. Many of these, like *City Night*, painted in 1926, were night scenes in which the tall buildings loomed like dark monoliths or presented ornate patterns of illuminated windows and spires.

At the same time as her soaring lines and precisely defined form suggest the dynamism inherent in the skyscraper, O'Keeffe's tolerance of city life was fundamentally uneasy and many of her Manhattan paintings give off a feeling of claustrophobia and of a choking absence of air. In *City Night* the towering walls are depicted as anonymous shapes devoid of human detail, emphasizing the viewer's sense of diminished stature below the sheerness of their vertical rise. The little white moon shining near the bottom of the picture appears completely overpowered by the cliff-like buildings, while the smoothly painted surface underscores the cold impersonality of the scene.

Reaction to O'Keeffe's New York paintings was negative at first. Stieglitz and the other artist in their circle suggested that she stick to the proper feminine sphere and paint nature since "even men" had trouble painting the city. O'Keeffe, not about to be told what to paint, went ahead anyway and was vindicated when in her 1926 show her first New York picture was the first painting to be sold. Still, O'Keeffe always considered herself "a country person" and in 1929 she stopped painting her cityscapes and made her first extended trip to New Mexico, visiting Santa Fe and Taos. The arid terrain, mountains and clear skies of the high desert suited her temperament perfectly, and she wrote home saying: "You know I never feel at home in the East like I do out here--and finally feeling in the right place again--I feel like myself—and I like it." From then on she spent several months a year there, and after Stieglitz' death settled permanently at Ghost Ranch, 16 miles northwest of Abiquiu.

Oskar Kokoschka
Austrian, 1886-1980
***Tower Bridge*, 1925**
Oil on canvas
Bequest of Putnam Dana McMillan
61.36.5

Born into a family of modest origins and finances, Oskar Kokoschka began his artistic career in fin de siecle Vienna, where, with his early portraits, he shocked its inhabitants by revealing the torment and tragedy behind the glittery gemütlich facade. Outraged by a public still living in the golden aura of outdated views of both art and politics, in 1909 Kokoschka left Austria for the more sympathetic climate of Berlin.

There, encouraged by the more forthright and aggressive example of the German Expressionists, he began to develop a style of almost savage power, in which both his subject matter and his drawing style were swept along with his feelings. Using bold, vigorous brushwork, emphatic lines and bright exaggerated color, Kokoschka sought to manifest on canvas his subjective reactions to the world of objective reality.

With the outbreak of World War I, Kokoschka returned to Austria and enlisted in the calvary. While in action at the Russian front he received serious head wounds that left him incapacitated for several years. By 1920, however, he was back in Germany as chair of the department of painting at the Academy of Dresden. There he reigned for four years as the star of German progressive circles when, seized with a sudden restlessness, he left his job overnight and embarked on a tour of Europe. Kokoschka's fascination with the nomadic life continued throughout his career, taking him to England, Italy, France and the United States (including a stint in the 1950s as guest instructor at the Minneapolis School of Art).

In 1925 Kokoschka made his first visit to London. Arriving in July, he stayed for only ten days and finished only one painting, *Tower Bridge*, a masterpiece of his early artistic maturity. In London the artist was particularly inspired by the Thames. "I think of the trenches in the First World War when I marched along that narrow walk with a wall on each side, absolutely confined," he recalled. "It is the contrast that made me love to paint the Thames, the distances, the sense of space, the freedom." Indeed, freedom is the real subject here, although the work is at face value only a bird's-eye view of a segment of the city. The horizontal format allows a maximum exposure of the rather highly placed horizon line, which seems to keep moving in both directions under the frame of the painting. There is a feeling of free movement in every direction. The eye can shift quickly from the rooftops in the foreground to the barges and bridge in the background. Kokoschka chose a high vantage point on the tenth floor of a building on the northeast side of London Bridge. The view downstream included the Pool of London, Billingsgate Market and the Custom House, the spire of Wren's St. Dunstan-in-the-East to the left and the Tower, all rendered rapidly and expressive of the excitement felt by the artist. His style here is at its most fluid, with paint applied as if it were watercolor, heightening the freshness and immediacy of the view. His brush charged with red, green or mauve paint, Kokoschka confidently caught what he called "the reality behind the appearance," with lines, dabs and patches of color. The vigorous brushstrokes convey the vitality of the port and the sense of pulsating activity along the wharves.

Kokoschka never returned to Germany or to his native Austria. His highly personal and emotive style of painting, and his liberal politics, soon drew the attention of the Nazi government and he was declared persona non grata. In 1939, together with the work of numerous other progressive artists, *Tower Bridge* was confiscated by the Nazis from its place in the Kunsthalle, Hamburg, and sold as "degenerate" art.

THE PHENOMENOLOGY OF PLACE

Romance does not creep along the ground; like the memorial to Washington, it reaches upward -- a silver thread uniting earth to the blue of heaven above.

Whitehead, *Symbolism*

The interpretation of a major cultural symbol like the Jefferson National Expansion Memorial [Gateway Arch] on the St. Louis riverfront, our tallest national monument, necessarily involves the study of American culture itself, an exceedingly complex and difficult undertaking. Unlike the small, homogeneous societies traditionally studied by cultural anthropologists, America is a modern, pluralistic society characterized by rapid social change. It is exceedingly difficult, therefore, to comprehend American life as a whole. However, a holistic understanding of American culture has been the historic aim of the American Studies movement.

In particular, the myth and symbol school of American Studies sought such a holistic understanding of American culture. This formidable group of scholars dominated the study of American culture during the 1950s and early 1960s. Although they produced highly original works of scholarship such as Henry Nash Smith's classic *Virgin Land*, their work was increasingly criticized for a number of intellectual weaknesses such as its over-reliance upon the written word as the key to American cultural values. John Kouwenhoven, a noted scholar of American material culture, made this point when he wrote, "the fact that we are heirs to much of England's culture, including its language, does not necessarily mean, as Constance Rourke long ago pointed out, that we have, like the English, expressed ourselves most fully in literature." Increasing resistance developed to generalizations about American culture derived solely from literature or other written sources. Few were still willing to believe that such a diverse society could be so easily characterized.

American Studies scholar Gene Wise suggested that the student of American culture focus upon what he termed "dense facts." According to Wise, dense facts are important persons, artifacts, or events that appear likely to reveal many of the links between various aspects of the culture in which they exist. Some of these links may include the consciousness of the individual artist or historical figure, the socio-economic structures in which the 'dense fact' exists or was created, or historical references and meanings. This emphasis upon "dense facts" suggests a perspective very similar to that of modern phenomenology. Several basic phenomenological assumptions provide the foundation for the study of a "dense fact" such as a national symbol like the Jefferson National Expansion Memorial.

Human consciousness is one of the central concerns of phenomenology. It has also been a major concern of American culture studies since Emerson's seminal 1837 "American Scholar" address. Pioneer American Studies scholar Perry Miller asserted that he had difficulty "believing that anyone can be a historian without realizing that history itself is part of the life of the mind; hence I have been compelled to insist that the mind of [humanity] is the basic factor in human history." This emphasis on the primacy of human consciousness certainly applies to the phenomenological study of American culture and cultural history.

The principal concern of the phenomenologist turns out to be the *intentionality* behind human behavior such as architecture and landscape architecture. Historian Warren Susman suggested that intellectual historians "would do well to see ideas in things and to see that there is in fact some connection between the most ethereal of ideas and common, even basic, human behavior." It is human intentionality that gives physical and cultural objects and places such as the Jefferson National Expansion Memorial the various meanings they can be discovered to have.

A classic example of the phenomenon of intentionality can be found in the field of urban sociology. Urban sociologist Herbert Gans lived in and studied the Italian ethnic neighborhood of West End Boston prior to a massive urban renewal project there that forced much of the community to relocate. On the basis of visual appearances, city officials and renewal planners had decided that the neighborhood was a slum and should be cleared for renewal. However, as Gans discovered through participant observation, the members of this unique community regarded their homes and the street life of the area very differently than did the city officials. The West Enders valued what they considered to be the vitality of public areas such as their streets, while many of the interiors of the buildings were well-maintained as settings for domestic life. Public officials had failed to seek a means of evaluation appropriate to the phenomenon under study: the meanings of the physical landscape to the inhabitants themselves.

This broad and dynamic notion of evidence especially applies to the phenomenon of a place such as the Jefferson National Expansion Memorial. "Place and sense of place," observed cultural geographer Edward Relph, "do not lend themselves to scientific analysis, for they are inextricably bound up with all the hopes, frustrations, and confusions of life." Thomas Jefferson's dream of a new and virtuous American Republic was always predicated upon his understanding of the vast American land, and important cultural historans such as Frederick Jackson Turner have traditionally regarded the American frontier as the crucible of American culture. Relph's comment, therefore, is particularly relevant to an analysis of a cultural symbol like the Jefferson National Expansion Memorial.

Historian of religion Mircea Eliade has argued that even the most desacralized modern cultures still contain places where that culture's most important values and traditions are embodied. Lenin's Tomb in the Kremlin Square of Moscow represents one such privileged space. Many of our most important American cultural values and expressions of identity are embodied in special places: the Statue of Liberty, Mt. Rushmore, the memorial to Washington cited by Whitehead in the epigraph above, and our largest national monument, the Jefferson National Expansion Memorial. Architectural historian Henry Glassie has trenchantly commented that "our American land, too, is an artifact... People, affectionate or rapacious, have made the land their expression, their testament and legacy... The American [land] incarnates history enormously. It speaks, incessantly babbling myth."

Anthropologist Claude Levi-Strauss frequently addressed the phenomenon of place in relation to the study of cultures. He wrote that "a native thinker makes the penetrating comment that all sacred things must have their place. It could even be said that being in their place is what makes them sacred, for if they were taken out of their place, even in thought, the entire order of the universe would be destroyed." The Jefferson National Expansion Memorial functions as such a privileged place for American culture. It was specifically designed by architect Eero Saarinen to give place to Jefferson's belief in Progress and America's westward destiny. Noted urban designer Edmund Bacon observed that "the decision has irretrievably been made to symbolically concentrate this entire force of westward movement as it crosses the Mississippi at one single point, the Gateway Arch." Recalling Relph's observation about the phenomenon of place, one can see that the Jefferson National Expansion Memorial, too, is bound up in American cultural values and attitudes.

One of the most instructive works about the phenomenology of place is *Genius Loci*, by architectural historian Christian Norberg-Schulz. Norberg-Schulz believes that privileged places such as the Jefferson National Expansion Memorial encompass all dimensions of human existence. In stark contrast to detached and reputedly objective analyses of environment conducted by the physical sciences, understanding of place as a total phenomenon necessarily encompasses the highly subjective dimensions of human cognition and intentionality. The human response to place is poetic as well as analytic. Edward Abbey's description of Delicate Arch in Utah provides an excellent example of *genius loci*, the phenomenon of place. "There are several ways of looking at Delicate Arch," Abbey writes; "You may see a symbol, a sign, a fact, a thing without meaning or a meaning which includes all things." Because of the enormous diversity that characterizes the human experience of place, Norberg-Schulz emphasizes the concrete experience of specific places in seeking to ascertain their meanings. Like historian Gene Wise, Norberg-Schulz stresses the importance of the "dense fact" in seeking to understand culture.

As Levi-Strauss clearly perceived, the phenomenon of place provides important clues to the values of its parent culture. American Studies scholar Jay Mechling contended that "the rules and cognitions associated with the natural environment are usually more central to the overall worldview of the society than are the cognitive structures associated with other subsystems." This view of nature was shared by Alfred North Whitehead, who regarded love of the sheer geographical aspects of one's country, its whole nature-life, as an important cultural binding force. In the minds of many Americans, this country was ordained as Nature's Nation; Jefferson believed that Providence had endowed America with enough land "for the hundredth and thousandth generation." From the time of Hector St. Jean de Crevecouer's *Notes from an American Farmer*, few cultures have devoted as much energy to explaining their relationship to nature.

Many American cultural historians, therefore, have regarded the phenomenon of place as a key to what Mechling termed an American ethnophysics, or world-view grounded in nature. Several paradigmatic works in the field of American Studies have focused on place and sense of place as essential to understanding American culture. Henry Nash Smith's *Virgin Land* examined how the American ideal of an agrarian society inhibited needed social responses to industrialization; *The Machine in the Garden* by Leo Marx examined the transformation of the pastoral ideal under the impact of industrialization in American life; Alan Trachtenberg's *Brooklyn Bridge: Fact and Symbol* compared American rhetoric about nature with the political realities of urbanization.

Scholars of American culture in other disciplines have also emphasized the phenomenon of place. Cultural geographer J.B. Jackson, for example, demonstrated how the township grid system established in the Northwest Ordinance objectified American Enlightenment beliefs about a rational, utopian society based upon farming. American novelist Willa Cather transformed the harsh realities of the American frontier experience into an American *Aeneid*. "Problematic though it may be," observed cultural geographer Erich Isaac, "the study of transformations of the landscape made upon ideological principles constitutes the major material for one who would study the religious motive at work in the cultural landscape of the present day." When a place has become as compelling as the Jefferson National Expansion Memorial, the viewer can be sure that it has become the repository of emotionally charged ideas and is being perceived as a cultural symbol.

The study of the phenomenon of place as a key to analyzing culture closely relates to Whitehead's concept of symbolism. The human mind functions symbolically when one component of its experience (the symbol) elicits consciousness and beliefs about other components of its experience (its meaning). Symbols like the Jefferson National Expansion Memorial are important vehicles for the communication of meaning. They function within their culture to objectify the important values and attitudes of the culture. In fact, philosopher Ernst Cassirer defined culture itself as the totality of the forms, or symbols, in which human life within a group is realized.

Places such as the Jefferson National Expansion Memorial are particularly important symbolic forms because of their high visibility and physical permanence. Architectural historian Siegfried Giedion noted that architecture can provide important insights into a culture because it is so bound up with the life of the period as a whole. Sir John Summerson extended this analysis even further as he declared that "the urban historian must not be primarily concerned either with administration or with the social, economic and industrial life of the city. He will have to intrude himself constantly into those fields to discover causes, incentives, and controlling factors but...the main issue, all the time, is tangible substance, the stuff of the city, and that implies form."

Thomas Jefferson was certainly aware of the importance of forms to a new and highly fluid American society. "It is desirable," wrote Jefferson, "to introduce taste to an art that shows so much." He built his masterpieces at Monticello and the University of Virginia to serve as models for the new Republic in the hope that his countrymen would derive a sense of purpose and order for their unprecedented historical experience by viewing these symbols.

American Studies scholar Cecil Tate suggested that this understanding of symbols as cultural forms provides the basis for a new and more complete American Studies method. Tate considered the method of myth and symbol analysis traditionally associated with American Studies as more than simply the rudiments of a methodology. He argued that it is the only approach that offers any hope for achieving a holistic view of American culture. As sociologist Robert Bellah observed regarding the study of culture, "Being concerned with the whole does not mean a mere adding together of facts from the various specialized disciplines. Such facts become relevant only when interpreted in terms of a frame of reference that can encompass them and give form and shape to a conception of the whole." However, the myth and symbol school of American Studies often viewed certain forms or symbols solely in American terms. This narrow emphasis reinforced ethnocentric American beliefs about its chosen character and its uniqueness in human history. Tate argued that myth and symbol studies should be flexible enough to accommodate the notion that certain forms may grow out of archetypes of humanity as well as out of unique cultural traditions. American culture is still part of a larger human experience.

Drawing heavily upon the work of Ernst Cassirer, Tate suggested that an American Studies methodology should examine three critical dimensions of symbolic forms. The first dimension involves analysis of form, the symbol's basic structure and the role of the individual creator, such as the arch form designed by architect Eero Saarinen for the Jefferson National Expansion Memorial. The second dimension involves analysis as process, the evolution of the form within its specific cultural milieu, such as the effects of rapid urbanization upon American attitudes toward nature. The third dimension involves analysis as achievement, the cultural meanings assigned to a given symbol like the Jefferson National Expansion Memorial. These meanings might include the predominant American belief in progress, the triumphal arches of classical antiquity, or the archetypal human desire to touch the sky.

Although architects Thomas Jefferson and Eero Saarinen both sought to give formal expression to the meaning of American experience, they also recognized and drew upon the vast reservoir of human experience in their search for ideal forms. As noted cultural geographer Yi-Fu Tuan observed, the Memorial is not just a triumphal arch; it is also the dome of heaven. It is appropriate to view a symbol of their lives and work in this larger, more complete perspective. Like the memorial to Washington, it, too, reaches upward -- a silver thread uniting earth to the blue of heaven above. Creating such a view of the phenomenon of place is the province of the humanities.

National Association for Humanities Education 1991 Biennial Conference

Call for Papers

April 18-20, 1991
Lafayette, Louisiana

Conference Theme:
The Global Humanities: Unity in Diversity

The National Association of Humanities Education invites submissions for papers, panel and discussion workshops for presentation at its biennial conference to be held April 18-20, 1991, in Lafayette, Louisiana. Sponsored by the University of Southwestern Louisiana, the conference will be held at the same time as Lafayette's *Festival International*, one of the top 100 music and arts festivals in the United States. In keeping with the opportunities provided by the festival performances, the theme of the conference will be "The Global Humanities: Unity in Diversity." Interdisciplinary papers and panels are especially solicited. Papers should be planned for twenty minute reading time; panels and workshops should be limited to an hour and a half. A one-page abstract for each presentation should be submitted by November 1, 1990. Proposals and inquiries should be addressed to Darrell Bourque and Vaughan Baker, Drawer 44691, University of Southwestern Louisiana, Lafayette, LA 70504-4691.

"ALL THINGS FALL AND ARE BUILT AGAIN": ENVIRONMENTAL EDUCATION IN A LITERARY CONTEXT

Usually when we claim that Environmental Education is interdisciplinary and includes language arts or poetry, we mean that we end a field trip experience with a group poem or cinquain. This paper's goal is to explain a more sophisticated way to meet Environmental Education through the interpretation of literature, in this case nineteenth and twentieth-century English poetry.

Environmental Education began as an examination of people's relationship with the natural world. However, it has become a study of our changing relationship with our total environment. Concurrent with this evolution of Environmental Education from a study of nature to an emphasis on conservation, to a concern with the total human environment (including socio-economic and human-made) has been a growing awareness that humans are a part of their environment, and that we define our relationship with it. Similarly, poets over the last couple of centuries have been grappling with the nature of that relationship. Literature, philosophy and environmental writings are replete with attempts to explain or rationalize our relationship with our environment. Alan Watts, in *Man and Nature,* offers a Taoist interpretation. The books and essays on Deep Ecology present a more recent description. Most Environmental Education programs promote a holistic as contrasted with human-centric environmental ethic, again interpreting people as a part of the natural processes. The poets and poems I will describe also address this human/environment relationship.

Like the early environmentalists whose interest in their world focused on their natural environment, nineteenth-century English Romantic poets were obsessed with Nature. These poets turned to Nature for spirituality because of their century's unprecedented scientific and technological changes. While these advances materially improved most English people's lives, they also robbed them of religion and shook the foundations of their ironclad social structures. These disruptions caused the Romantic poets to mourn the loss of spiritual transcendence and to long for permanence through an escape from the materialism and temporality of our mundane world. William Wordsworth's sonnet "The World Is

1371

Too Much With Us" voices the complaint of a whole generation:

The world is too much with us; late and soon,
Getting and spending, we lay waste our powers;
Little we see in Nature that is ours;
We have given our hearts away, a sordid boon!

The Sea that bares her bosom to the moon;
The winds that will be howling at all hours,
And are up-gathered now like sleeping flowers;
For this, for everything, we are out of tune;

It moves us not. --Great God! I'd rather be
A pagan suckled in a creed outworn;
So might I, standing on this pleasant lea,
Have glimpses that would make me less
forlorn;
Have sight of Proteus rising from the sea;
Or hear old Triton blow his wreathed horn.

(Wordsworth 289)

Wordsworth complains of the material world and the worries caused by preoccupations with this world and the frantic pace at which he and his contemporaries earned their livings. He complains of his loss of nature, but it is not just nature that he has lost. Nature is equated with emotions and the spirit: immaterial things which contrast with the worldly things which harass him and his contemporaries. It "moves us not" because Wordsworth and his contemporaries are spiritually and emotionally deprived—and fragmented. Like contemporary environmentalists, all the poets we will study believed that an appreciation of Nature could restore a lost wholeness.

Wordsworth longs to be reconnected with nature, but again, nature is more than lakes, rocks and trees. For what does a connection with nature finally allow? "Glimpses that would make [him] less forlorn; / . . . [the] sight of Proteus rising from the sea; / . . . [or] Triton blow[ing] his wreathed horn." The ability to appreciate nature restores the ancient gods: it gives him religion and something to believe in.

Wordsworth hoped to unite with nature and, thus, recover his soul and transcendence. Unable to turn outside themselves to religion or to science for this connection, the nineteenth-century poets exhorted their fellow humans to look within themselves to the visionary powers of the imagination, defined by Samuel Coleridge as "a magical power ... that blends and ... fuses [and] reveals itself in the balance or reconciliation of opposite and discordant qualities" (Coleridge 470).

In its ability to reconcile the warring contraries of our alienated lives, the Romantic imagination anticipated the goals of the environmentalists of the 1980s. The goals were transcendence and permanence; the means were the unifying and visionary powers of the imagination engaged with Nature. And the Romantic poets achieved their goals.

However, the century marched on and civilization brought with it more and more discontents so that twentieth-century poets no longer felt the Romantics' visionary power to unite with nature. The nineteenth-century John Keats was able (at least for a time) to join his "immortal" nightingale, whom he addressed as "Darkling" in his "Ode to a Nightingale"; the whole poem celebrates his vision. However, Thomas Hardy is unable to join with his decidedly mortal, "frail," "gaunt" "Darkling Thrush"—in a poem which deliberately alludes to Keats' victory in order to emphasize the alienation of the twentieth century:

I leant upon a coppice gate
When Frost was spectre-gray,
And Winter's dregs made desolate
The weakening eye of day.
The tangled bine-stems scored the sky.
Like strings of broken lyres,
And all mankind that haunted nigh
Had sought their household fires.

(Hardy 68)

The first stanza of Hardy's poem suggests modern people's limited imaginations through the speaker's lassitude, the bleak landscape which Hardy is unable to redeem, and the poem's comparison of tree-stems to the broken strings of a lyre, the traditional emblem of poetry.

In "Adonais," his elegy for Keats, the nineteenth-century Romantic poet Percy Shelley was able to console himself and his readers with the fact that Keats' spirit lives on in Nature:

He is made one with Nature; there is heard
His voice in all her music, from the moan
Of thunder, to the song of night's sweet bird;
He is a presence to be felt and known
In darkness and in light, from herb and stone.

(Shelley 1052)

However, the atrocities of modern warfare do not allow twentieth-century Wilfred Owen to claim such transcendence. The speaker in "A Terre" compares himself to a dug-out rat and mocks Shelley's elegy to Keats:

"I shall be one with nature, herb, and stone,"
Shelley would tell me. Shelley would be
stunned:
The dullest Tommy hugs that fancy now.
"Pushing up daisies" is their creed, you know.

(Owen 65)

This brings us to a low point in poets' relationship to nature. Humans have achieved the ultimate degradation: no spirit; no soul; they are pure matter, earth and worms.

T.S. Eliot's poems most vividly dramatize the poverty of the modern imagination and twentieth-century people's alienation from their environment. The opening of "The Love Song of J. Alfred Prufrock," for instance, contrasts markedly with Romantic poems which celebrated nature with gorgeous metaphors. Eliot's poem begins with an ugly, but indescribable horizon:

Let us go then, you and I,
When the evening is spread out against the sky
Like a patient etherized upon a table; . . .

(Eliot 3)

What kind of a landscape is this? Dismal, certainly; flat, maybe; but it is hard to say much more. This description tells us much more about the mind which creates it than the world that it describes. It tells us about a failed imagination; about a mind which is numb and unable to connect with the world around it. Eliot's poems (and our contemporary world) are full of paralyzed characters and desiccated landscapes, as the title of his masterpiece, *The Waste Land*, suggests.

The modernists of the twentieth-century do not blame nature for their failure, but themselves. Their alienation results from their state of mind which Eliot defines as a "dissociation of sensibility" ("Metaphysical Poets" 247). This is the opposite of the unifying imagination which Coleridge described. Central to this dissociation is a duality between reason and emotion. The opposite of this dissociation, according to Eliot, is a "mechanism of sensibility which could devour any kind of experience":

> When a poet's mind is perfectly equipped for its work, it is constantly amalgamating disparate experience; the ordinary man's experience is chaotic, irregular, fragmentary. The latter falls in love, or reads Spinoza, and these two experiences have nothing to do with each other, or with the noise of the typewriter or the smell of cooking; in the mind of the poet these experiences are always forming new wholes.

Eliot's criticism of fragmentation and his desire for wholes anticipate many of Environmental Education's goals. We, too, have a segmented world view. Many children think the origin of milk and eggs is the refrigerator or grocery store, and few adults know where their household wastes or the wastes from their workplace end up. We can support the end to deforestation of the South American rain forest ecosystem, but not comprehend the significance of a decision to fill a local wetland for expanding economic development in our own community. Hunters and fishermen, too, can advocate stocking streams and reintroducing game species, but fail to recognize the importance of habitat protection as the key to sustaining wildlife population.

All of the major modernist poets decry some sort of dissociation and desire to regain what W.B. Yeats called a "Unity of Being." Yeats' poem "Among School Children" ends with a paradigm of the modernists' ambition:

> O chestnut tree, great rooted blossomer,
> Are you the leaf, the blossom or the bole?
> O body swayed to music, O brightening glance,
> How can we know the dancer from the dance?
>
> (Yeats 214)

The chestnut tree is neither leaf, flower, or trunk, but all these things; it cannot be understood except as a whole. And we cannot know the dancer from the dance: the dancer's movements embody the dance's abstract patterns so that dance and dancer are one. Like environmentalists, Yeats insists that all things are interconnected and dependent upon each other.

Modern poetry at the beginning of the twentieth century was incredibly various, but its goals were not. Ezra Pound, Yeats, Eliot and many of their contemporaries sought to heal their divided souls through an *organic* poetry which mimicked the coherence of Yeats' chestnut tree and dancer. It is difficult to define what this poetry of "being" *is*, but it is easy to say what it is *not*. It is first of all not intellectual. The modernists blamed the duality between reason and emotion and between man and his environment upon elevation of the intellect: "I think, therefore, I am alienated," they might have said.

Because of their opposition to the intellect, the modernists attacked rhetoric and discursiveness and championed a poetry of *things* rather than *ideas*. This, in brief, was the Imagists' enterprise: to create a concrete poetry of "being." Pound's "In a Station of the Metro" is the quintessential Imagist poem:

The apparition of these faces in the crowd;
Petals on a wet, black bough.

(Pound 109)

The poem captures Pound's impressions of a series of beautiful faces which greeted him while he was walking out of a subway train on a wet, cold day. Pound described an "image" as "an intellectual and emotional complex in an instant in time" ("A Retrospect" 96). This poem tries to communicate the thoughts and emotions of the momentary revelation which occurred on that cold day. Through this quick, spare, concrete style, Pound would make his audience experience the same ecstatic shock of recognition that he felt. The word "apparition" helps him achieve his goal: one of its meanings--"an immaterial appearance which seems real, and is generally sudden or startling in its manifestation"--captures the full nature of Pound's experience; moreover, its supernatural connotations, as well as its elevated tone, lend distinction to the event. The comparison of the faces to petals contributes to the bittersweet impression of this exhilarating, but poignant moment. Pound was struck by the beauty, but also the fragility of these faces against the tawdry walls of the subway: these resemble petals which alight for a moment on a wet bough, but will soon fall to be crushed underfoot. In spite of their transience, Pound has managed to give the faces and their impression some permanence--to wrest some stability from the delirium of our busy lives amidst the frenzy and swelter of the city and the unrelenting progress of time. He does this in part through the lack of verbs. Verbs place us within time: by denying his poem verbs and using mostly nouns and adjectives--the parts of speech called substantives--he gives substance and permanence to the faces and also to his and our experience.

A poetry of "being" thus restores some of the stability and unity that the progress of civilization threatens. The modernists' desire for unity is also abetted by their poems' demands upon their audience. Pound's poem cannot succeed if it merely *tells* us about his vision; we must experience it ourselves. Similarly, education that only *tells* ultimately fails. Environmental Education today includes experiential learning.

My final poetic example, Yeats' "Lapis Lazuli," achieves just such reader involvement. Its political meditation upon World War I and the possibility of another war introduces a discussion of the unavoidable tragedy of our lives--all those things which have troubled the poets we have been studying. The poem then, rather unexpectedly, concludes with the speaker's reflections on a Chinese statue of lapis lazuli:

Two Chinamen, behind them a third,
Are carved in lapis lazuli,
Over them flies a long-legged bird,
A symbol of longevity;
The third, doubtless a serving-man,
Carries a musical instrument.

Every discoloration of the stone,
Every accidental crack or dent,
Seems a water-course or an avalanche,
Or lofty slope where it still snows

Though doubtless plum or cherry-branch
Sweetens the little half-way house
Those Chinamen climb towards, and I
Delight to imagine them seated there;
There, on the mountain and the sky,
On all the tragic scene they stare.
One asks for mournful melodies;
Accomplished fingers begin to play.
Their eyes mid many wrinkles, their eyes,
Their ancient, glittering eyes, are gay.

(Yeats 293)

A brief description of the actual details of the carving leads into an entire stanza of speculation. We do not know what the discolorations or the cracks represent, but they *seem* like a watercourse, an avalanche, or a lofty slope. The speaker talks of a plum *or* a cherry-branch which decorates the half-way house, but neither are actually in the carving. Nor are the Chinamen playing their songs. All these details rely upon the speaker's imagination; they do not actually exist. Of course, we, the readers, see these things as the speaker creates them. And that is precisely Yeats' point: the power of the imagination to engage with its environment and, thus, to create and to envision.[1]

Our entire environment is central to the modernists' victory over the tragedies of our lives. The modern imagination needs to be--as Yeats described it--"rooted in the earth." His sense of the "earth," however, is metaphorical. What is important is not that it's natural, but that it is *concrete*--for several reasons. The materiality of worldly objects gives their visions substance and permanence. This materiality also resists the intellect or reason, which (as I said) modernists blame for our alienation and division. Only things can rescue us from dissipation into abstractions and ideas. Things of the external world also draw poets outside themselves; they require an unselfish attention to something beyond one's ego. By reaching out to the world, we reach out to others and can even reach out and connect with parts of ourselves that we have lost. But as with environmentalists, the modernists' sense of their environment has extended beyond the natural world of the Romantics to include man-made environments, such as a subway or a Chinese sculpture.

Creativity is not limited to the speaker; through the concrete details of what are, or what might be, the poem draws its readers into its scene and they create as they climb the hill with the Chinamen—as they interact with their environment.[2] Just as the details of the sculpture cannot contain the sculpture's possibilities, the details of a poem cannot contain its entire meaning. No matter how much I try to explicate Pound's or Yeats' poems for you, I will fail.[3] This is because a poetry of "being" extends beyond definable--and, therefore, limited--ideas. The truths of our existence are beyond any attempt to reduce them to definable or quantifiable essences. It is this potential that non-paraphrasable modern poems of "being" celebrate. Yeats summed it up in a letter just before he died: "Man can embody truth but he cannot know it" (1955). The Chinamen's song may be as close as we can get.

For, in spite of the insistent tragedies of history and of our individual lives, the Chinamen refuse to play mournful melodies: "their ancient, glittering eyes, are gay" because they realize the truth of two lines earlier in the poem, "All things fall and are built again/And those that build them again are gay." We are caught in a transient, material world, but we are blessed with the ability to participate in and engage with this world--whose very materiality permits spirituality. Their songs, like the lapis lazuli sculpture and the scenes we envision, affirm the power all of us have to counter this tragedy with our own creations out of the "rag and bone shop" of this everyday world (Yeats 335)--and our ability to join in this "building" through poetry, education, or environmentalism.

NOTES

[1] John Unterecker also stresses the "imaginative nature of [Yeats'] scene" in *A Reader's Guide to W. B. Yeats* (London: Thames and Hudson, 1975) 260. He remarks: "each accident of the stone 'seems' to have meaning, but that meaning—Yeats insists—is in the observer."

[2] See Unterecker 260: "The 'meaning' of the work exists not in the observer alone but, as well in the interpreter."

[3] W. H. Auden is explicit about this experiential dimension of poetry (310):

> Reading is valuable, just because books are like people, and make the same demands on us to understand and like them . . . . Just as a boxer exercises for a real fight with a punchball or with a sparring partner, so you can train yourself for relations with real people. . . . Reading is valuable when it improves our technique of living, helps us to live fuller and more satisfying lives.

NATURE IN AMERICAN LITERATURE: A COURSE IN LANDSCAPE, ENVIRONMENT, AND LEARNING IN THE HUMANITIES

Among the favorite objects of attack in popular journalism today--and on many campuses--are the curricula changes which swept higher education in the late 1960s and early 1970s. The student protests of those years are blamed for causing the abandonment of long-standing requirements, resulting in low scores on basic skills tests, cultural illiteracy, and a host of other woes which confront faculties across the nation. Indeed, the introduction of General Education programs at many institutions is seen as proof that the demands of twenty years ago were ill-founded and the resulting changes were a failure. Yet we too often forget that many of the changes were positive--and that education today has benefited because of them. The interest in multiculturalism and the environment, sensitivity to gender and ethnicity, new historical and political perspectives, even new diseases, have irreversibly changed what we teach and how we view our students. Also, many of the courses which were introduced to replace traditional offerings were not faddish or superficial, but fresh and intriguing. They showed that standard material could be organized and discussed in a new way which greatly enhanced the learning environment. Of the courses which we have tried at my college, one of the most successful has been a sophomore literature offering entitled Nature in American Literature.

The thought that nature might serve as an organizing device for a survey of our country's literature is not a far-fetched idea, for many scholars have felt that the physical environment has always been a dominant feature in the American experience. Elaine and William Hedges state in *Land and Imagination*:

> Americans have always had strong feelings about the land they left the old world for. They have marveled at the soil's fertility and the landscape's beauty...the rugged vastness of the continent in time became an irresistible promise, and strong feelings gave rise to extravagant aspirations, dreams, and visions...[especially] the glorification of American rural life and the cultivation of the belief that men and women living in intimacy with the land can dwell in harmony with one another.

On the other hand, Leo Marx in *The Machine and the Garden* feels that Americans have had an ambiguous attitude toward their surroundingssometimes idealizing wild nature, sometimes glorifying the industrial cityscape--and that they frequently tried to resolve those ambiguities through the artificial realm of the pastoral. As I began to examine some of these views with the goal of developing a new course, I discovered that the subject was even more complex and that a number of different attitudes towards nature were reflected in literary works, varying from romantic to deterministic and including many types of landscape and cityscapes, both internal and external.

In planning any new course, one has to consider what selections to include and how to arrange them. A one-semester survey is a particular problem because of the difficulty of trying to cover a number of authors without completely overwhelming the students. I was lucky to find a text entitled *The American Landscape* by John Conron, which dealt specifically with the subject. In his introduction, the author says, "Landscape is an old and still necessary way of arranging and expressing what we see and imagine about our earth-space" (xviii). But, he adds, "In no culture has this been more evident than in America, and in no culture has the spatial construct of landscape been more indispensable, for we seem to see ourselves as a people living in space more than time, in an environment more than in a history" (xviii). Conron organizes a wide variety of authors of poetry, short fiction, essays, and travelogues into chapters with the following titles:

Deformations: Twentieth Century Landscape of Ruin
The Early Explorers
The Cultivation of the Promised Land
Eighteenth-Century Perspectives: Natural History and the Sublime
The Poetry of Scene: An American Grand Tour
Landscape in the Great Theater of Human Events
Landscape as Idea: The Transcendentalists
Landscape as Idea: Romantic Prose and Poetry
The Way West: Explorers, Travelers, and Emigrants
Landscape as Antagonist: The Literary Naturalists
Landscape into Myth and Ritual
Affirming the Ancient Connections: Twentieth-Century Symbolic Landscapes

I rearranged his materials, to some extent, so that I could trace the theme chronologically. After an introductory lecture in which I showed the class that the roots of the environmental movement reached back to ancient Greece and the Orient and are reflected in many Renaissance works including Shakespeare's *The Tempest*, I asked the students to begin with Conron's second chapter, "The Early Explorers." Adam of Bremen, Columbus, Verrazano, Barlowe and others saw the continent as a paradise, a new Golden Age peopled with noble savages; they filled their accounts with praise for the "extremely fertile," "marvelous," and "incredibly fine" world. After these accounts, we studied the Puritans, who, arriving in the next century, saw things differently, feeling they had come to a hostile wilderness filled with savages--a "howling desert." With time, the arrival of new immigrants, and the emergence of the pre-romantic movement, writers and thinkers no longer perceived nature as frightening, but as exciting and stimulating. For the first time, a number of people actually began to look at their surroundings closely and to extol what they observed. All over Europe and America, writers, artists, and tourists began to climb mountains, look at the sky and vast landscapes, and praise the "sublime" qualities. Jefferson says in his *Notes on Virginia* that the Natural Bridge is a scene "worth a voyage across the Atlantic." Like Irving and Cooper later, these writers described what they saw in terms of painting, consciously sketching settings for their travelogues and stories. The sublime and romantic movements are so important in this anthology that the author devotes four chapters to them.

This worship of nature was taken to its logical extreme with the transcendentalists. Although students had difficulty reading Emerson's "Nature," they delighted in Thoreau whose observations on Cape Cod and in Maine seemed very modern. In addition to the more familiar authors and works which illustrated these ideas, including Hawthorne, Poe, Douglas, Bryant, Dickinson, and Whitman, I also included some lesser known selections which added an additional perspective and surprised the students by their novelty. They had thought Poe was only interested in philosophy and the occult and not in landscape gardening ("The Domain of Arnheim"); that communes were invented by the rebels of the 1960s and were not a part of Hawthorne's experience (*The Blithedale Romance*); and that, of all people, Louisa May Alcott did not have a sense of humor ("Transcendental Wild Oats").

One of the most significant and in many ways unique aspects of American history was the westward movement. Selections from the early journals of Lewis and Clark to the later local color stories of Twain and Harte detailed images of landscapes which were awe-inspiring and fearful, but also were realistic in their recreation of actual speech and regional differences. Early writers described the vast prairies, rivers, mountains, and natural wonders. Later, the mining towns and experiences of the settlers were popular reading for Eastern audiences.

Nature in nineteenth-century American literature was not confined to ideas about the wilderness. In short fiction such as "Bartleby the Scrivener" and "The Tartarus of Maids," Melville depicted the physical and psychological damage which could result from the rapid growth of the city and industrialization. He had the foresight to recognize the inherent dangers and to symbolize them with his lonely, spectral law clerk and his sickly factory workers. He had laid the groundwork for this view in *Typee*, where he showed that the idyllic life of south-sea islanders contrasted starkly with the experiences of his civilized countrymen (since Conron does not include Melville, these three selections were supplemental readings). Melville was concerned because a particularly ironic outgrowth of the sublime movement was its application to industrialization. Paintings of beautiful pastoral landscapes included factories and trains in the background, idealized so they were not a discordant element. The

1381

vast majority of Americans, and many writers, felt that these symbols of progress and the new cities were stimulating. Whitman in "Crossing Brooklyn Ferry" says that he "loved well those cities" where he saw "On the neighboring shore the fires from the foundry chimneys burning high and / glaringly into the night/ Casting their flicker of black contrasted with wild red and yellow light over the tops of houses." Melville's works were early harbingers of the deterministic visions of Crane at the turn of the century. This young author saw nature, whether manifested in the city (*Maggie: A Girl of the Streets*), the Western plains ("The Blue Hotel"), or the ocean ("The Open Boat"), as a cold, antagonistic enemy.

In the early twentieth century, authors such as Cather and Hemingway continued to recognize the destructive force of industrialization and war, but they provided a solution. In "Neighbor Rossiky" and *My Antonia*, a return to the land, especially the farms cut out of the Western plains, helps the protagonists experience a sense of renewal and wholeness. Hemingway's war-torn heroes also undergo psychological healing when they get away from civilization on fishing and hunting trips.

This tension between the city and the country remained a dominant motif in the twentieth century, as authors showed the ravages of over-development and the loneliness of city life. Robert Frost is best known for his poems about rural New England, but he also wrote "A Brook in the City" and "I am One Acquainted with the Night." Robert Lowell in "The Mouth of the Hudson" says the "Chemical air/sweeps in from New Jersey" and he bemoans the "sulfur-yellow sun of the unforgivable landscape." One of the most memorable passages in Fitzgerald's *The Great Gatsby* describes the ash heaps of Queens; and in the 1960s, Brautigan's *Trout Fishing in America* laments the disintegration of pastoral values.

One of Conron's most laudable decisions is to include native American and minority voices in his collection. "Landscape into Myth and Ritual" shows the impact of Zuni and Navajo myths and poetry on the contemporary experience. Also, in his final chapter, "Affirming the Ancient Connections," there are excerpts from other minority authors as well as mainstream writers such as Kerouac, Teale, Stevens, and Jeffers who express a new attitude of coexistence with nature. One of the most interesting of the modern authors is Annie Dillard whose prize-winning *Pilgrim at Tinker Creek*, an extended autobiographical essay, describes her close observations of the land and varieties of life in southwestern Virginia. A student of oriental philosophy, she spent hours observing minute sections of her environment which helped her to achieve a mystical sense of her self as a part of the universe. Psychology is also an important influence on twentieth-century American literature. Some modern authors feel nature is a projection of the subconscious. In "The Magic Poker," Coover's landscapes mirror the characters' psyches.

Wishing to go further than Conron to a genre which has always been in the forefront in dealing with the problem of environmental destruction, I ended the course with a consideration of science fiction. Many authors who set their action at a future time or on other planets are actually taking contemporary problems to their logical extension so that we can see the end results of overpopulation, the poisoning of the atmosphere, and the destruction of the food source. I chose to use a novella by Ursula LeGuin, *The Word for World is Forest*, which takes the reader to a planet whose inhabitants live in almost perfect harmony with their surroundings. Their world is disrupted and they are enslaved and exploited when humans come to harvest the lumber because earth has been completely deforested. The novel summed up most of the ideas about nature which I had previously covered, and the author seems to be arguing that Americans must sort out these ideas and develop a consistent position if they are to survive in an increasingly complex world.

In presenting this course material, I tried to keep my lectures brief, with a minimum of background material, since Conron has excellent introductions to each chapter. I also had students review key ideas in groups before a general class discussion. I have found this workshop format to have many advantages. It is an effective and non-intimidating method of ensuring that students prepare for class; it lets them test their opinions in an informal setting before sharing them with a larger audience; and it helps shy class members gain the courage to speak freely. Finally, the constant monitoring that this tactic allows gave me good feedback on individual understanding of the material. For longer or more difficult selections, I often gave out questions several classes in advance and asked that the answers be written and handed in prior to their presentation to the group. In addition to daily assignments, there were two take-home examinations. For the mid-term, students had to decide what views of nature appeared in a short story or poem which had not been assigned for class previously. For the final examination, I asked them to find as many attitudes toward nature as they could in the last novel, *The Word for World is Forest*, which had also not been discussed in class. Both examinations required that students apply what they had learned to a new situation.

Nature in American Literature has been taught at Ramapo College since 1983. It has been approved by the All-College Curriculum Committee as a component of the literature major in the School of American International Studies (Ramapo has an interdisciplinary structure), as a 200-level General Education offering, and as a recommended elective in the School of Theoretical and Applied Science.

Professors teaching freshman and sophomore courses often find themselves with hostile captive audiences, but the students who chose this class seemed intrigued with the theme, were willing to keep up with the reading, and performed better than their classmates in more traditional sections. I am convinced that a thematic arrangement helps them to remember material--and it increases interest. I have since tried the same technique with Introduction to Literature and freshman composition, with similar good results. Arranging material in a new way can invigorate a course for the student and the professor alike.

THE CITY AS THEME IN THE HUMANITIES CLASSROOM—AND AS UNPOPULAR THEME IN FINE ARTS

Among the various topics that are especially appropriate for integrating the concepts and materials of different disciplines into a coherent humanities course, *The City* is one of the most stimulating and popular. Cities are *concrete* from subway to penthouse and so the teacher does not have to present a theme such as *justice* or *love* that may seem elusively abstract to the student. The City is really there, and every American has had some personal experience with cities, directly or vicariously through the media.

Another advantageous quality of The City as a theme is that its *complexity* is readily apparent. The teacher does not have to do very much to persuade a student that a city is more than the dot on a map. Ordinarily one cannot comprehend the unity of a city from within it at street level, while an aerial view from an airplane, skyscraper or hill discloses the economic complexities of industrial, commercial, residential and recreational districts as well as the transportation networks. Furthermore, it takes little effort for a student to see within the inanimate physical city the *human* city, the dynamic social community. Not so readily perceived are the *historical* city and the *natural* setting, but once again, these can be discerned directly in physical realities. Thus, The City is one of the most accessible integrating themes we could hope to find, and it is filled with vital humanistic, social, political, economic and personal issues that make it a genuine topic for study and not a mere academic exercise. The accessibility of the topic has been borne out for me by the excellent City "units" I have observed in elementary grades, in secondary schools, in colleges and in post graduate and adult education.

In addition to the advantages of being a theme that possesses physical concreteness and multidisciplinary complexity, The City is (or can be) a topic that is particularly mature, sophisticated and elusive. When we enquire into such subtleties as the *image* of The City, or of the *atmosphere*, the *personality*, the *essence*, the *experience* and the *expression* of a city, the certain concreteness of cities disappears and we are obliged to wrestle with profound humanistic problems of dialectical change, evolution, cause-effect relationships, subject-object, figure-ground, organism-system, symbols and semantics--in short, all the exasperating abstractions of perception, definition and interpretation that show no sign of ending while human beings continue to puzzle out what they are, what they have wrought and what they might become.

My experience from having prepared and taught some four or five courses on cities (and towns) has been that the last-mentioned aspects of cities (and towns), that is, the *perception, definition* and *interpretation* of cities, of The City and of the "urban experience" require a quantum leap on the part of the student. Speaking quite honestly, I have not at all been satisfied with the effectiveness of my attempts to assist students in making that leap beyond very simple, almost instinctive responses. (Four simple responses include: 1. The ego-centric "this is what I think about my city"; 2. The cartographic "here is a map of this city"; 3. The journalistic "these are the issues facing the city today"; 4. The anachronistic "Rome was destroyed in 476 A.D. and Williamsburg is what towns once were like"). The simple responses are not invalid (there is no reason for a teacher to ridicule or deny them) but they represent what I call "cultural provincialism," the naive beliefs that Today is a unique creation, bearing no reference to past or future, and that What I See is all that matters. To express this as a cliché, cultural provincialism is an incapacity to perceive the Big Picture.

THE CITY: AN UNPOPULAR THEME IN FINE ARTS

The foregoing is the context for my primary topic. I make a practice of using the visual arts in all of my humanities courses, and in my courses on cities and towns, I rather blithely set out to find pictures that would exemplify the image of the city in the fine arts. My preliminary approach is to riffle through my memory bank for examples of paintings that either made the city a primary subject, or showed people in unmistakable urban settings. (I should mention that one of my courses was about rural and small-town lifestyles, and so I concurrently looked for these). Much to my surprise, the preliminary memory-search revealed a paucity of such pictures. Here is what I came up with on cities:

El Greco's views of Toledo
Many views of Venice by Canaletto
  and Guardi
Hogarth's views of London street life
Many Daumiers
Most Impressionists at some time:
  Monet, Degas, Pissaro, Renoir, etc.
The Ashcan School and The Eight:
  Sloan, Prendergast, Glackens, etc.
Twentieth-century photographers:
  Stieglitz, Shahn, Evans, Weegee, etc.
Various cubists: Feininger, Stella,
  Sheeler, etc.
The Thirties: Marsh, Burchfield, etc.

For small towns and villages:

Breughel
Dutch little masters: De Hooch,
  Ruisdael, Ostade
Some eighteenth-century French and
  English--(but I couldn't think of any)
Many nineteenth-century genre
  painters and academics
Barbizon School, now and then
The Thirties: Evans, Wood, Curry,
  Benton, Hopper

I then went to my memory bank for *popular* arts, and found a similar slenderness in the catalog:

- Hogarth, Rowlandson and Bewick
- Currier and Ives
- Dore's views of London
- Birds-eye view maps
- Many, many photographs and postcards
- Norman Rockwell
- *New Yorker* covers

A greater surprise has been that in looking more carefully, my original lists hardly changed. In short, what I learned is that cities *per se* have been very rare subjects for the visual arts, and that urban life styles (with the city as an unmistakable backdrop) are uncommon topics except for a few brief periods in art history, and these, in most cases, relate to an individual artist or nation. Smaller towns as subjects are rarer still, although rural agricultural activities and village life were tremendously important in the nineteenth century. There is a catch to this last observation, however: the "fine arts" of the nineteenth century have been overwhelmingly suppressed and are only recently emerging from museum basements. There are other exceptions, notably that the Italian Renaissance discloses a significant number of urban and town views as *secondary* subjects.

Of course we shouldn't be too surprised to find that the city has not been a primary subject for fine arts until the twentieth century. Christian subjects, mythology, history and genre, portrait, nude, still-life and landscape represent the mass of "approved" fine arts subject matter until this century when abstraction can be added (allowing for the fact that the subject abstracted may be a portrait, nude, still-life or landscape!).

The research method that I used to check my preliminary memory-search entailed paging through twenty-two art books and examining about 3000 pictures. Twenty-one of the books are in the *Great Museums of the World* series published originally by Mondadori of Milan and distributed in America by Newsweek Books. There are several reasons that these provide an excellent survey and several reasons that they distort it. Let me start with the distortions. Five of the books are about archaeological art museums (Athens, Cairo, Museums of Egypt, Pompeii and Mexico City) while one is oriental (Tokyo). I examined them anyway. Athens, Cairo, Museums of Egypt and Mexico City yielded no urban views, while Tokyo showed 3 urban and 4 village views and Pompeii had 14 urban and 5 suburban views. My interest, however, was in European painting from the early Renaissance to the twentieth century (prior to that I presumed the theme to be negligible and after that to be common) and thus the archaeological and oriental museums are worthy primarily for cross-cultural comparisons. Two other volumes are also peripheral (The Vatican and the British Museum) because of strong emphasis on antiquities and manuscripts. Therefore, although the sample could be reduced to 13 museums and about 1600 pictures, (there are around 125 plates in each volume), I included all but Athens, Cairo, Museums of Egypt, and Mexico City in my counting.

Another distortion is in the twenty-second volume, which is not in the

1387

museum series at all. It is the one apple among the oranges. I include it, however, because of the inherent critical distortion of the Great Museums series. This is somewhat ambivalent, because one strength of these volumes is the same as the weakness, namely, the selection of masterpieces for each volume was in the hands of the museums' directors or curators, with the assistance of established scholars. Therefore each volume represents the best of each museum--according to current perceptions. There are some very clear prejudgments in these. For example, despite the fact that many of these museums have substantial Impressionist, Post-Impressionist and contemporary art holdings, these do not account for very many of the plates. In addition, the American collections are given very small representation in the National Gallery of Washington and the Metropolitan, both of which are major repositories of American fine arts. There is nothing "wrong" with this; these museums have superb European painting collections and I am happy to see them. But it is true that my sample is neither random or representative. Without access to the stored collections of these and other museums, no one could come close to comprehensiveness.

To return to the twenty-second volume. This is *Art and Artists of All Nations*, published in 1894 with over 400 black and white photographic reproductions of academic art of Europe and the United States, much of which was selected for exhibit in the Fine Arts Building at the World's Columbian Exposition in Chicago. This I chose to sample because the realistic academic art of the nineteenth century is not represented in the Great Museums series, even though I know for certain that it abounds in London's National Gallery and the Louvre, and I strongly suspect that the Hermitage, the Metropolitan, the Boston Museum and the National Gallery of Washington have large holdings. As art fans know, all of this is being reassessed and the Impressionist strangle-hold on the latter nineteenth century is relaxing.

To summarize my method, I examined about 3000 pictures, mostly paintings, none of which were pre-categorized by subject or theme, representing (more or less) the whole spread of fine arts (including Egypt, Subsaharan Africa, pre-Columbian Americas, China, Japan, India). In twenty-one volumes, the art works were included because of quality and significance as perceived by the authoritative arts establishment c. 1968-1981 (the years of publication); in one volume, the art works were selected as *contemporaneous* masterworks c. 1870-1894.

The criteria and categories that I noted were as follows:

City or urban space as primary subject
The city as background
Urban activities--interaction of people and urban environment
Village or rural locations and activities.

(Some ambiguities forced most choices: for example, I didn't count a castle in the background as a village, hunting scenes were not counted as "rural" activities, some early Renaissance scenes have architectural perspectives that are technical rather than being descriptive of cities or urban spaces, and many genre interiors and patios of manor houses, churches, taverns and inns are impossible to identify as urban or rural). In the Great Museums series I discerned *urban* themes in:

93 paintings 1500-1900
1 painting post - 1900 (Feininger)
3 medieval (one Islamic)
13 Roman (Pompeii-frescos and mosaics)
4 Japanese

114 Subtotal

However, of these, only 36 have the city as the *primary* subject, and Venice is the subject of 16 of these! (Canaletto 6, Guardi 6, Bellini, Carpaccio, Turner and Monet 1 each). The other identifiable cities are Amsterdam 2, Dresden 2, Toledo 2, Haarlem 2, Vienna 1, Delft 1, Padua 1, Kyoto 1). When we note that the paintings of Dresden and Vienna are by Bellotto, a Venetian of the school of Canaletto and Guardi, we can discern that the city is indeed a subject of narrow artistic interest and limited popularity. As *primary* subject in European and American works from Pompeii to the present the city scores 2%.

The proportion doesn't change greatly in the academic art of *Art and Artists of All Nations*. *Urban* themes:

37 paintings c. 1870-1890
3 primary subjects (Venice, Benares, Christiania)

which is under 1% with cities as a primary subject.

The approximate percentages given the *general* urban thematic categories are 5% for Great Museums and 9% for Art and Artists.

Possibly it is more significant that the rural-village themes are represented in 49 pictures in Great Museums and 88 pictures in Art and Artists, or 2 1/2% in Great Museums and 22% in Art and Artists.

Here is a chart breakdown of findings:

	City Primary	**City Background**	**Urban Activities**	**Rural**
Great Museums (2.5%) (N=2000)	36 (1.8%)	40 (2%)	36 (1.8%)	49
Art + Artists(22%) (N=400)	3 (0.75%)	5 (1.25%)	29 (7.25%)	88

I will now hazard some conclusions and interpretations.

1. Among the major themes of fine arts, the city is of negligible importance. Indeed, given the styles of El Greco, Canaletto, Bellotto, Guardi, Monet and Ruisdael the city is best regarded as a subset of landscape, which, like nude and still-life, is often an exploration of color, light, mass and texture rather than an investigation into meaning or a rendition of data.

2. In spite of the presumed distortions of selection by the arts establishment, it is unlikely that any sort of more comprehensive study or more scrupulous sampling would greatly alter the proportions, except for America's New Deal art.

3. The overwhelming popularity of Venice as a subject is an indication that cities have not been regarded as objects of beauty, appropriate to landscape arts. Venice has been and remains singularly picturesque, with continuous balance between natural (sky and water) and constructed environments. It was the one stop on the Grand Tour where the city itself was the object of tourism.

4. During the early Renaissance cities and towns seem to have been objects of considerable interest to painters, but due to the patronage of churches and nobility, these interests were relegated to backgrounds and did not evolve into primacy as did still life, the nude and the rural landscape.

5. Following the early Renaissance, the Dutch painters dominate in paintings with urban and village settings. There is a wealth of significance in this. We are dealing with middle-class patronage in which popular tastes for the familiar, plain and simple were replacing the remoter sophisticated conventions of Christian and classical symbolism. Furthermore, they were laying the groundwork for the genre subjects that would satisfy middle-class desires for understandable fine arts in the nineteenth century.

6. Although the nineteenth century saw the rise of the modern city as a dominant economic and social force in world cultures, there was if anything a reduction of interest in the city as a subject for fine arts. However, the tremendous increase in genre painting, which requires a realistic setting for the primary subjects of human social activities, increases the number of urban settings. Yet this is nothing when compared with increase in rural subjects which are clearly an antiurban reaction. The paintings, when landscape, are *pastoral* (whether Hudson River, Barbizon, Impressionistic or Academic) or, when genre, are *nostalgic* (of Volkeskunde, Cavalleria Rusticana, or Good Old Days styles).

7. The twentieth century will probably prove to be an exception to the rule that urban themes are unpopular in the fine arts, although the dominance of abstraction and expressionism from 1910 through 1970 makes it sometimes difficult to remark on external subject matter.

8. The observations of visual fine arts appear to be parallel to the other fine arts--literature, drama, music and dance.

9. The popular arts are essential to any academic study on the theme of the city. The lack of interest by fine artists makes it necessary for us to turn to broadsides, engravings, illustrations, maps, newspapers, photographs, adventure fiction, and popular entertainments to get inside of cities.

10. Related to popular arts are local fine arts. Art museums, historical museums and public libraries are often repositories of cityscape paintings that are presumed to be of only local interest, although many of these are of astonishing beauty and vitality. Various articles in *American Heritage* magazine over the past two or three decades have printed reproductions of local urban art.

The last of the conclusions may point to some ways of constructing a Cities humanities course. It seems to me that regardless of how historical and exotic the primary content of the course may be, one purpose should be to place your own town into a Big Picture. Familiarity blinds our perceptions of locale, and even austere Ralph Waldo Emerson bent over to view Concord freshly, upside down between his legs! Pictures can also help us to objectify our homegrounds. Check with your county historical society and public library for resources--photographs, panoramas, birds-eye views. Have students revisit such sites, take Polaroid shots, compare and discuss. Or, after studying functional places in a Great City (such as government center, gateway, plaza, ceremonial center, ghetto, etc.), find a cognate place in your city, explore its evolution and discuss.

But even with the great cities of history, pictures are necessary to humanize the remote places and times. In one course I developed a few years ago, we focussed on a significant decade for the cities of Florence, London and Chicago, read one major work (Vasari's *Lives of the Painters,* Defoe's *Moll Flanders,* Sinclair's *The Jungle*), and had each student assume the persona of a historical man or woman of the city. One task for each character was to give the class a guided walking tour of their city. The results were uneven, but it is not an easy task to project yourself imaginatively into an eye-level saunter, looking up at Ghiberti's Baptistry doors or seeing the White City of the World's Columbian Exposition for the first time. It is more than a matter of adding a third dimension to a street map; it is an adventurous exploration of human surroundings. Moreover, it is truly interdisciplinary, partly because it is multisensory (the urban experience is one of sounds, smells, tastes, bumps, breezes and jostlings as well as shapes, colors, light and shadow); but also because it needs the social, temporal and emotional insights into human behavior that can only come from historical evidence and literature and arts--the humanities.

RESOURCES ON THE INTERPRETATION OF CITYSCAPES

Finding reproductions of works of art depicting cities and towns is mainly a matter of paging through picture books (a pleasurable task that any humanities teacher should do as quiet recreation) or being alert to the theme during museum visits. To understand the visual messages of cities throughout history, I think there is nothing better than Edmund Bacon's *Design of Cities,* now available in a Penguin paperback (1976). Some of the best ideas for student activities are in Grady Clay's brief but illuminating *Close-Up: How to Read the American City* (University of Chicago 1980). For small town reading, I recommend my "Types of American Small Towns and How to Read Them" (*Southern Quarterly*

XIX:1, pp. 104-135). Thomas Schlereth's *Artifacts and the American Past* (American Association for State and Local History 1980) has many methodological ideas, for example a chapter on map-reading, one on museum villages as "learning laboratories," another on reading vegetation as historical data, and a long chapter on Chicago. These last three works all evolved from teaching college classes, while Donald J. Olsen's handsome *The City as a Work of Art: London-Paris-Vienna* (Yale University Press 1986) was "tried out" with his college students. A brief article which I published in *Humanities Education* rather neatly codifies "Ten Humanities Views of City" (IV:2, Spring 1987). Finally, for a delightful approach to making historic cityscapes come alive, Jack Finney's science-history-fiction-fantasy *Time and Again* (Simon & Schuster 1970) is invaluable.

EMERSON'S VIEW OF THE CITY

It is ironic that so much of the American myth of the pastoral and of the agrarian idyll depends upon a view of Ralph Waldo Emerson as anti-urban, when, in fact, Emerson not only valued the city but also offers in his essays some of the most valuable distinctions between life in the city and life in the country that have ever been made. Unfortunately, writers like Emerson and Thoreau are generally envisioned walking in the country and are usually thought of as lovers of nature and despisers of cities. In fact, Morton and Lucia White, in *The Intellectual Versus the City*, suggest that "in Emerson we find the beginnings of a more elaborate anti-urban ideology than we find in Jefferson, one that influences much of our literature to the present day." Even Michael H. Cowan, in his excellent study *City of the West: Emerson, America, and Urban Metaphor*, agrees with Leo Marx that cities were most important to Emerson for allusions or metaphors; they were less important to him in and of themselves.

The view that Emerson was essentially anti-urban or that he did not value the city strikes me as puzzling, given Emerson's own life. We know that he was formed as a youth and young man by an urban world and spent most of his adult life either in the city or in making regular visits to the city. In addition, in his letters and *Journal*, Emerson explicitly defines a need for both the country and the city in his own life, and he even calls himself a "city-bred farmer." This phrase clearly suggests that the foundation of his life was urban, with rural attributes being later, valued acquisitions.

I believe, then, that an accurate view of Emerson requires that we re-examine our reading of Emerson, that we step back and place his individual, metaphoric statements about the country and the city in a different perspective. It seems to me quite clear that Emerson--as we know him through his works--believes the city to be an important and even a *necessary* part of human experience. In developing this thesis, I shall argue that Emerson is neither anti-urban or pro-urban, anti-country or pro-country. Rather, he identifies many advantages of city life in his works, just as he identifies many advantages of country life. And although he also identifies many dangers of the city, he identifies equally many dangers of the country. In other words, Emerson's works suggest that individuals who wish to realize their full potential, that is, their godlike nature, probably *need* both the city and the country, but *especially* the city.

Emerson's organic view of the universe necessitates his acceptance of the city. He believes in a unifying spiritual force, sometimes called the "Over-Soul," which takes form in the diverse material phenomena of life; that is, he conceives of a dualistic universe (a world of matter and spirit) in which each material form is inherently a divine microcosm of the divine macrocosm.

In his essay "The Over-Soul," Emerson writes that "We live in succession, in division, in parts, in particles"; "we see the world piece by piece . . . but the whole, of which these are the shining parts, is the soul." In "The American Scholar," he argues that there is only "One Man" and that "you must take the whole society to find the whole man." This whole man, he explains, includes the farmer, professor, engineer, priest, scholar, statesman, producer, and soldier: "he is all." Each is all (a microcosm of the macrocosm) and therefore divine in its essence. In "The Poet," Emerson explicitly states that even the "factory-village, and the railway . . . fall within the great Order not less than the bee-hive, or the spider's geometrical web. Nature adopts them very fast into her vital circles, and the gliding train of cars she loves like her own." Thus, even the country boy coming to the city, Emerson says, is not filled with wonder at the city because he sees in it simply a "new fact," another "great and constant fact of Life," that is, a material form of the Spiritual Whole. In the same essay he points out that all of "America is a poem in our eyes": "our logrolling, our stumps and their politics, our fisheries, our Negroes, and Indians, our boasts, and our repudiations, the wrath of rogues, and the pusillanimity of honest men, the northern trade, the southern planting, the western clearing." Thus, the pulse of life beats in all forms that the life force, the Over-Soul, takes—whether these forms be rural or urban. All are, in essence, divine.

The quality of an individual's life in Emerson depends upon the level of consciousness which the person can develop and maintain, the degree to which the person can recognize and realize (and feel) Oneness with the Over-Soul. In *Nature*, at first Emerson appears to argue that the country or farming life may offer more possibilities for such consciousness. He explains "that every natural process is a version of a moral sentence . . . . All things with which we deal, preach to us"; that is, each material phenomenon can reveal to us truths about the world and knowledge of the essential divinity of the universe. The example that he uses is the farm. He asks, "What is a farm but a mute gospel? The chaff and the wheat, weeds and plants, blight, rain, insects, sun,--it [the farm] is a sacred emblem from the first furrow of spring to the last stack which the snow of winter overtakes in the fields." Farmers learn from the natural facts and processes around them; each of these can illustrate truths to them.

But Emerson quickly adds that such is true also for "the sailor, the shepherd, the miner, the merchant." Each of them has "experience precisely parallel, and leading to the same conclusion: because all organizations are radically alike." In other words, "a rule of one art, or a law of one organization, holds true throughout nature. So intimate is this Unity, that, it is easily seen, it lies under the undermost garment of nature, and betrays its source in Universal Spirit." Again, Emerson's point is the organicism of the world—"the unity of

Nature,--the unity in variety," a unity which encompasses both rural and urban forms. He cites Xenophanes' complaint in old age that "look where he would, all things hastened back to Unity. He was weary of seeing the same entity in the tedious variety of forms . . . Each particle is a microcosm, and faithfully renders the likeness of the world."

Despite the fact that Emerson's theory of organicism not simply accepts but embraces both the natural world and the artificial (because created by people) world of the city, those critics who argue his anti-urbanism point to specific passages in which Emerson clearly appears to value the country life over the city. For example, in "The Poet," he states that "if thou fill thy brain with Boston and New York, with fashion and covetousness, and wilt stimulate thy jaded senses with wine and French coffee, thou shalt find no radiance of wisdom in the lonely waste of the pinewoods." In *Nature*, he says that "the tradesman, the attorney comes out of the din and craft of the street and sees the sky and the woods, and is a man again." They obviously need the natural world for their spiritual health, for wisdom, integrity, and courage. Emerson also argues the advantage of the country-life "for a powerful mind, over the artificial and curtailed life of cities." And in "Self-Reliance," he warns over and over again that society and "dead" institutions deprive people of their "precise" or individual selves by forcing conformity and opposing self-reliance.

These passages, of course, clearly indicate some of the advantages of the country life: its beauty, its naturalness, its wisdom and harmony with the Spirit of the Universe, and its opportunities for solitude and independence. They also reveal many of the dangers of the city life: its artificiality, materialism, fleshly pursuits, blind conformity, and disharmony with the Spirit of the Universe. But these passages must be considered in the context of Emerson's statements about the *dangers* of the country life and the *advantages* of the city life.

In "The Poet," Emerson identifies two categories of people who love nature and spend time in the country: "poets and men of leisure and cultivation" and "hunters, farmers, grooms and butchers." The first group--the "poets and men of leisure and cultivation"--are clearly formed by the cultural and intellectual life of the city although their love for nature leads them to spend time in the country. They, at least potentially, are capable of enjoying the advantages of both urban and rural living while avoiding the dangers of both. The second group, however--those who work with animals and the soil--are formed *only* by the country and reveal the serious dangers of the solely rural life. Such people, according to Emerson, are "sympathetic" to nature; they worship nature with what he calls "coarse, but sincere rites." But they have no awareness above the primitive level of their specific lot in life; they have no consciousness of the divine essence of the universe.

In his essay "Farming," Emerson describes the farmer as a person of "uncorrupted behavior"; but the behavior is the uncorrupted behavior of animals and young children. In other words, there is an unconsciousness in the farmer's natural virtue, which even at its best limits the level of moral awareness and of spiritual development that can be reached. This person of "endurance"--the farmer--may have "a great health, and the appetite of health," but will never read Tennyson and can never appear in palaces or in drawing-rooms, where one usually finds the most cultivated minds. The farmer is not capable of the mental growth, does not have the intellectual appetite, necessary to grow in spiritual awareness. In fact, Emerson is aware that the influence of his much-beloved nature on the farmer is similar to its influence on the child, that "of subduing and silencing him." He acknowledges that, in general, the "city boy" possesses a "finer perception" than the "owner of the wood-lot."

Thus, it is clear, as Emerson explains in *Nature*, that a person can own a farm, can work a farm, but not own "the landscape"; that is, such a person may not be able to experience the farm as a part of the Organic Whole, may not be able to experience "the landscape," what Emerson defines as the "integrity of impressions made by manifold natural objects." In fact, the farmer will very likely have only a fundamentally physical relationship with nature. The limitations of the life of the soil, then, are severe in Emerson; and a person who has lived *only* a life of the country does not seem able to rise above a primitive, brute, or dumb level of existence.

On the other hand, the great *opportunity* of city life for Emerson is that the city is the personal creation of people, an expression of the mental powers of humanity; and the great *advantage* of city life is that the city offers unexcelled possibilities for realizing mental development. The city itself is the expression of many individuals' ideas. Emerson explains, "We are made of ideas. Let the river roll which way it will, cities will rise on its banks." Simply, the city is "but an aggregate of incongruous materials which have obeyed the will of some man." In his essay "Success," Emerson argues that "there is no prosperity, trade, art, city, or great material wealth of any kind, but if you trace it home, you will find it rooted in a thought of some individual man." And the human mind will endlessly create. Cities will rise and fall: "Cities of men are like the perpetual succession of shells on the beach."

But the city is not only humanity's expression of ideas; it is also a source of ideas. The city is the place where individuals realize much of their intellectual, cultural, and aesthetic potential. In fact, Emerson writes, "the test of civilization is the power of drawing the most benefit out of cities." In describing the "best of cities," Boston, in a poem about a group of Bostonians who camp in the woods, Emerson notes:

> we praise the forest life:
> But will we sacrifice our dear-bought lore
> Of books and arts and trained experiment,
> Or count the Sioux a match of Agassiz?
> O no, not we! ("The Adirondacs")

The natural world simply cannot offer what the urban world created by human beings can offer; and the individual simply cannot afford to ignore the city for *only* the country. In "Farming," Emerson says that "cities force growth and make men talkative and entertaining." In the cities are the men "who are the centres of energy, the driving-wheels of trade, politics, or practical arts, and the women of beauty and genius." In addition, Emerson explains, these men and women are the "children or grandchildren of farmers, and are spending the energies which their fathers' hardy, silent life accumulated in frosty furrows, in poverty, necessity and darkness." The contrast between the lot of the farmer--silent, impoverished, dark--and that of the farmer's offspring is striking. Clearly the severe limitations of the farming life appear to be a necessary first stage in human development. But clearly, too, the energy, genius, and beauty which belong to the children and grandchildren are more desirable--both in day-to-day existence and in the possibility that men and women will ultimately realize their true nature.

In his essay "Culture," Emerson writes that "a man should live in or near a large town . . . . Cities give us collision. . . . The best bribe which London offers to-day to the imagination is that in such a vast variety of people and conditions one can believe there is room for persons of romantic character to exist, and that the poet, the mystic and hero may hope to confront their counterparts." In his *Journal* he muses, "Great cities, enormous populations, if they be paddy populations, are disgusting, like the population of cheese, like hills of ants, or swarms of fleas[,] the more the worse. But if they contain Merlins & Corneliuses, Friar Bacons, & Crichtons, if roadmakers, mathematicians, astronomers, chemists; good kings like Alfred; poets, like Chaucer, inventors, farmers, & sailors, who know the elements, & can make them work, memories, imaginations, combinings, perseverances, arts, music, architecture, nations of Spartans, of Athenians, of English, aristocratic men, & not maggots; then the more the merrier. Open the gates, let the miracle of generation go on." Obviously the city offers a level and kind of life which are essential to men and women of consciousness. Ideas and projects flourish; minds are stimulated. The city expands the individual's capacity to think and to imagine; it helps to prepare each person for the greatest mental leap, the intuitive leap in which a person experiences a consciousness of Oneness with the Organic Whole, the Universal Spirit.

Thus, as the few passages we have examined suggest, Emerson clearly sees dangers and advantages both in city and country life. One might ask, if Emerson *had* to choose between the city and the country in a person's life, what choice would he make? I suggest that he would choose the city.

Certainly there are at least two reasons why Emerson would fear eliminating the country from a person's life. First, Emerson believes that the city and the country educate differently. In his *Journal* he explains that "the city delights the understanding. It is made up of finites; short, sharp, mathematical lines, all calculable. It is full of varieties, of successions, of contrivances. The country on the contrary offers an unbroken horizon . . . the objects on the road are few and worthless[;] the eye is invited ever to the horizon & the clouds. It is the School of the Reason." The city, then, is most significant in educating the intellectual powers, what Emerson calls the "Understanding"; the country, in educating the intuitive powers. This difference would pose difficulties for Emerson if he had to choose between the city and the country since, on the one hand, those in the country who have not developed their mental capacities (in the city) cannot rise above a primitive awareness of the nature of the Universe; but, on the other hand, those who *have* developed their mental capacities need the country to unleash the intuitive powers through which they experience a sense of Oneness with the Universe.

The other difficulty for Emerson in choosing the city over the country is that Emerson believes that human beings--because of their preoccupation with material matters and their susceptibility to societal pressures--have become estranged from the Over-Soul, from the One which is the Universe. He believes that each person is, in short, "a god in ruins." The reason that "the world lacks unity, and lies broken and in heaps, is because man is disunited with himself." Nature, on the other hand, is still in harmony with the Over-Soul; only Nature is "inviolable" to humanity. Nature, not having the kind of consciousness of the material and societal worlds that humans do, is a pure reflection of the Over-Soul. People need, then, to immerse themselves in elements of the natural world in order to attempt to transcend their corrupt individual selves.

Despite these problems, however, I still believe that Emerson would choose the city over the country if he *had* to make a choice--because he would argue that the natural person cannot transcend the primitive level of existence in the natural world alone, but the urban person can experience the natural world through visits to the country or even through glimpses of the natural world in the city. Emerson's most famous description of one of his transcendental moments, in fact, is a description of an experience which he had crossing Boston Common. He feels that "all mean egotism vanishes. I become a transparent eyeball; I am nothing; I see all; the currents of the Universal Being circulate through me; I am part or parcel of God." The person in the city does not even need a common, however, to make contact with nature. Such a moment can occur, as Emerson explains in *Nature*, in the solitude found in the streets of a city when one *simply looks up at the stars* (italics mine). Two of the critical components of the transcendental experience, then, are an individual capable of mental and spiritual consciousness and growth (which usually only the city can provide) and some element of the natural world (which can be found in the city or country).

Ideally, of course, Emerson would not want to make the choice between city and country. He feels that people living deeply spiritual lives—ones in which, during moments of solitude, they experience transcendental Unity or Oneness with the Universe--need both to be part of their experiential history. In fact, one of his strongest defenses of the railroad is that the railroad gives people access to both the city and the country:

> I conceive the value of railroads to be this, in education, namely, to unite the advantages of town & country life, neither of which we can spare. A man should live in or near a large town; because, let his own genius be what it may, it will repel quite as much of agreeable & valuable talent as it draws; &, in a city, the total attraction

> is sure to conquer first or last every repulsion, & . . . [win] the most improbable hermit within its walls, some day in the year. In the town, he can find the swimming school, the gymnastic teacher, the chemist, the music, the dancing master, the shooting gallery. Opera, ballet, & panorama, Agassiz, Lyell, Webster, & Lafayette . . . . In the country, he can find solitude & reading, manly labor, & cheap living, moors for game, hills for geology, & groves for devotion.

The richness of a person's experience (urban and rural), then, can have a decisive effect on the quality of the person's spiritual life. The experience of as many as possible of the forms of Essence enables an individual to learn "the laws of the universe." Yet these experiences have as their *primary* role in a person's life the transcending of these very experiences. As is clear in all of Emerson's essays, the important element in the relationship of men and women to the Universe is less their surroundings as such than their inner selves and, more particularly, the harmonious relationship they have established between that inner self and the outward world, which is a form (city or country) of Life. To experience the meaning of the Universe, its Unity and Oneness, people must adjust, that is, integrate, the "inward and outward senses." Basically, what they must realize is that their "genius," the "divine idea which each of us represents," is within, not without--and thus their surroundings are not decisive. As Emerson says, "the moment I *am*, I despise city and the seashore, yes, earth and the galaxy also."

THE HUMANITIES OF THE CITY

City Courses at San Francisco State University Today

For the last 25 years, the Humanities Department at San Francisco State University has offered a remarkable variety of city courses, including Los Angeles, New York, Paris, London, Florence, Rome, Vienna, Beijing, Hangchow, Hong Kong, Tokyo, Kyoto, Cairo, Timbuctu, Leningrad, and Mexico City. The success of the "City Humanities" courses has been one of the brightest spots in the university's general education program. On a more pedestrian but very real economic note, the "Humanities of the City" courses often account for more than half of the department's total FTE figure every semester.

But the very success of these courses has raised a number of questions: Why do these courses succeed? Should the courses be organized primarily by historical, geographical, or thematic concerns? What are the points of intersection with the interdisciplinary social sciences, which have long recognized the validity of urban studies? And finally, should we be content to teach the masterworks of San Francisco and Paris, or should we be searching for larger perspectives concerning the overarching characteristics of the city?

WHY DO CITIES COURSES SUCCEED?

A class devoted to the study of a particular city seems to offer our students a more cogent focus for study than traditional categories such as "Baroque" or "Medieval Culture." A city is real, a place they can visit, a unit of study with definite physical boundaries that appeals to the logic of the eye. Many students have trouble imagining that they can enter into the Medieval world; but they can be convinced that a study of Paris will give them access to the Middle Ages in a way that makes sense to them.

City courses possess another advantage over many courses with topical or thematic approaches. A "theme" course often carries the burden of arbitrariness: "Why this course on love, or revolution, or nature? Is this just the professor's own intellectual obsession? And why these works and not others?" The professor chooses the city, too, of course; but the definiteness of the city gives the course an objective grounding not always visible (or present) in theme courses.

The admirable intention of making theme courses multicultural only exacerbates the problem. Many, if not most (or even all) students have only the vaguest notion of the historical development of their own culture. To choose works from other cultures without giving them the cultural grounding for understanding the works produced there is asking for trouble: confusion, shallow understanding and superficial coverage of the subject. By virtue of its very unity, the city course is grounded in a single culture; but the multicultural makeup of almost all great cities gives the teacher and students chances to branch out into multucultural perspectives without losing the unity provided by the study of a single city. This "city" approach to multicultural perspectives has its limits, of course. Understanding Algeria or Martinique solely through the historical, social, and artistic currents of Paris does not exhaust the riches of these other cultures, and in fact may well give a biased or limited view of them. But it is a view, and can be evaluated and criticized within the context of Parisian intellectual life.

City courses can also revitalize subject matter that seemed, in the maelstrom of the last two decades, ready to expire. A striking instance of such a resurrection is our Rome course. Offered as a "Roman Culture" class within the Western Civilization sequence, the course never drew more than 10 or 12 students (and often no more than 5-6, whereupon administrators would begin harumphing for the cancellation of the class). The class seemed primed for the executioner's axe. As a city class, Rome now attracts 45-50 students. One major difference, though, is that the old course stayed exclusively in the time frame of classical Rome. The city course deals with Renaissance Rome—and even, on occasion, with Fellini's Rome—as well. Now students can relate the Rome of Augustus to the Rome of Michelangelo, and both of these incarnations of the city to a Rome they can actually visit today.

But by far our most successful application of the "Humanities of the City" concept has been the San Francisco course. The Humanities Department at San Francisco State University now offers between twenty and twenty-five sections a year (including summer and winter sessions), with a combined enrollment of over a thousand. It is clear that many students, some of whom are first-generation Americans, regard this course as one of the most vital of their entire educational experience. "Biography of a City: San Francisco" is their apprenticeship into the culture of their home city. The course gives them their grounding in the heritage of architecture, poetry, photography, park design—in short, some of the major humanistic endeavors in the city where they live.

Humanities programs at other urban universities might especially profit from the San Francisco example. One of the most real communities of any student—and faculty member—is the city where they live, learn, and work. This straightforward fact gives the teacher a considerable strategic advantage in presenting the humanities of the home city. For example, in his American Studies course on Washington, D.C., Professor Howard Gillette of George Washington University is able to draw on the rich architectural and social resources of the D.C. area to enrich his course. A course at

14 2

California State University, Northridge, offers a look at the culture of Los Angeles as depicted through films made in Hollywood—a surefire mixture of autobiography and fantasy. The possibilities are endless.

ORGANIZATION OF CLASS MATERIAL

Because the study of cities is so new to interdisciplinary humanistic study, no established methodology for organizing class materials exists. Should the governing logic be historical? geographical? thematic? I would argue that the basic structure, at this time, should be both historical and humanistic—that is, that great works should form the core of study, and that these works should be presented in the most universally accessible format: namely, a historical sequence.

There is a tendency, established by venerable tradition, to treat literature as the core of all humanistic study (see, for example, A.S.P. Woodhouse's article, "Humanities," in the current edition of the *Encyclopedia Britannica*). In a study of the humanities of the city, however, it is architecture that must receive primary attention. Specifically, every major city symbolizes its character in three major architectural manifestations: its **public parks**, its **city hall**, and its **signature building**.

In its parks, the city shows us how it plays. Charles Olsen (*The City as a Work of Art*) believes that "societies better reveal themselves at play than at work." Even if we are unwilling to grant play this degree of primacy, it is clear that the ways in which a municipality provides for the leisure of its people symbolize what the leaders of that city consider best and proper recreation for the soul. The nature of plantings, the proportion of "culture space " (museums, ball parks, etc.) to recreated nature invariably reveal what the collective spirit of the city—or, at least, the will of the authorities—believes to be the proper relation of humanity to nature.

A city hall is an explicit statement about the reverence for the past, the ambitions and pretensions of the present, and a beacon for the future. A city hall tells us where the historical core of the metropolis lies. Location, height, arrangement of interior space and exterior ornamentation—all these elements point to the inner and outer symbolism of the city as it moves through time. A city hall is the formal announcement of the soul of the metropolis.

Every city has a signature building: a single structure that defines a skyline, and thereby sets the theme and mood of the city's character. In the early years of a city's growth, it is usually a religious building that dominates the landscape: the temple at Luxor, the great ziggurat at Borsippa, the Hagia Sophia. In the passage of time, massive palaces and ambitious public buildings may come to rival the temple's dominion over the cityscape. In North American civilization, commercial buildings have grown from modest structures to colossal hives of enterprise, lording it over their cities and symbolizing the paramount importance of business in the life of the nation.

THE SOCIAL SCIENCES AND THE HUMANITIES

The social sciences have long recognized the validity of urban studies. But it is clear that social scientists and humanists have different goals in mind when they come to the study of cities. There are numerous points of overlap or contingency, of course. But social science urbanologists have as their focal point of study such issues as policy analysis, health care, public transportation, housing development, social services, and legal systems. They are interested in urban people and phenomena in the mass.

Humanists generally begin and end their enquiries with the study of individuals: not "the 19th-century Parisian middle class" but Charles Baudelaire or Eugène de Rastignac; not "publicly-accessible land use in 19th-century New York," but Central Park . Individual works form the core of the humanist's study of cities, just as they do for all of the traditional categories of humanistic study. Furthermore, these works are not studied solely with a view to understanding the city: the city is also studied with a view to understanding the experience of individuals within it.

I want to emphasize that I'm not putting the humanistic approach above or below the methods and aims of social sciences. I am only concerned to find out in what fundamental respects they differ. Ideally, of course, the two views should complement, not conflict with, each other.

THE SOUL OF THE CITY

Though a humanities course emphasizes the study of individual great works, it seems to me that a city humanities course must also search for understanding of **the city itself as an individual**. In the study of any city, the humanist's choice of works should reveal what Spengler identified as "The Soul of the City"—that unique combination of outstanding, overall characteristics that differentiates Paris from Berlin, or Los Angeles from San Francisco. Here the question of *style* emerges at once. Whether we borrow or invent a definition, we must have some such notion before us as we study **the totality of significant attributes** in the literature, fine arts, philosophy and history of the city being studied.

I am aware that many humanists are wary of drawing out such large-scale generalizations about cultures in general or cities in particular. My own view, though, is that the venture must be made. Students far better understand and appreciate the parts—appreciate their value, their sense in the overall picture—when they see them as manifestations of the whole. Once these attributes are grasped, students (and their professors) will have a deeper, more insightful understanding of the nature of the city, and what they can do to maintain and augment its heritage for future generations.

Beyond the Pursuit of Geographic Trivia: Using U-Haul's *America's Moving Adventure* to Teach About Physical and Cultural Landscapes

A challenge that faces educators at all levels is to find ways of teaching students that are meaningful and memorable and that do not treat the students as receptacles into which knowledge is poured. The ideal is to provide learning experiences that lead students to discover and to organize information for themselves. This paper examines one such way in which students can learn about the physical and human landscape through analyzing and interpreting the graphic designs that appear on the sides of U-Haul vehicles. These graphics are part of U-Haul's campaign *America's Moving Adventure* designed to promote U-Haul's services by making their vehicles more visible and unique. Initially U-Haul developed one set of graphics: this consisted of one graphic for each state, each graphic depicting a nationally recognizable scene found in the state. Later a second set was produced, not only for the fifty states but also for each of the Canadian provinces. This second set depicted scenes more regionally recognizable.

Although geographic education was not initially a goal of U-Haul's campaign, the symbolic representations of each state provide the basis for a variety of learning experiences applicable at a range of levels from elementary through introductory college classes. This paper explores different educational uses of the U-Haul graphics, beginning with those suggested by U-Haul. This is followed by suggestions on how to use an inquiry approach to teach about the places depicted in the graphics through developing the students' higher level thinking skills. The intent here is to show that *how* the graphics are used and analyzed can lead to very different levels of geographic knowledge and understanding of the states and of the country as a whole, beginning with geographic trivia but moving on to higher levels of geographic understanding.

The present U-Haul campaign offers a number of opportunities to teach geography. As their campaign has evolved, U-Haul has used the Super Graphics logos to develop games with both entertainment and educational value. As designed by U-Haul, these games teach recognition and recall of geographic facts or trivia, such as state names, boundaries, historical events, and national symbols. Given the growing recognition of geographic illiteracy in the United States, development of the educational aspects of the Super Graphics campaign is both timely and valuable. Some of these ways have been recognized by U-Haul, and incorporated into their advertising campaign for use outside of classrooms. Others, such as those that will be suggested here, can be developed by classroom teachers to build upon the foundations laid by U-Haul.

The earlier educational games developed by U-Haul came in the children's coloring book *Movin' On* (U-Haul, 1988) that featured, among other things, games that test children's ability to match the Super Graphics with the correct states, and other games that call for recognition of the patterns formed by the intersection of borders between states. Later U-Haul produced *America's Moving Adventure Travel Game* (U-Haul, 1989). This features a board game map of the United States surrounded by boxes for each state. A set of U-Haul Super Graphics stickers is provided. During people's travels, whenever they see a U-Haul moving van, they are to peel off a sticker that matches the picture on the van and paste this sticker in the appropriate game board square. This game has great value in teaching the names of states, their location on the map, and the abbreviations for the state names. Additionally, people become familiar with the scenes depicted in the Super Graphics and thus have a visual image of something about the state to reinforce their memory of the state name.

Games such as this are powerful ways of reinforcing knowledge that may otherwise be forgotten if learned by rote. This knowledge is important *provided* that it is not seen as an end in itself, but rather as the foundation upon which geographic understanding can be built. This knowledge can be reinforced through the ongoing practice provided by repeated exposure to the trucks and their symbols. People retain much more information when visual images accompany what is learned. The competitive element further serves to reinforce the learning. This learning will take place on an ongoing basis outside of formal classroom settings, whenever people see U-Haul trucks. Thus what students learn in elementary school can be practiced well beyond these early years, even without the accompanying board games, for as long as the U-Haul trucks are on the road.

The educational value of the U-Haul campaign does not stop at the level of recognizing state symbols and memorizing state names. The Super Graphics can be used as the basis for creative lessons that employ an inquiry teaching approach. By analyzing the graphics, students can discover for themselves a wealth of information both about the individual states and about the country as a whole. Using this approach, a teacher could begin a unit or course on the United States by having the students examine each of the Super Graphics and generate a list of ideas about what they interpret about each state from its graphic. The ideas generated will vary depending on the level and background knowledge of the students. For example, looking at the graphic for Pennsylvania, a student with little background in U.S history might not be able to infer much from the picture of the Liberty Bell, but could recognize that the state is mountainous and that farming is practiced there.

Regardless of the depth of their analyses, students will be able to generate lists of information about the country and the states. The next step could be to analyze the lists for broad themes or categories under which ideas can be grouped. Some examples of such themes could be sports, music, farming, physical features, climate, and national symbols. At this point it would be valuable for the class to discuss what could be inferred from the themes about the nature of the society. For example, the image of the United States (as presented by U-Haul) is of a country in which most of the people are white and in which sport is a popular pastime, practiced mostly by white men.

Once students have shared their interpretations of the graphics, it is then important for them to examine what they have discovered to see if what is represented or inferred accurately represents the country and its states. For those students who already have some background knowledge about the country, an important issue to explore at this point could be what is *not* represented in the graphics, but *could* have been—such as the multicultural nature of the population, or the negative aspects of society, such as homelessness and the use of drugs.

A final step in using the Super Graphics to teach about the country could be to take the themes generated earlier and to plot these on a map, using a method similar to that employed in the first section of this paper. In a classroom setting, students could select their own symbols to depict the themes that they have chosen, such as a flag to show a graphic depicting a national symbol, or jagged peaks to depict mountains. Once these have been placed on the map, the map can be analyzed to see what spatial patterns emerge. For example, using the category of national symbols, an analysis of the map shows that most of these symbols appear in the graphics of the eastern states. This piece of information provides a valuable point of departure for discussing *why* national symbols occur more in the east, leading students to learn about the settlement of colonists along the eastern seaboard of the country. The map also shows clearly the nature of the physical landscape: students can see that a band of mountains is found in the east of the country and in the west, with a broad flat area in between. A look at an atlas can lead students to confirm their hypothesis, and to learn the names of these different mountain ranges.

This same spatial analysis can be used for generating and testing a variety of hypotheses about both the physical and cultural landscape of the United States. Such an approach not only teaches knowledge about the country, but also teaches important map skills and skills of inquiry, analysis and problem solving. By beginning with ideas that the students generated, it gives them a sense of ownership for their learning, since *they* identified what they would learn about, and not the teacher. Further it provides a means whereby the teacher can discover what the students already know. This is important so that the teacher can design subsequent lessons to teach information and skills that students have not yet learned and also avoid teaching material they already know.

The educational value of the U-Haul campaign need not stop with the study of the United States. Once students have studied the U.S. following the inquiry approach described here, they can use the same idea in designing their own graphics to depict different regions within their own immediate area or to depict other countries throughout the world. Alternatively, they could gather pictures, particularly from travel magazines, about other parts of the world. They could examine these pictures, using the same inquiry approach that was taken using the U-Haul symbols. In this way they would teach themselves about the places depicted.

As shown here, the U-Haul campaign can be used as a valuable tool for geographic education. It is important to note, however, that geographic education should *begin* with a knowledge of place names, locations, symbols and other "geographic trivia," but should then move on to higher levels of geographic understanding. Symbols or graphics—as idealized views of people and places—are important starting points; however, just *knowing* these symbols must not be seen as the goal or the end of what needs to be learned. These images need to be examined critically, because by nature symbols create and perpetuate stereotypes. Used in this way, as educational tools and points of departure for further discussion, they become invaluable in teaching not only recognition and memorization, but also higher-level skills and understanding.

AN INTERDISCIPLINARY *WANDERUNG*

Vacations involving either stasis or high speed--lying on a beach or skiing the moguls--punctuate our hurried indoor lives. But I still remember my years of living in Germany, when the usual weekend and vacation activity was a *Wanderung*, and extended leisurely but engaged walk--not the shuffle to the corner and back after a big meal that passes for a walk in this country, but an hours-long exploration of the countryside. The experience of a *Wanderung* may be as foreign to us as the word itself (*ramble* comes closer than *walk* or *hike* as a translation). Introducing students to the *Wanderung* helps them to consider not only a pace but also a mode of experiencing the environment.

The *Wanderung* emerged, unplanned, as one of the keynotes of a team-taught interdisciplinary course, "Romanticism in the Arts," which I coordinated this past semester as part of our All-University Curriculum. Among the assigned works were several Wordsworth poems; Mary Shelly's *Frankenstein*; paintings by Constable, Turner, and Friedrich; Beethoven's *Pastoral Symphony* (#6); Schubert's *Die Schöne Müllerin*; and Berlioz's *Symphonie fantastique* (like Beethoven's, a program symphony; students received copies of the programs). The biographical sketches and letters we read were full of *Wanderungen*, whether close to home like Constable's or further afield like Turner's. Thayer's *Life of Beethoven* describes Beethoven's returning on "a long ramble through the scenes in which he had composed his Fifth and Sixth Symphonies," while Wordsworth says he wrote "Tintern Abbey" "after a ramble of 4 or 5 days" with his sister (students were still more struck by Wordsworth's three-month walking tour of Europe, including the Alps; none of us could match that). In the works themselves, we frequently found ourselves looking at wanderers (asking, for example, why Friedrich's *Wanderer above the Mists* was chosen for the cover of our *Frankenstein* text), reading their thought (e.g., in Wordsworth's "I Wandered Lonely as a Cloud" and "Stepping Westward," or the chapters on Frankenstein's revisiting the Chamounix area), and listening to them (e.g., Song #1 of the *Müllerin*, "Das Wandern ist das Müllerin Lust" [Wandering is the Miller's Delight]). Once early on, I asked a student to demonstrate a *Wanderung*, to the music of Hugo Wolf's "Fussreise," from his *Mörikeleider*. Our antiquated record player, with an invisible switch set erroneously at 78 rpm, gave us a good laugh as she took on the pace most of us had just used in our goal-directed effort to get to the class on time--a good

14 '9

discussion starter for what a *Wanderung*, by contrast, entails.

Many students at first assumed that art, literature, or music written by or portraying wanderers would essentially be "painting a picture" of the landscape, the scenic backdrop. Beethoven, in the *Pastoral Symphony*, includes movement titles that suggest what listeners might imagine, but in his notes, he emphasizes that the work is "a matter more of feeling than of painting in sounds." The piano part in the *Müllerin* is pictorial, creating images of the brook and the mill wheels, but it is not just imitative, becoming rather, as Alfred Einstein notes in *Music in the Romantic Era*, "a kind of painting with the emphasis upon feeling." Each song emphasizes a lyrical moment of high feeling. Schubert sets the words "Das Wandern, das Wandern" to expressive leaps in pitch, conveying the emotions of the wanderer. In "I Wandered Lonely as a Cloud," students needed encouragement to move beyond imagining the colorful dancing daffodils to notice the emphasis on the persona moved by them; or again, in "It is a Beauteous Evening, Calm and Free," to see the emphasis on the speaker's and the child's responses rather than the picture of sea and setting sun. Like many other Romantic painters, Constable places human figures out of the center of the action. But he elicits the viewer's emotional response to the scene by using nature as the prime agent of feeling. Turner's experimental techniques, as he blurs details and outlines and plays with color, convey, as Kenneth Clark puts it, "pure sensation."

Looking at expressions in various media of the Romantics' *Wanderungen* led students to ask the great questions familiar to scholars and philosophers but newer to them:

> --Is nature a dead mechanism or a living organism? Students saw supposedly superficial "tools of the artist's trade" as conveying a world view. Constable's characteristic white flecks, "Constable's snow," give his landscapes a sparkle and pulse of life. Wordsworth's personifications of nature, in such poems as "Lines Written in Early Spring," are more than simply "ornaments" of speech. What, then, of the conversation in the *Müllerin* between the miller and the brook: are they simply a conventional, sentimental poetic device, as has been claimed?
>
> --Is the individual a separate entity amidst nature or part of a whole? In "Tintern Abbey," Wordsworth writes of "a motion and a spirit" in "the round ocean and the living air, / And the blue sky, and in the mind of man." In "Das Wandern," the repeating piano figure transforms a simple folk melody, carrying it on top of a rhythmic dance, as the miller sings of having learned his rhythm of walking from nature in motion. The miller joins the water, the mill wheels, even the stones in their dance of life. Constable's snow enlivens animals and people as well as the landscape they inhabit; in contrast, Friedrich often portrays the human figure as quite distinct from the landscape, as in the *Wanderer Above the Mists*, although he encourages us to emulate the person's engrossment with the landscape by showing him from the back.
>
> --What would merging, "losing oneself" in the landscape involve? The Miller merges with the brook in death, an escape from the world of change, loss, and pain, but the speaker in "Tintern Abbey" is "laid asleep in

1410

body/And becomes a living soul," experiencing ecstasy, not death. Note the duration of the merging in each case. Despite some students' accusation that Wordsworth is advocating retreat from active life, this poem and others indicate clearly that such moments do not, cannot last.

--Is there a divine presence in nature? In what sense? Can our encounter with the landscape help us toward a sense of meaning in life? Wordsworth's description of a "presence," a "spirit" in all things ("Tintern Abbey"), echoes Beethoven's statement that "every tree seems to say holy holy." For Friedrich nature is symbolic of a spiritual reality; he once commented, "The Divine is everywhere, even in a grain of sand; here I have represented it in bullrushes."

--What if nature ceases to act on us, leaving us entrapped in our problems? Consider, for example, Coleridge's "Dejection Ode"; Song #19 of the *Müllerin*, where the Miller tells the stream it does not know the pain of love; Part III of the *Symphonie fantastique*, "Scene in the Country," where the young musician finds renewal but then confronts again the *idee fixe*, the theme of his beloved, and his obsessive, destructive love; or *Frankenstein*, where both Frankenstein and his creature "dare to be happy" in nature but then fall back into torment.

Such explorations may, in fact, take students beyond scholars' usual territory by drawing a wider range of interdisciplinary comparisons, bringing composers and other writers and artists into the kind of juxtaposition often reserved for Wordsworth and Constable or Turner. Our discussion revealed many connections, but also the distinctiveness of the various disciplines' responses to the landscape. Resisting students' initial tendency to reduce the Romantics to an amalgam of nature lovers, the course demonstrated that wanderers, their motives, their discoveries, their ways of expressing their feelings, come in many forms.

To be sure, students do not spend the entire semester considering only the mode of the *Wanderung*. At times the focus is on the moment, whether the intense "spots in time" of Wordsworth or Turner (made possible by a Wanderung?) or the anti-life stasis of ships locked in ice in Friedrich's *Arctic Shipwreck*, Coleridge's "The Rime of the Ancient Mariner," or *Frankenstein*. At other times, the emphasis is on extremes: for example the storms in the added fifth movement of the *Pastoral Symphony*, in *Frankenstein*, and in such Turner paintings as *Hannibal Crossing the Alps* or *Snow Storm, Steam Boat*. A key image of the Romantic artist, Turner lashed to a ship's mast during a storm, complements that of Wordsworth or Constable wandering through the beloved Lake District or Stour Valley scenes of their childhood.

Interestingly, many students in the course found works or parts of works portraying the extremes more accessible than those describing the *Wanderung*, a preference crossing disciplines. They became impatient with the leisurely paced parts of Beethoven, Schubert, and Berlioz as well as with Wordsworth's descriptions of the gifts a walk can bring. They could be quite critical as they watched some Romantics adopting a pace that would not get them ahead in the world. All the more reason to look at the *Wanderung* if

1411

some students perceive it as alien, even threatening, to their values. When reading Wordsworth's "The World Is Too Much with Us," some students persisted in their interpretation that "Getting and spending/We lay waste our powers" means "If you earn money and then spend it all, you waste it." Even after acknowledging the poem's direct statement, "Little we see in nature [not 'in the bank'] that is ours," they were not concerned. We are often indeed "out of tune," our world "moves us not," perhaps partly because, unlike the Romantics, we have not allowed ourselves a pace that encourages that tuning.

The *Wanderung*, then, offers insight across the disciplines into lives and works where landscape is more than a two-dimensional backdrop to human drama. And the *Wanderung* is not a bad term to keep in mind during an interdisciplinary course, which sometimes takes students more at the superhuman speed of the Ancient Mariner's return trip from the pole (the only way the Mariner could endure that pace was to sleep...). As faculty begin teaching such courses, trying to master unfamiliar disciplines, they too may feel more on a driven, high-speed chase than on a *Wanderung* through familiar or new fields. Students and faculty alike profit from a leisurely but active interdisciplinary *Wanderung*, seeing how artists in diverse media have found expression for their relationship to the landscape they have given themselves time to explore.

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

CACHE OF COURSES

Teaching Environmental Literature: Materials, Methods, Resources. Edited by Frederick O. Waage for the Modern Language Association of America, 1985. Reviewed by Sharon Scholl, Jacksonville University.

Here is THE book if you are searching for useful, tested curricular models and suitable humanities and environmental materials. I have only one caveat: the volume is limited to literature, ranging from scientific to imaginative; interdisciplinary humanities courses would need integration of examples from fine arts, religion, and philosophy. However, the core of a worthwhile course could certainly be extracted from the wealth of ideas in Frederick Waage's book.

The editor allays our fears concerning several issues. He admits that environmental writing can be ideological, but denies that it is by nature radical or anti-establishment. He confronts the familiar accusation that integrated humanities courses are merely frills or elitist pretensions, asserting that the sorts of courses the book includes demonstrate the practicality of the humanities and the relevancy of science to life.

Part one presents essays of philosophical and historical interest on such themes as the concept of environment, the background of American environmental thinking, leading writers (Marsh, Powell, Muir, Burroughs), and an analysis of the "nature book." Part two describes courses that historically survey environmental literature and stress the changes which have taken place in our thinking about nature.

As to specific inclusions, Ralph Lutt's "Views of Nature" considers the major themes of American naturalists and essayists. Students keep a journal, construct their own polished piece of nature writing, and create a research paper on nature literature, thereby entering the work of nature writing.

Barbara Bell's "Humanity in Nature" course, team-taught with a biologist, explores our varied relationships with nature (Challenger, Sharer, Seeker, Skeptic). The philosophical and practical difficulties of the course are frankly discussed, as are the rewards: refreshing variety, changes in students' value systems, transferability of materials and techniques to other in-

14:3

structional settings. Jack Kligerman describes a course planned around field trips in the New York-New Jersey area and student essays and journals synthesizing these experiences with their reading.

Part three describes approaches to teaching nature writing with diverse student groups. Betsy Hilbert's students come without rural experience and begin to understand that world through reading environmental literature and creating their own essays and audio-visual programs. Paul Bryant combines an historical survey of nature writing from the Old Testament to Edward Abbey, with student nature writing based on these models. His weekly laboratory features field trips and writing workshops. Margaret McFadden's course concentrates upon personal spiritual development through nature in the style of Thoreau and Annie Dillard.

Part four offers details of courses physically located in some wilderness setting. Most are short term affairs, typically over a January interim semester, but one is a year-long trek. Part five offers plans for more localized scope, including courses centered on the Glen Canyon Dam, Mississippi River, and New England. The book concludes with a valuable list of works cited, additional significant works, environmental bibliographies, information centers, and helpful organizations.

This small paperback Frederick Waage has put together is indispensable for anyone who contemplates assembling a course on the theme of nature. It is as strong in bibliographic citations as in presentations of methodology. One should not attempt the long labor of planning an integrated course in this topical area without arming oneself with this excellent volume.

ECO-CENTRIC ETHICS

Nash, Roderick Frazier. *The Rights of Nature: A History of Environmental Ethics*. Madison, Wisconsin: The University of Wisconsin Press, 1989. 320 pp. $27.50. Reviewed by Bron Taylor, University of Wisconsin, Oshkosh.

The animal liberation front sets free animals in research laboratories in England and the United States, a man chains himself to the banks of a river about to be flooded by the filling of a new dam, two Icelandic whaling ships operating in violation of international agreements are sunk, conflict and violence flares over the "tree-spiking" of old growth redwoods by those intent on preventing such logging. Such acts of civil disobedience and sabotage are rapidly increasing throughout the United States and the world. While the most sensational exploits of the "eco-saboteurs" have been covered in the media, few understand the fundamental shift in moral values and overall worldview underlying not only this emerging radical environmentalism, but also underlying much of the broader environmental movement.

Roderick Nash's *The Rights of Nature* provides a highly accessible path into the intellectual roots of what he believes is "one of the most remarkable ideas of our time: the belief that ethical standing does not begin and end with human beings" (p. xi)--the idea that nature itself, "or parts of it, has intrinsic worth which humans ought to respect" (p. 4). He traces how such beliefs are leading increasingly to actions designed to "liberate" nature.

Nash begins with a prologue helpful to those with little background in ethics, and asserts that the evolution of moral history has increasingly seen the web of moral concern cast more widely--from the family alone, to tribe, to region, to nation, to one's gender or race, and increasingly beyond racial and gender divisions to the human family at large. But now, even while this extension remains imperfect with regard to the human community, thinkers are pushing "ethical extension" beyond human beings to animals, ecosystems, and Earth itself. In an evenhanded manner he examines streams of Western thought both hostile and sympathetic to nature, and suggests that the natural rights tradition so important in the West has become a key source for what can be called an "eco-centric" ethics or worldview, particularly when these ethics are combined with an assault on Descartes' dualistic, anthropocentric worldview.

Nash then reviews the origins of North American environmentalism, illustrating how, on the one hand, mainstream conservationists such as Gifford Pinchot (the first professional forester in the United States) have based their efforts on utilitarian and anthropocentric premises (conserving nature to insure the efficient long-term utilization of resources to benefit human beings), while, on the other hand, for diverse reasons, increasing numbers of environmentalists now base their environmentalism on an eco-centric worldview which stresses the "intrinsic-worth" of either animals, ecosystems, or both.

The central part of the book provides an extremely well documented overview of the diverse rationales underlying the emerging eco-centric worldviews: examining the contributions of the ecological sciences, religion, and philosophy to the emergence of contemporary environmental ethics based on such worldviews.

Nash's overview examines the tensions between two key factions within contemporary radical environmentalism. Some stress animal rights while others stress the right of ecosystems (Earth itself) to survive. Some from the animal rights faction fear that a strictly ecocentric perspective leads to "environmental fascism"--the erosion of individual animal (including human) rights--by placing the good of the ecosystem over the survival rights of individual animals. Nash thinks, however, that these factions may find common ground: the animal rights faction may be willing to include all of nature in the moral community, at least as habitats, and the ecocentric emphasis can be seen as compatible with emphasizing the value of individual lives, because such lives are an interdependent part of the intrinsically valuable ecosystem. (Nash downplays how some ecocentric thinkers and literature express sentiments which view individual lives not as a necessary part but more as a destructive parasite on ecosystems—the term "breeder" sometimes is even used pejoratively.) Nash emphasizes that both factions promote a radical shift for environmentalism—there is an increasing emphasis on mounting a liberation struggle on behalf of nature (and/or animals)—reflecting a move beyond the anthropocentrism and compromise both factions claim characterizes the mainstream environmental movement. Nash provides a fascinating portrait of the emerging eco-guerilla movement.

Many readers will be unaware of the landscape Nash reveals--but not for long. Social conflicts grounded in contending moral assumptions about the value of nature promise to be exacerbated by increasing awareness of the stakes involved in competition over limited Earth resources. This book provides a window into the increasing social conflicts over our relations with nature. While it leaves aside many ethical questions, it nevertheless provides an indispensable primer for all environmentally concerned persons as well as ethicists and other academicians who have been preoccupied in other areas and who wish to make quick inroads into an understanding of environmental ethics. Since it examines the contributions of many disciplines to environmental ethics, those teaching interdisciplinary humanities courses will find it especially helpful. The book can also provide students in upper-level courses which deal with environmental policy or history with a background into the moral dimensions of contemporary environmental controversies.

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity, humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use WordPerfect). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

EDITOR'S NOTES

After the two thematic issues of *Humanities Education* on landscape that were so ably edited by Steve Adams, we return to a more mixed selection of articles. And yet, as so often happens, there are unplanned for common topics. Ken Egan examines the literary history of the gothic story with cross-disciplinary insights into psychology, sociology and technology. Kyle Crocker and Nancy Erickson recount their experience with a team-taught honors course that caused some keen self-evaluations. Brother Philip Valley, on the other hand, tells of his plan to formalize evaluation of interdisciplinary humanities courses. John Lawry, a psychologist who was "flattered" into teaching a humanities course provides ideas for making classwork more profoundly personal, and Alan Farrell reflects on how it feels to be in a class with a teacher who is a master at interpersonal involvement in language and life.

1421

REMINDERS TO NAHE MEMBERS

When you renew your membership, please note that the annual rate for four issues has been $20 since January 1990.

Mark your calendar for NAHE's biennial convention in Lafayette, Louisiana, April 19-21, 1991. It promises to be an exciting program.

Ken Egan, Jr.

THE GOTHIC: CONFRONTING OUR CULTURAL DOUBLE

> *". . . the gothic tradition provides an ideal opportunity to reexamine fundamental values in western culture through interdisciplinary study."*

The Gothic has been a persistent literary mode since the mid-eighteenth century. Originating in the sentimental sensibility of the British and American Enlightment, Gothic fiction has adapted itself to changing cultural scenes in Great Britain and the United States. The mode's durability is proven by its contemporary popularity. Not only is Stephen King featured on the cover of *Time* (October 6, 1986), but a highbrow writer such as Joyce Carol Oates feels compelled to remark: "Gothicism, whatever it is, is not a literary tradition so much as a fairly realistic assessment of modern life" *(Newsweek*, September 29, 1969, 120). Yet the Gothic has long been treated as the stepchild of literary creativity, the ungainly cousin who does not fit our pet assumptions about highbrow literature. We are used to considering Mary Shelley's *Frankenstein* an entertaining sport rather than a serious commentary on the limits of romantic desire. Poe has often been dismissed as appropriate reading for an adolescent mind (to paraphrase T. S. Eliot's famous put-down).

But if we take the Gothic seriously we make crucial discoveries about history, the self, and the cross-disciplinary significance of literature. This neglected literary form estranges familiar, daylight reality and so exposes our confident self-assertions to doubt. The Gothic represents the repressed or obverse side of official culture in each major cultural epoch of the past two hundred years. To demonstrate this claim I will track the Gothic mode from eighteenth-century England to 1960's America. Such a task requires a willingness to approach Gothic texts from diverse perspectives, for each epoch puts the Gothic mode to unique uses. If the Romantics utilized the Gothic to challenge prevailing ethical and psychological norms, late Victorian writers adapted the mode to their social concerns. Thus the Gothic tradition provides an ideal opportunity to reexamine fundamental values in Western culture through interdisciplinary study.

But beyond this scholarly appeal, a study of Gothic fiction speaks to our students' present concerns. It is often adolescents who flock to such comic Gothics as *Ghostbusters*, read Stephen King's latest thriller, and absorb the Gothic trappings of MTV videos. Clearly Gothic devices reflect psychological and sociological anxieties, preoccupations we can help our students manifest and critique. This historical survey, then, provides the teacher with a repertoire of strategies for analyzing this important literary subgenre in the classroom. Further, given the interdisciplinary significance of the Gothic, instructors in such disciplines as philosophy, psychology and history might consider using a relevant Gothic text to raise central issues for discussion.

I. Lewis' *The Monk*: Archetypal Gothic

Unlike Gothic fiction itself, which so often focuses on mysterious origins, a study of the Gothic can precisely locate a point of origin: Horace Walpole's *The Castle of Otranto* (1764). By its two "Prefaces" and by its form, this eccentric, often laughably far-fetched book defined the salient features of the Gothic: the tragic fall of the protagonist; the clash between beautiful and sublime effects; the victimization of the sentimental heroines; and of course, the appeal to terror. In the process Walpole generated a proto-narrative, an almost cartoon-like *story* minus development of any sort. We might say that he created a pure form lacking in content, except that it would be more accurate to say that he remained on the conscious, conventional level of his material, allowing later writers to "complete" the prototype by discovering the repressed possibilities of the form.

Matthew Lewis' *The Monk* is the first text to fulfill the promise of *Otranto*. Lewis' novel is a veritable cornucopia of Gothic horrors, a guidebook to the land of madness that will become familiar terrain for Poe, James, and Pynchon. Published in 1796, *The Monk* is the first great Gothic fiction, a text which swerves the genre away from prototype to archetype. To call it archetypal is, first, to assert its status as a powerful influence on later Gothic writers. However, "archetypal" refers to a more profound imaginative dimension as well, to that well of images stored in the collective unconscious. *The Monk* comfortably occupies the dreamscape of romance, generating a series of primal images of horror and desire. Finally, the novel is archetypal in summoning mythological figures representative of persistent Western values.

In *The Secular Scripture*, Northrop Frye has described the archetypal universe of romance. Basing his model on the assumption that Western romance is a displaced version of Biblical narrative, Frye (97-98) discovers in romance a hierarchical universe:

Heaven
Eden
"Ordinary world"
Hell/Underworld

Lewis' tragic protagonist Ambrosio tumbles down this mythological hierarchy. His name hints at a heavenly or divine birth. When we first meet him, he occupies a pre-Fall Eden, a garden world in which he confronts no true temptations. He is at the height of his powers, renowned thoughout Madrid for his twinned virtues of chastity and eloquence. However, his inevitable fall is set into motion when a young monk reveals that he is in fact she: Matilda, having penetrated the abbey, reveals her loveliness and her lust. Converted from an innocent to a troubled man by Matilda (who turns out to be a succubus), Ambrosio begins his pursuit of his sentimental victim, Antonia.

One of the key ironies in this novel is that while Ambrosio plays the part of Satan to Antonia, he is himself the dupe of an elaborate temptation by Satan himself. Through much of the novel Ambrosio appears "amazed," that crucial Miltonic term for spiritual confusion. Having fallen into the ordinary world following Matilda's seduction, Ambrosio journeys into the night world, spending sleepless nights yearning for the innocent Antonia. Much of the middle section of the novel takes place in night reveries and surreptitious meetings between the monk and his victim. In the descent into the vaults leading to the rape of Antonia, we witness a rehearsal for Ambrosio's actual descent into hell at the end of the novel.

In addition to this archetypal plot structure, *The Monk* alludes to key mythological figures. As already suggested, Ambrosio's sophistic seduction of Antonia recalls Milton's eloquent Satan tempting Eve to her fall. The numerous references to magic and pacts with the devil clearly point to that Renaissance archetype, Doctor Faustus, representative of the monomaniacal quest for knowledge and power at whatever cost. Further, Ambrosio's abduction of Antonia hearkens back to Pluto's abduction of Persephone. These mythological types reveal themselves in a supercharged romance landscape. The novel is dominated by darkened, maze-like settings; dream visions and poetic interludes provide entryways into the unconcious. Indeed, reading the novel is similar to entering an elaborate dream from which we cannot quite wake ourselves. *The Monk*, then, is a Pandora's box of spiritual nightmares. It is not surprising that the novel appeared in the 1790's, a decade of terror in France as the classical restraint of the neoclassical epoch came down. Lewis' novel signals a culture in crisis, a culture cut loose from its moorings.

II. Shelley's *Frankenstein*: Ethical Gothic

Because the Gothic describes the consequences of crossing boundaries, it often raises issues of ethical conduct. *The Monk* indirectly addresses such issues, but given the novel's cynical, even decadent tone, readers never really concern themselves with the immediate question: is Ambrosio acting morally here? Instead, the reader becomes a voyeuristic accomplice to the action. Mary Shelley's *Frankenstein* (1818) never allows the reader such a comfortable position vis-a-vis its tragic protagonist, Victor Frankenstein. In contrast to the sensationalist rhetoric of Lewis' novel, *Frankenstein* is written in an abstract, philosophic discourse which coaxes the reader to reflection. As such, this Gothic is typical of its author's upbringing and of the cultural epoch in which it emerged. After all, as daughter of William Godwin and Mary Wollstencraft, Shelley had been nurtured in radical politics of the late-eighteenth century. Furthermore, as wife to Percy Bysshe Shelley she attempted to live out a High Romantic dream of a profound sentimental love between male and female, a love

1425

celebrated by Percy in *Prometheus Unbound*. Thinking in broader cultural terms, we recognize that the novel raises questions about a Byronic Romanticism which celebrates the human will's combat with cosmic law. Indeed, *Frankenstein* must be read as Mary Shelley's attack on one version of the Romantic from the point of view of another; if Byron could sympathetically characterize such frustrated Faustian characters as Manfred, Shelley could only feel scorn for that character's inhumanity.

Both through the character of Frankenstein and through its very structure, the novel calls into question the values of "the modern Prometheus" (to cite the novel's subtitle). Victor Frankenstein, a precocious, speculative man, desperately pursues his dream of reanimating inanimate matter. Initially fired by the alchemist's quest to discover the key to life, Victor begins a series of experiments in applying Galvanism to the regeneration of matter. Similar to Ambrosio, Frankenstein spends increasing amounts of time among rotting, putrid corpses, surely suggesting that his pursuit of eternal life could only lead back to death by roundabout means. Having poured body and soul into the creation of his monster, Frankenstein turns in disgust from his "Adam," offended by its ugliness. This rejection of the self-made child is only the first of many indications that this modern Prometheus is lacking in that most basic of human drives, sympathy.

Unlike Lewis, who never really takes sentimental values seriously, Shelley clearly sees sympathy as a lynchpin of psychic and social health. Victor not only rejects the being he has made, but he does nothing to assuage the monster's desire for companionship. In his remarkable personal narrative, the monster pleads for a companion, claiming that only a sympathetic mate could free him from rage toward humans. But Frankenstein balks at the monster's request, thereby setting the stage for the monster's murder of Elizabeth at the novel's end. As Robert Kiely observes, "the monster may well be taken as Frankenstein's alter-ego, his strange and destructive self, which finds no adequate means of communication with others, no true resemblances, no reciprocation, a repressed and hidden beast for whom all acceptable forms of human commerce are unavailable and therefore hateful" (170).

If the monster is Frankenstein's homicidal double, we must further conclude that Victor is a misogynist. First, he has attempted to usurp the female procreative function by creating a human being outside the boundaries of sex. Secondly, he allows the faithful servant Justine to go to her death for the murder of his younger brother, a murder his surrogate has committed. His lame excuses for not intervening cannot justify his silence in the face of certain death for his female servant. Third, as we have already noted, Frankenstein refuses to create an Eve for his outcast Adam. And finally, Elizabeth's death seems an enactment of Victor's unconscious desire, for throughout the novel we are made aware of his unspoken animosity toward this compassionate female character. In Victor's character, then, the reader observes and is compelled to meditate upon the consequences of a blind, unsympathetic male will-to-power.

Frankenstein provides a clear instance of a Gothic text designed to involve the reader in ethical reflection. All the while exploiting Gothic conventions of terror, the text aims beyond simple thrills; instead, it uses terror as a wedge into the ethical structure of Byonic Romanticism. Applying Kathryn Hume's taxonomy of fantasy functions, to turn from *The Monk* to *Frankenstein* is to move from a literature of illusion to a literature of vision (57). Whereas Lewis' text allows a retreat to a magical universe, Shelley's raises value issues in her contemporary culture. Further, these questions center on the status of women in a culture dominated by Bryonic values. As we shall see, this woman-centered Gothicism has persisted into later historical periods, including our own.

III. Poe's "Usher": Psychological Gothic

To turn to Edgar Allan Poe is in one sense to return to the issues raised in *Frankenstein*, for Poe inherited the Byronic Romanticism attacked by Mary Shelley. But it is also fair to say that Poe steps outside the ethical norms of sentimental culture, introducing radical notions of a perverse, self-destructive psyche which anticipate modern psychological theory. To demonstrate this relationship between fiction and psychology, I will read Poe's "The Fall of the House of Usher" against two Freudian texts: "The Uncanny" and *Beyond the Pleasure Principle*.

In the former Freud hypothesizes that "everything is uncanny that ought to have remained hidden and secret, and yet comes to light" (130). Put differently, we experience the uncanny when that which was once familiar now reappears as unfamiliar, "for this uncanny is in reality nothing new or foreign, but something familiar and old-established in the mind that has been estranged only by the process of repression" (148). Among many instances of the uncanny, Freud describes two of particular importance to our reading of Poe: the double and the repetition compulsion. He observes that the double originally figured the immortal spiritual self in ancient cultures. However, over the course of history the double has come to represent multiple meanings: death itself, the conscience, and even the ego's unfulfilled longings. The "repetition compulsion" is that instinctive urge to repeat ceaselessly a gesture or a behavior. In Freud's post-World War One writings the repetition compulsion took on increasing significance, for the theorist speculated that this urge to repeat pointed to a drive even more primal than the pleasure principle. In *Beyond the Pleasure Principle*, Freud hypothesizes that an urge to return to origins underpins human behavior. That urge is expressed symbolically not only through the repetition compulsion, but also by sadistic love. In short, Freud points to a death instinct which overrides even the drive for pleasure through sex.

Poe's "The Fall of the House of Usher" narrates that which Freud describes. The story is recognizably Gothic in setting and protagonist, yet Poe gives a new twist to character psychology by moving beyond sentimental versions of the self. Roderick Usher is locked in a nightmare of doubling. The House of

Usher doubles the family name and even the Usher physiognomy. The "lurid tarn" the narrator pauses to observe doubles the house. Most importantly, Madeline is Roderick's twin double. Oppressed by this mirror reality, Roderick desires to bring the nightmare to an end. He is driven by the death instinct, the urge to return to an original condition of cessation and peace. That instinct reveals itself in his compulsive behavior: he is drawn to specific colors, specific sounds, specific rooms, specific gestures. But of course the most explicit indication of his death instinct is his premature burial of Madeline. What better way to bring this hall of mirrors crashing down than to murder his sister and so end the possibility of an incestuous duplication of the family line? However, in a truly uncanny conclusion, the repressed sister returns with a vengeance, enacting Roderick's own suicidal wish by grappling him to the floor, ending his life. Roderick's death wish culminates in the total collapse of the House of Usher. The narrator's closing description signals the fulfillment of Roderick's desire: "While I gazed, this fissure rapidly widened--there came a fierce breath of the whirlwind--the entire orb of the satellite burst at once upon my sight--my brain reeled as I saw the mighty walls rushing asunder--there was a long tumultuous shouting sound like the voice of a thousand waters--and the deep and dank tarn at my feet closed sullenly and silently over the fragments of the 'HOUSE OF USHER'" (157).

"Usher" is by no means unique among Poe stories in anticipating Freudian themes. Poe's stories mark a decisive shift in the form and tenor of Gothic fiction, for Poe advances the "interiorization" of Gothic terror. That is, Poe's fiction concentrates on the psychological sources of terror, forcing the reader to *experience* a character's madness, often triggering a self-reflexive analysis of the reader's own psyche.

IV. "The Yellow Wallpaper" and *The Turn of the Screw*: Sociological Gothic

Moving beyond Poe historically we leave behind the era of "High Gothicism," the cultural epoch which assured the Gothic of an audience and a rationale. Yet surprisingly Gothic fiction does not disappear. In fact, the mid- to late-Victorian period generated a remarkable number of Gothic fictions, including Stevenson's *Strange Case of Dr. Jekyll and Mr. Hyde*, Wilde's *The Picture of Dorian Gray*, and Stoker's *Dracula*. Perhaps the two most sophisticated examples of late-Victorian Gothic are Charlotte Perkins Gilman's "The Yellow Wallpaper" (1892) and Henry James' *The Turn of the Screw* (1898). The former is an instance of the Poesque psychological uncanny, while James's novella is the single best example of a fantastic tale which does not permit a definitive answer to the question: are ghosts real? Even as we acknowledge both writers' debts to Poe, however, we must note a more explicit concern with the social conditions of the protagonists.

In *Fantasy: The Literature of Subversion*, Rosemary Jackson places the Freudian themes we have just examined in a social context. She argues that "it is in the unconscious that social structures and 'norms' are reproduced and sustained within us" (6). Jackson concludes that fantasy literature (of which Gothic fiction is a type) "traces the unsaid and unseen of culture: that which has been silenced, made invisible, covered over and made 'absent'" (4). By opening up to view the repressed unconscious, Gothic fiction not only describes abnormal psychology, but the social forces which produced that psychology. In this way Gothic fiction exhumes the repressed social relations which condition our values and conduct. "The Yellow Wallpaper" exemplifies Jackson's sociological interpretation of the Gothic. As Jackson situates Freud in a historical context, so Perkins Gilman recasts Poe. Her short story revises "The Fall of the House of Usher" by renarrating the Usher story from the point-of-view of the female victim. The implicit feminist themes of *Frankenstein* are revoiced, here in the words of the victim herself, the imprisoned housewife. We track her descent into madness, reading her strained effort at recording her mental condition. The reader discovers that John, the narrator's physician husband, is enforcing a "rest cure" on his neurasthenic wife. Convinced that cessation from imaginative activity will restore his wife's "maternal" soundness, John keeps his wife under close supervision in a former nursery (complete with window bars!). The narrator's imagination responds in a predictable manner: it projects its desires onto the yellow wallpaper, gradually converting the fictive "woman behind the wallpaper" into a double for her own desires. This imaginative transformation climaxes in the wife's inability to distinguish her imaginative double from herself. In Jackson's terms, the narrator has released "that which has been silenced, made invisible, covered over and made 'absent.'" The narrator achieves her pyrrhic revenge at the story's conclusion, for John, upon coming face-to-face with inescapable proof of his wife's madness, lapses into that most "feminine" of gestures: he faints.

On the surface *The Turn of the Screw* may seem an altogether different "sport" from "The Yellow Wallpaper." While Perkins Gilman's story clearly falls within the category of the uncanny, James's fiction offers the possibility of actual ghosts. But the novella's point-of-view offers a key to the similarities between the two fictions: we hear the governess' own account of what occurred in that "gingerbread" estate, and so are in the position of diagnosing or interpreting her psyche. Clues abound that, similar to the "mad woman in the attic" in "The Yellow Wallpaper," the governess's perceptions have been conditioned by her social station. We know, first, that the governess is the youngest daughter of a poor parson, and further, that she felt subservient to her brothers: "I had had brothers myself, and it was no revelation to me that little girls should be slavish idolators of little boys" (194). We also sense that the governess is swept off her feet by "the master," her handsome bachelor employer. Fueled both by repressed desire for the master and by repressed rage at her social dependency, the governess attacks her job with zeal. Her psychological problems are compounded by her reading of Gothic romances, texts which provide a fantasy scaffold for her repressed emotions. Under these conditions it seems hardly surprising that the governess "sees" ghosts representative of sexual sin.

Furthermore, given her status in Victorian culture, it is not surprising that she should perversely cast herself in the role of the savior for the children. Sublimating her combined desire for and rage toward the master, she transforms herself into the protector, bent on saving the children from demoniacal Quint and Miss Jessel. However, her duties as savior take a curious turn at the conclusion: she apparently suffocates Miles. She finally, completely enacts her anger by destroying the master's male ward.

Writers of the modernist and contemporary eras have found sociological uses of the Gothic similar to those of Perkins Gilman and James. In "A Rose for Emily," Faulkner narrates the "mad tryst" of Miss Emily Grierson with the corpse of Homer Barron. In Shirley Jackson's *The Haunting of Hill House* (1959), Eleanor journeys to a maze-like mansion to participate in Dr. Montague's psychic experiments, only to become trapped in a curious love relationship with the house itself, a relationship which culminates in her death. This series of Gothic fictions focused on female protagonists points to an intrinsic feminist drive in this literary mode. In its initial eighteenth-century and Romantic phases, the Gothic described abuse of sentimental female characters by willful overreachers. Mary Shelley exploited this convention to raise questions about specific male-centered values. Writers of the late-nineteenth and twentieth centuries have developed Shelley's critique by openly investigating the social origins of female madness. Because the Gothic gives free rein to fantasy, symbolic representation of desire and rage, the Gothic mode provides an ideal vehicle for examining the distorting effects of patriarchal culture on a female psyche. Perhaps this is why the drugstore Gothic continues to sell so well among a female readership.

V. Pynchon's *Crying of Lot 49*: Postmodernist Gothic

We began our examination of the Gothic mode with Joyce Carol Oates's remark: "Gothicism, whatever it is, is not a literary tradition so much as a fairly realistic assessment of modern life." The current vogue of the Gothic bears out Oates' claim. During the 1970's and 80's writers such as Stephen King, Jay Anson, and Peter Straub have reproduced the terrors of contemporary living in their charged magical narratives. Writing in a "naive" Gothic form which never raises doubts about the supernatural, these writers tap into a sense of cultural malaise, a feeling of total system failure in the aftermath of 60's violence, the Watergate debacle, an energy crisis, and the continued threat of nuclear holocaust. Combined with the popularity of horror films and the drugstore Gothic, these Gothic fictions mark an age in crisis, similar to that of Lewis' 1790's and James' 1890's. We seem to have arrived at a *fin de siecle* despair prematurely, suggesting perhaps that an epoch of technological alienation and nuclear dread experiences accelerated cycles of optimism and pessimism.

One can rightfully ask whether contemporary Gothic provides sheer escape or meaningful reflection on our experience. Thomas Pynchon's *The Crying of Lot 49* (1966) provides a compelling example of contemporary Gothic moving beyond the merely sensational to the meditative and sociological. Pynchon's fiction occupies a postmodernist universe, a universe of the abyss, of floating signifiers, of characters lacking unitary identities in a decentered world. Pynchon excavates the prototypical Gothic narrative elements to tell the story of Oedipa Maas's descent into postmodern American madness. In Hume's taxonomy, Pynchon's novel is aptly categorized as a fantasy of disillusion, a fiction which "attack[s] the reader's assurance directly by trying to persuade us that our judgment is inadequate to the challenge of interpreting reality" (137). As a sophisticated revision of the entire Gothic tradition, *The Crying of Lot 49* makes a fit conclusion to this survey of Gothic fiction.

Oedipa Maas is the archetypal tragic hero of the novel. Named after that greatest of Western puzzle-solvers, Oedipus the King, Oedipa must track a labyrinthine series of clues to solve the mystery of America. Like Oedipus, she comes to discover that "curing" America's plague means solving herself, for she has internalized the blindness of official culture. The text invokes the mythological characters of Rapunzel and Persephone to figure Oedipa's journey from the tower of middle-class comfort into the shadow world of countercultural America. In Pynchon's novel, all of America becomes the Gothic structure, the Monk's abbey, Usher's house and the governess' estate rolled into one. Her deceased guide into this nightworld is Pierce Inverarity, whose name perhaps signifies "piercing untruth." Oedipa's former lover, Pierce has named her executrix of his will, a will that is the key to a complex web of financial transactions, all pointing toward an underground mail system labeled W.A.S.T.E. ("We Await Silent Tristero's Empire"). Oedipa attends a production of a seventeenth-century revenge tragedy, visits a gay bar, takes a night journey through San Fransico, all in pursuit of this elusive underground organization. Finally, by dint of desperation, a series of incredible coincidences, and careful detective work, she discovers that "Tristero" was the name of an underground mail service in early Renaissance Europe, a service which later transposed itself to America.

But having come this far in her quest, Oedipa and the reader are denied a final solution to the question: does Tristero really exist, or is W.A.S.T.E. a diabolical practical joke by Inverarity? (We recall that his name may also signify "untruth.") In deconstructive terms, Oedipa has tracked a signifying chain lacking a center or origin. After all, Tristero is absent, silent, a silence emblemized by its symbol of the muted horn. The radical undecidability of signs leads to a reversal of American middle-class hierarchies, the hierarchies of inside/outside, sanity/insanity, culture/non-culture. The shadow America is not merely *another* America, an excluded alternative; that shadow America infects from the inside "official" culture. So it is that Oedipa's disc jockey husband goes insane, driven over the edge by LSD and despair. So it is too that Dr. Hilarious, Oedipa's psychologist, becomes a raving maniac, thus demonstrating that the healer is himself the patient. Denied virtually all her male supporters, this

1431

female quester journeys into the abyss: "That night she sat for hours, too numb even to drink, teaching herself to breathe in a vacuum. For this, oh God, was the void. There was nobody who could help her" (128). Inhabiting the void, Oedipa adopts the strategy of dancing on the margin, or, in the text's terms, the method of the paranoid: "For there either was some Tristero beyond the appearance of the legacy of America, or there was just America and if there was just America then it seemed the only way she could continue, and manage to be at all relevant to it, was as an alien, unfurrowed, assumed full circle into some paranoia" (137).

While Pynchon's text reproduces distinguishing features of the Gothic (the tragic protagonist, an investigation of the consequences of crossing culturally-sanctioned boundaries), it also seems to mark a terminus beyond which the Gothic cannot go. After all, this self-conscious postmodernist text calls into question a distinction fundamental to the Gothic effect: romance and reality. Pynchon's America is entirely fantastic; caught in the web of Oedipa's discovery, the reader must conclude that there is no escaping the void. There is no safe haven to return to after our trip into *The Crying of Lot 49*. If the Gothic traditionally justified itself as just such a path of retreat and return, then perhaps the Gothic has lost its *raison d'etre*. However, in another sense, Pynchon's text leaves the Gothic mode undisturbed, for it relies upon a root Gothic emotion: dread. As G. R. Thompson has written, "The chief element of the Gothic romance is not so much terror as, more broadly, dread--whether physical, psychological, or metaphysical, whether of body, mind, or spirit." (34). Dread in all its forms is an enduring emotion in Western culture. Because Gothic fiction represents and incites that emotion, its two-hundred year stint as the unpleasant relative come home to remind us of our limits and our desires will surely continue. In the post-postmodern the Gothic will no doubt flourish.

[This essay developed out of a Summer Seminar for Schoolteachers funded by the Montana Committee for the Humanities during the summer of 1987. My thanks to the Committee for its support. I would also like to acknowledge the contributions of seminar participants Margaret Abbott, Terry Curry, Jane Gebhardt, Deborah Stoltz, and Audrey Thompson.]

HUMANITIES EDUCATION CONNECTIONS

Ideas and materials for better teaching and learning in the humanities.

Kyle R. Crocker
Nancy C. Erickson

REPRESENTING THE NEW HUMANITIES: SOME ISSUES AND PROBLEMS OF EVALUATION

The 'brave new world' of current interpretation is an incredibly dense one, and very meaningful connections can initially seem irrelevant or forced.

When through the course of 1988-89, we designed and implemented a treatment of the Bemidji State Honors core course, "Studies in Literature and the Arts," our two-fold purpose was to "represent" or model current, revisionist theory and practice in the various humanities disciplines, while preserving the aspect of exposure to traditional "classics" in an historically linked, multi-disciplinary manner. In formulating the precise content and interpretive approaches of the course, we were guided by several assumptions shared by "revisionists" of whatever stripe -- feminist, Marxist, social materialist or new historicist. Paramount among these are the cultural "embeddedness" and socially transformative function of the object or text, and the ideologically "situated" character of any historical representation or interpretation. These features, we believe, are distinctly opposed to historically "backgrounded" yet essentially universalist or idealist accounts, and to any notion of an ideologically neutral presentation. At base, we want to share with the freshman students our understanding of the multiplicity of ways in which contemporary oppositional work in the humanities represents a style of cultural critique, *not* to convert them to any particular position or mode, but rather to alert them to these views, and to enable them to animate their own criticality.

We chose as our arena Europe in the nineteenth century; the offering was subtitled, perhaps inadequately, "A Cultural History of the Nineteenth Century."

This decision was predicated on several criteria. In part we needed simply a period in some sense historically contained, through which we could refer to the matter of the classical humanities materials mentioned in the section above. The nineteenth century enfolds an abundance of the orthodox "isms" or stylistic categories that have plagued general humanities studies, providing a foil for testing the usefulness of our approach. It provides a multitude of materials, canonical and non-canonical, from which to select and has become a key area of focus in recent scholarship, seemingly open to multiple interpretations. The nineteenth century also provides historical distance for us and our students, while not being so far removed from our present time as to appear entirely foreign, peculiar, impenetrable. Indeed it allows us to incorporate and address the thematic question of the nature of "modernity."

The course work included three major literary works which we chose because of their representativeness, and also because of their accessibility as examples of the points we intended to make with our students. These were Goethe's *Sorrows of Young Werther*, Dickens' *Hard Times* and Ibsens's *A Doll's House*. The students were provided with a packet of individual art reproductions and numerous photocopied handouts of poetical and shorter texts. The course format included lectures, informal classroom presentations, as well as large and small group discussions.

The weekly units included: the later eighteenth-century background (Enlightenment and Revolution); changing romantic forms and themes within the changing social formation; the romantic "worship" of nature as the pursuit of otherness (with a culminating discussion of Goethe's *Sorrows of Young Werther*). As a platform for launching the midterm, we looked at "self and society" in the earlier nineteenth century, moving directly to the sociopolitical crisis at mid-century: "Realism" vis-a-vis Courbet and Flaubert, the industrial balled in Britain (that meeting was entitled "Poverty Knock"). Modern life as spectacle included Hausmann's and Manet's Paris and the opera of Verdi and Wagner, with another culminating discussion of Dickens' *Hard Times* focusing on the question of audience. Our general discussion of images of Victorian woman presented both visual and poetic themes, while the meeting, "All That is Solid Melts Into Air," examined Arnold's "Dover Beach" and Impressionist painting. We discussed issues of naturalism and emergent feminism vis-a-vis Ibsens's *A Doll House*. We concluded with a session on conflicting currents of the "Fin de Siecle," focusing on disillusionment in Nietzche, Gauguin and the Symbolists.

The meeting entitled "'Types and Symbols of Immortality' -- The Romantic Worship of Nature" was typical of our approach to both the selection of primary materials and multiple interpretative treatments of them. With the general theme already advanced in a previous lecture, we moved directly to a discussion of 'canonical' Romantic elements in Wordworth's *Ode: Intimations of Immortality from Recollections of Early Childhood*. Having led this discussion to psychological themes of nostalgia, alienation, and loss in Romantic Nature poetry in general, we introduced excerpts from Dorothy

Wordworth's diaries to problematize the relationship of gender, experience and privileged/marginalized literary form. Shifting to the painting of John Constable, we sketched the biography and had the students 'inventory' the motifs and mood of Wordworthian Nature in *The White Horse* and *The Haywain.* The meeting concluded with our modeling an 'ideology critique' of these paintings, focusing on the 'naturalization' of the laborer in a time of agrarian conflict and Constable's landscape as paradigmatic of new industrial modes of production.*

Our audience consisted of enthusiastic freshman honors scholars who might be characterized as classic over-achievers. The group was homogeneous, almost entirely white, rural or semi-rural, provincial and basically Protestant middle-class. This shared background added to their identification with one another while their honors status established them as somehow separate from their fellow freshman. As a group they shared expectations carefully honed in their academic experience which may in itself have been difficult for us to surmount.

We chose to evaluate both the students and the effectiveness of our methods through a variety of instruments, specifically designed and/or modified to fit the structure and intent of the course. We prepared essay questions which at once would incorporate the students' knowledge of standard nineteenth century cultural objects and "readings" while at the same time inviting demonstrations of their understanding of the critical models which we had been representing throughout the lecture and discussion sessions. In other words we employed traditional essay testing with distinctly different thrusts directed to both an understanding of orthodox approaches *and* an application of "new" interpretive models. Similar direct questions were aimed towards more informal reflection in the required "day-book" or personal journal. Here the students could not merely regurgitate a set of memorized facts, but were required to stretch beyond that surface content to reflect an understanding of the implicit ideological frameworks of these cultural representations. Through both the journals and class discussion, small group and large, we encouraged them to grapple with the complex issues involved in the creation, reception and interpretation of our essential materials.

Our evaluation tools indicated to us that the course had yielded positive and problematic results. Perhaps the most surprising of these was the students' acceptance and even affirmation of a central point of the course, that all cultural objects are embedded in a specific network of historical, material practices. Other encouraging signs included an immediate embrace of the non-canonical materials incorporated, particularly the popular industrial ballad, and a surprisingly positive response to many of the canonical musical selections, especially, and oddly enough, an extensive passage from Wagner's *Gotterdammerung.* And we somehow preserved our credibility as instructors through continued assaults on the students' own values, their received ideas of the sacrosanct nature of art.

There were, however, some distinctly problematic results as well, and these lie at the very heart of the course's broader concerns. In spite of our efforts at the beginning to delineate carefully our objectives, a perhaps inevitable "information question" arose in the mid-quarter evaluation. Painfully prominent in the responses to the evaluative question, "What about this course has been the best at helping you learn," was the reply, "I don't know what I am supposed to know." As familiar a litany as this undoubtedly is to all introductory course instructors, in our context it posed a particular problem. There was a persistent question in the minds of the students about how the real "business" of the course was to be extrapolated from the seemingly extraneous discussion of historical material circumstances or the investigations of ideologies embedded in, shaping and being shaped by, the cultural object/text. As scholars working in the shifting, expansive methodological terrain of post-structuralism, we all must sympathize. What as instructors, for example, must we have read in recent Flaubert studies before discussing *Madame Bovary* with a class? Researching Constable's work in the 1820s, what aspects of rural social life do we investigate: patterns of land tenure, the poor rate, coach timetables, nuances in the artist's remarks about his father? Everything? The "brave new world" of current interpretation is an incredibly dense one, and very meaningful connections can initially seem irrelevant or forced. The problem is likely endemic in a course of this nature; the issue is a real one.

Still, our response constituted a "failure of nerve." We reacted by devoting altogether too much class time to reiterating orthodox "facts" and "labels." While the students seemed reassured and satisfied for the present moment, what had happened, in fact, was that we had moved away from a part of our initial motivations and had played into their hands by providing too much "fully patterned" information. In the midst of this "retreat," we were reading the midterm examinations in which its consequences were already manifest. On the whole, the students dealt adequately, sometimes very effectively, with an orthodox, synoptic question directed at essential content and its traditional patterning. This was:

> The 'storm and stress' period in German art can be considered as formative to many aspects of High Romanticism ca. 1800-1850. In what ways does Goethe's *The Sorrow of Young Werther* "anticipate" the spirit and themes of nineteenth century Romantic poetry, painting and music? In what ways might later Romantic sensibility change? How is the emancipation of the individual represented in the Romantic scheme?"

In our marginal remarks we made the typical suggestions of using specific examples, and so forth. (These questions, incidentally, all appeared on predistributed lists of possibilities.) The second question was more open-ended, socially connective and critically probing. Addressing identified slides of Constable's *Wivenhoe Park* of 1816 and Turner's *Rain, Steam, and Speed* of 1844, the question asked students to "briefly compare and contrast the paired works with attention to how they manifest significant shifts in attitudes and audiences, form and content, social realities and ideologies."

The resulting essays were dreadful. In spite of personal access to the works (as well as the question!) beforehand, ample "background" material on the economics of enclosure and industrialization, etc. foregrounded in lecture, and even straight-forward modeling of a social materialist analysis of Constable's *Haywain*, these essays occasioned only superficial remarks on the breakdown of conventional forms, at best, and at worst, dribble about "feelings" and personal preferences for representational painting.

This difficulty in developing a sense of criticality was still marked at the time of the final in spite of a heightened appreciation of the complexity of the project and an increased facility in addressing the materials. Since we were already "pulling our punches," it was really no surprise for us that a parallel problem emerged in another dual set of essay questions here. Marked improvement was evident at least at the informational, synoptic level in responses to alternative questions:

> "1) Along broad but historical lines, compare and contrast Dickens' novel *Hard Times* and Ibsen's play *A Doll House*. Remember to address matters of *context* (shifting social values, audience, etc.) as well as *form* (authorial voice, narrative structure, characterization, etc.). Refer to additional comparative works wherever you think they may be useful. 2) It can be argued that a changing sense of the "the Modern" emerges in European culture between 1848 and 1900. Using contrasting pairs of works we've studied, define what you think are the central themes and issues of Modernity in the later nineteenth century. What are the "new" values, social and ideological conflicts, and changing artistic ways of dealing with them?"

But, both at a more reflective, interpretive level in these, and abundantly throughout the second essay on *our* relationship to the culture of the nineteenth century, there was a widespread inability to incorporate any of the critical models under discussion, and indeed a collapse of "criticality" in general.

We found a pervasive indication of the students' attitude of historical superiority and their perception that they as individuals living in the 1990's could see through the obviously misguided follies of the inhabitants of that earlier age. In a sense, our humanities study as cultural critique had backfired. They felt self-satisfied enough to cluck their collective tongue at the wrongheadedness of their nineteenth century counterparts, while all the while smugly basking in the self-assurance that civilization had indeed strode forward out of the darkness into the shining neon glitter of their world. They were unable or unwilling to accept any connection between them and the events of the 1800's.

What we were encountering was an ideological impasse which centered on the reign of progressive, evolutionary models in the students' thinking. Their sense of historical superiority affected their ability to think closely or critically about the terms of their present culture and their own intellectual biases and cultural embeddedness. Even some of the more astute students asked questions such as, "Isn't this art important because it led to . . . .," as though the process of cultural representation were a singularly linear one by which an event naturally and predictably led to a second and a third like dominoes in a row. Ensconced in their own time, these young scholars are living a "cultural mystique" that works against their development of a general sense of criticality about their environment, leading them to discount the need to distance themselves from the sociocultural events and settings of their existences. We recognized the continuing task presented to us and groaned with the weight of the stone as we played out "Sisyphus revisited." A generational gap together with the necessary lack of *solidly* established teaching models for our representation of these constantly reformulated humanities approaches remains the central difficulty of our project.

Our evaluation processes have lead us to the conclusion that the course was not *too* radical; rather, it was not radical enough. Upon reflection, we recognize we had been lured into a traditional mode of delivering information which could have been disseminated more effectively and efficiently through the inclusion of a collateral text. We have come to the conclusion that we need to expand the amount of foregrounding in the initial sessions, including more specific information about theoretical models through which we teach the course, providing by examples the stances implicit within our interpretive approaches. We need to replace the chronologically linear time frame of the nineteenth century (or any other period we might choose) with one that is more episodic, less survey-like, presenting a model of criticality through the structure of the course itself. The course's form as part of the course's content becomes reinforced for the students.

We want to reiterate that our goal was not necessarily to indoctrinate the students in historical materialism, modern feminism, post-structuralism or so forth. Our goal was to show that models of criticality when applied to cultural objects and texts would yield quite non-traditional, yet meaningful interpretations of those texts. Ultimately, we want to demonstrate for the students that meaning is neither innate in the object, ready-made by the media, nor pronounced by the professorate. We want to share with our students the excitement of current humanities practice, encouraging them toward a more self-aware and fully critical engagement with our past and living culture so full, for us and for them, of danger and of wonder.

*[This approach to Constable was derived directly from J. Barrell, ***The Dark Side of the Landscape: The Rural Poor in English Painting 1730-1840*** (Cambridge, 1980) and A. Bermingham, ***Landscape and Ideology: The English Rustic Tradition, 1740-1860*** (Berkeley, 1986).]

This is a revised version of a paper given at the Eleventh Annual Conference of the Association for Integrative Studies, October 12-14, 1989, Sonoma State University at Rohnert Park, California.

EVALUATION OF INTERDISCIPLINARY HUMANITIES: SAINT ANSELM COLLEGE'S EXPERIENCE

Although questions which ask 'What is your response to this work of art?' are asked, they are not asked frequently..."

Although Saint Anselm College did not substantially change its traditional curriculum in the 1960's because "There was an abiding conviction that the basic studies in the liberal arts/humanities retained a validity and worth which were above substantial questioning" (Saint Anselm College, 1975, p. 13), the interdisciplinary humanities program "Portraits of Greatness" was established in place of some of the traditional core curriculum. This change was founded upon the belief that there was an alternative way of teaching the traditional disciplines of history, philosophy, theology, literature and the arts which would not only allow for the experience of interdisciplinarity and an end to overlapping but would illustrate values concretely by organizing the program around significant types and individuals. This was done in the belief "that historical, literary and philosophical personages (and types) are the results of a complex web of interdependencies and that they and the societies in which they functioned cannot be understood except through a knowledge of their interrelationships" (SAC, p. 32). From the very beginning it was intended that "the course should require that students reflect on the meaning and values inherent in the materials studied" (SAC, p. 43). It was further agreed that "humanistic education should . . . nurture the formation of consciously embraced value systems--both cognitive and moral, aesthetic and religious" (SAC, p. 45).

How then to measure the Interdisciplinary (IDS) content and methodology? What elements do we look for? The first and perhaps the most important concept to be aware of is ambiguity. To the degree that questions are sought of students, there is the implicit suggestion that there is some degree of uncertainty present in the work which is under study, since one does not ordinarily ask questions unless there are areas which need definition or clarification.

The second aspect one might search for is evidence of systematic questioning. This does not mean that a decision has been made relative to the specific kinds of questions which are to be asked. As Booth (1979) puts it, it is a question "... of deciding what kinds of questions

1411

we can ask in the hope of obtaining warranted answers" (p. 141). It is not a question of having a list of right and wrong questions, but rather that the inquiry be systematic. For Schmidt (1979, p. 2) this systematic approach to a work of art would involve the ability of the responder to comprehend the range of possible meanings that can be attributed to ambiguity in a work of Art. The student needs to be introduced to this range of possible questions and Schmidt's Modes of Inquiry into the Arts (MIA) taxonomy (see appendix) includes all possible approaches, opening up to the student who has interacted with the work, a full range of questions which might be used in resolving ambiguities.

A final way of measuring interdisciplinarity is in terms of response. Schmidt (1979, p. 2) in describing the skills needed for the development of critical flexibility deals with several types of responses. The first and second skilled response needed are the ability to recognize ambiguity and a range of possible interpretations. Third and equally important is the ability to communicate such skilled responses. Particular emphasis on the *individual responder* is seen in the content category of MIA identified a "I-Responder" which involves statements or questions about the unique experiences, beliefs, attitudes, or values of the individual responder to the work of art. This category is particularly important if one believes that Susan Langer (1953) was correct in identifying the emotions as the source of initial response to a work of art.

Booth and Schmidt provide us with a philosophy and methodology with which to examine and evaluate the interdisciplinary content of a humanities program. It was in the belief that the Saint Anselm materials provided a broad enough opportunity for the incorporation of the ideas of Booth and Schmidt that I set about to do the research involved in my thesis (Valley, 1985)

I thus proceeded to describe what was observed in the process of attending some sixteen lectures and seven sections of seminar which followed each of the lectures. This descriptive analysis was made in order to provide a basis for determining the congruence between the IDS philosophy of the Saint Anselm program and the actual practices of its faculty and students. In addition this data was used to establish the extent to which the various process and content categories are employed in aesthetical and critical discourse, and thus the degree of critical flexibility, as understood by Schmidt and of pluralism, as defined by Booth.

Each lecture and seminar was examined from the following perspectives:

1. How many contents (subjects) are discussed? These are identified as content categories. (see appendix for definition of terms)

2. How many open-ended questions or topics are employed? When? How?

3. How many processes (organized systems for considering a subject) are used and under what conditions?

4. How many perceptive as opposed to interpretive questions or statements are used?

5. What is the focus (primary emphasis) of the inquiry?

Examples of the analysis of lectures in the Thomas Jefferson unit follows:

Lecture 1: "Thomas Jefferson, The Man"

The lecture was a biographical sketch of Jefferson. The majority of the processes used were in the form of philosophical statements about Jefferson's views on government, the relationship between church and state, the question of slavery, and historical, about the man and his times. The historical statements received the far greater emphasis.

Lecture 2: "Jefferson the Philosopher"

Two contents received about equal attention: Jefferson and the literary universe which influenced him. Reality was referred to less frequently within the context of the practical versus the philosophical affairs of nationhood. A large number of philosophical statements were made and questions asked on the nature of government as well as of the person, and the influences of various philosophical schools upon Jefferson's thought. The questions asked throughout the lecture demanded interpretation. These questions concerned Jefferson's ownership of slaves, alternative bases for political power, and the legitimacy of the revolution or its value, since it arose from anarchy.

Lecture 3: "Jefferson the Visionary"

Three areas of content were discussed: by far the most frequently, the ideas of the author not identified by means of specific works; less frequently the real world that has resulted from Jefferson's democratic ideals; and lastly the University of Virginia, as a specific work which mirrored his ideas.

The only open-ended process and content question contained in the lecture was one which asked "Why do we still invoke the memory of Thomas Jefferson?" Specific processes used were primarily interpretive philosophical statements about the author's ideas. The focus of the inquiry was on the philosophical analysis and evaluation of Jefferson's ideas and their relationship to the reality of twentieth century America.

Lecture 4: "Thomas Jefferson, Architect"

The contents covered by this lecture were equally divided between the artist, the artistic universe in which he was educated, and the specific works of architecture for which he was responsible.

The processes used most frequently and about equally were the formal and philosophical as individual buildings were formally examined as to their design and their significance as reflections of Jefferson's philosophical thought. Since this lecture was some-

1413

what biographical all of this took place within a historical account of his education in architecture and the design of the buildings to which he was introduced.

The statements made about the meaning of the buildings were highly interpretive, and such statements were in the majority. The focus of the inquiry was the philosophical aspects of Jefferson's thoughts as evidence in his buildings.

Seminar 2 Selected Writings of Thomas Jefferson

Historian: Although the inquiry was primarily an extension of the philosophical and historical categories and dealt with reality as perceived by the students and seminar leader, much of it was original, as were the questions about the relationship between happiness and material goods, whether Jefferson can be considered a spokesman for today, and the validity of the American Revolution.

Theologian: The major topic of discussion was the question "Is there a universally valid set of prescriptions which reason can discern and which should govern human behavior?" This is an open-ended process and content question. Students argued from the psychological and socio-cultural perspectives about the validity of this statement. The interpretive mode was used for the most part to address this question as the subject of meaning and reality were discussed.

Spanish teacher: The philosophical process was primary with the historical supporting it. Interpretive questions were predominant focusing on the role of government in fostering virtue, freedom of choice, the reality of the problem of church and state, and honesty in government. The question of the role of government in fostering virtue introduced a new area of inquiry.

Art Historian: The opening question was open-ended in process and asked "What does Jefferson's thought have to say to us today?" Philosophical statements were made about happiness as a goal of government, socio-cultural statements were made about leniency toward the criminal in our society, and psychological statements about the negative attitude of the young toward government. Interpretation was heavily in evidence as the students attempted to cope with the idea of "what is happiness"?

SUMMARY

Ambiguity is not celebrated in the Saint Anselm Program, nor were the students generally encouraged to search for it. On the other hand, there is no evidence that the students were encouraged to believe that there was only one way to look at a work of art, or that there was only one interpretation to be made thereof.

The data indicates that questions and statements asked in lecture will be used for the most part in subsequent seminars. To the degree that such questions provide for systematic study of a work of art, systematic questioning will occur. There is not, however, systematic questioning of the same type taking place in all lectures and seminars. For example, the I-Response category and reality are not necessarily discussed in every seminar, nor is such a response invited in every lecture.

The Saint Anselm Program, since it uses the seminar mode as a major teaching method, does elicit responses from the students. Frequently these responses are of a type that may be called "information retrieval". This results from questions which ask for a reiteration of information given in the lecture or in the seminar reading. Although questions which ask "What is your response to this work of art?" are asked, they are not asked frequently, nor are students frequently challenged about their response, and no attempt is made to make the students aware of the category they are using nor of why they are using it. For example, the seminar leader does not say, what is there in your background that gives rise to that response? Thus the category I-Response is used less frequently than might be expected.

To the degree that the seminar leaders and lecturers use a variety of modes in their approach to the Arts, they serve as models to the students, but since they never explain what they are doing in terms of methodology they may serve as unrecognized models.

The question might be asked whether the program is as interdisciplinary as it might be if the faculty were more aware of what they were doing, aware of additional modes of inquiry that might be used and more prone to inform the students of what they are doing when they employ various modes. A number of the lectures could be far more interdisciplinary than they are, and greater use of open-ended questions in the lectures could lead to seminars which are more interdisciplinary.

It is hoped that this example of the utilization of MIA as applied to the evaluation of the Saint Anselm humanities program will be of assistance to those who are searching for a method of evaluation but also that it can be seen that MIA is a useful tool for teaching interdisciplinary program.

APPENDIX

The Process categories on the chart utilized in Mode of Inquiry Into the Arts are the following:

The Formal: referring to questions raised or statements made about a work of art by a responder by which he/she attempts to resolve or discuss ambiguities or complexities by referring to the nature and relations of its part.

Linguistic-semantic: referring to structural, etymological, or symbolic constructs of language.

Historical: referring to the unique conditions of time, place, and historical constructs.

Mathematical: referring to concepts of quantification and of symbolic language systems.

Philosophical: referring to theories and constructs related to connotations, feelings, and personality.

Scientific: referring to concepts from the natural sciences.

Socio-Cultural: referring to cultures and sub-cultures.

Technical: referring to techniques and materials.

The Content Categories utilized by MIA are the following:

The Specific Work: Questions raised or statements made about the work of art under study or examination.

I-Responder: about the unique experiences, beliefs, attitudes, or values of the individual responder to the work of art.

Audience: about the responders or potential responders as a collective group.

Fictive Universe in the Work: about the society contained in the work of art.

Literary/Artistic Universe of the Work: about the literary/artistic world of which the work is a part.

1417

Author/Artist/Composer: about the creator of the work of art.

Myth: about the narrative archetype which is outside the work but which structures it.

Performance: about the reading of, acting out, or presenting of the work of art.

Reality: about whatever the responder conceives as being the real world.

Meaning: about the meaning of the work itself.

Intention: about the author's intention.

Statements or Question Types:

Open-ended: Questions or statements which do not point directly to any process, and/or, content category which is to be used in answering the questions or statements.

Perceptive: Questions or statements which ask for or result in a response which reports solely on the content of a work of art.

Interpretive: Questions or statements which ask for or result in a response which interprets the meaning or significance of a work of art.

"The discussions we engaged in often gave me chills because there was so much honesty and openness." --Wendy, a sophomore

History

Let me begin by giving a brief history of our Humanities program at Marymount. Like most small, liberal arts colleges, Marymount had a highly structured "top-down" curriculum in the 50s. In the 60s and 70s that evolved into an unstructured "open" curriculum. As a result, the distribution requirements were so loose and the major requirements so abundant that, to quote our dean at the time, "students in one major were unable to communicate with the majority of students in other majors." To ensure that students had a common learning experience and a strong liberal arts background, the faculty and administration began planning a core curriculum in 1979. In 1982, when we had almost finished the project, we applied to Project Lodestar (an AAC funding source for consultants) for assistance in sounding out our ideas and fine-tuning our plans. As a result of the grant and outside consultation, the General Education Committee (GEC) which consisted of faculty, administrators and students, devised a more structured general education curriculum proposal that was approved by the faculty and was begun in 1983.

The new curriculum includes three three-credit core courses: "The Ancient and Medieval Worlds," "The Renaissance Through the French Revolution," and "The Modern World," (19th and 20th Centuries). These courses are for freshman and sophomores and must be taken in sequence; they are interdisciplinary and incorporate women's (Marymount College Tarrytown is a women's college) and non-western civilization studies. The courses are also organized around a cluster of five thematic concerns: 1) Life as a Journey, 2) The Individual vs. Society, 3) Changing concepts of Freedom, 4) Human Suffering, and 5) Roles of Gender.

Personal History

My own history in this project is that of the typical academic who likes to stay in his own discipline and not get too involved in academic politics. However, I was asked to serve on the Lodestar team and once the proposal passed and was implemented in 1983 I went back to teaching my psychology courses. I never dreamt that I would become part of the Humanities program. However, somewhere along the way I was approached by our new dean about the possibility of teaching in the humanities program. She used flattery and said that the program was "selective" and she thought I would enjoy teaching humanities courses. Besides, she happened to know that my undergraduate major was philosophy since I was studying for the priesthood at the time. However, that all seemed back in the stone ages and I declined. *until* one of my senior colleagues in the department began teaching in the program in 1987-88 and raved about its being one of the most exciting things he had done in decades. That turned my head and I decided to enroll in two of the faculty development seminars for humanities faculty which were designed around the five themes (specially the first two: Life as a Journey, and The Individual vs. Society) of the program. I am embarrassed to say that I was reading some of the world's great literature for the first time in my life: *Antigone, Don Quixote, Hamlet,* and *Moby Dick*, etc. Needless to say, I was hooked and I taught my first humanities course, "The Modern World," last spring (1989).

Let me tell you that it was one of the best experiences I have ever had teaching. First of all, I was not an expert and very much the student (I like to think "master student") among my students. Secondly, it gave me a chance to experiment with some of the ideas that I have begun to develop in my other courses but didn't feel quite as constrained by content, perhaps because I was an outsider and did not have any vested interest in any of the readings. (My humanities colleagues are endlessly fighting over what should and should not be included in the reading list.)

The first most important influence in my approach to the course came with the fortuitous discovery of Andrew Flaxman's seminar, "Educate Yourself For Tomorrow". Flaxman's seminar is a Great Books kind of course that caught my eye in the brochure of Wainwright House, and adult educational and conference center in Rye, NY that has a special focus on interdisciplinary programming. If I may quote from Flaxman's description: "Educate Yourself for Tomorrow helps busy adults develop a broader and more mature depth of cultural knowledge. The seminar program uses concise, interpretive guides for each discussion. The approach is very different from that taken by colleges and universities. Whereas the normal course of study is to try to understand Plato, for example, the method used in this program is to study yourself by using the *Dialogues* to facilitate the process of self-knowledge. *Self-knowledge is the goal: Plato is the guide* (emphasis mine)."

Unfortunately, Flaxman has not written about his unique approach to the study of the humanities* but there is a book that I discovered subsequently, one that I know Flaxman would agree with and I want to bring it to your attention. It is titled *Reclaiming the Humanities: The Roots of Self-Knowledge in the Greek and Biblical Worlds*. In the first chapter of their book, Simone and Sugarman (1986) remind us: "the word humanities is derived from the Latin *humanitas*, which means in its broad sense the study of human nature. According to one ancient source, the word *humanitas* is a Latin translation of the Greek word, *paideia*. In ancient Greece, *paideia* was the process of the general and liberal education used in preparing a person for adulthood and for civic freedom and responsibility. Thus, the origin of the idea of the humanities is connected with a broad kind of study that both introduces a students to culture in general and to the student's own growing competence as an autonomous individual within that culture. (p. 1-2)."

To quote Simone and Sugarman further, "The process of education is from its root an odyssey of discovery, a journey to find ourselves through the paths that have been united in us and our world... Our own search for self-understanding is a collective as well as personal pursuit. Necessarily, then, such an odyssey must retrace the turns by which we, as the subjects of our own enquiry, have been thrust into the contemporary world through ancient adventures. Our goal is not to engage in antiquarian history, for to do so, we should remain one with the artifacts unearthed. Rather, our true task is to make those ancient odysseys live again, and thereby to install the past in the present. To do so will make us contemporary with our own collective beginnings, and consequently throw a light ahead of ourselves where future, past and present are stilled long enough to let us think along with our teacher, the texts themselves (p. 5-6)."

"Our approach to the reading of the seminal texts of the West involves an attempt to understand these works accurately in their own context, but even more crucial is our desire *to encounter these works as contemporary with ourselves and formative of our world* (emphasis mine). It is in this sense that we take up Nietzshe's challenge, presented in the opening of *The Genealogy of Morals*, that our first obligation to inquiry is that we knowers become known to ourselves (p. 209)."

THE METHODOLOGY

Two of the unique features of the course were: 1) each student took turns leading one of the classes; and, 2) each student kept a journal in which they were encouraged to reflect on the readings and see how they might help them understand the dynamics of their own life. In other words, the students were encouraged to "encounter these works as contemporary with (them)selves."

With regard to the students' leading the discussions, I can tell you that it was a big success. I must confess to being worried that it might be perceived as dereliction of duty. However, the response could not have been more enthusiastic. First of all, it set the stage for what Belenky *et al.* (1986) are calling "connected teaching" or "academic midwifery" in their book, *Women's Ways of Knowing*. For those of you who haven't yet read their book, and I strongly recommend that you do, "connected teaching" is contrasted with what Friere calls "banking," i.e., filling students by making deposits of information which the teacher considers to constitute true knowledge. The "connected class" provides a culture for growth - as Elbow says a "yoghurt" class as opposed to a "movie" class.

In fact, one of the students from this class recently composed a letter to the

Humanities Faculty criticizing aspects of the Humanities Program that included the following: "The method of teaching employed by most professors is detrimental to our learning capability. A dominant professor lecturing to a subordinate class is not beneficial and is a distinctly nonfeminist feature. This is quite a hypocritical situation for a women's college that claims to aid women in acquiring a voice. Our suggestions for improving the course are as follows:

1. Have professors sit side-by-side with the students in a circle.
2. Have class discussions led by students."

(There were other suggestions as well such as including more works by women authors.)

Secondly, I can happily report that the students rose to the occasion. They prepared quite diligently by doing outside reading and really became expert on the assigned reading, to the extent of which they were capable. I would meet with them prior to the class which they were to lead and much of the time was spent in assuring them they were fully prepared and that they could do it. Their performance in leading a discussion was graded and I did not give a grade lower than B.

Thirdly, in the teacher-course evaluations of the course at the end of the term, the students reported that this was one of the most important features of the course that they liked. Far from feeling that it allowed the professor to shirk his responsibility, the vast majority of the students indicated that it allowed them to take more responsibility for the course and contributed to a feeling of pride and accomplishment. Having only done this before with students in a senior or honors seminar, I was truly impressed with their performances as well as their own response to the challenge. It could not have worked out better.

With regard to the keeping of a journal: First of all, a hand-out on journal-keeping from McCarroll's (1976) book, *Exploring the Inner World*, was very helpful in setting the stage for keeping the journal. I have used this hand-out before and it has always been successful. The concluding paragraph gives a sense of McCarroll's unique approach to journal-keeping: "Each of us is a necessary part of a long story. It would have been nice if we had been taught our place in the story when we were young children, but a while back it seems as if every one forgot the story. So we all grew up wondering about our value and our worth. We search for a place where we can belong. Now when we are older and it is harder, we must learn that our value is in being who we are and that we belong here. *It is through my journal that I begin to hear my own story and to search for my part in the history of life* (emphasis mine)."

Rather than my telling you how the students responded to the keeping of a journal, let me quote from one of the student's final self-evaluations: "My journal reintroduced me to myself, a part of me that was lost in lectures, studying, and writing papers. I've learned that it is important to take the time to be by myself. A time to be free, a time to dream and a time to write. I've always tried to keep a journal, but with my busy schedule I forget to write for weeks at a time. I want to start over again with a new journal and my new attitude. I feel happier about myself and my relationships as a result of taking time to write my thoughts out. I've learned a great deal from this class, but most importantly, I've learned a lot about myself."

Results

And what about results you may be asking? Before answering I must confess that I have been very much influenced by Sharon Parks' (1986) book, *The Critical Years*, on faith development in young adults in which she says that "every professor is potentially a spiritual guide and every syllabus a confession of faith." This is the only book I know of that focuses on faith development in college-age students and their search for meaning and maturity of commitment and life, calling higher education to its true vocation as "nurturer of meaning."

In answer to the question about results, I have decided to let one of the student's self-evaluations speak for the class. In honesty, the student is more articulate than most, but I do not think atypical, in so far as what the course meant for her. I beg your indulgence while I quote from a sophomore's paper whose first name is Wendy, a member of a 12-step program and a recovering alcoholic and drug addict: "Humanities 103 has truly helped me to grow. Just about all the books that we read enabled me to take a closer look at what is really important to me. Throughout the semester attending class was truly a pleasure. The discussions we engaged in often gave me chills because there was so much honesty and openness. It seemed as though I was sparked with an awareness during every class period. The books that opened my mind up the most were *The Woman in the Dunes*, "Bartleby, the Scrivener," and *A Room of One's Own* (Cf. reading list). Although these books certainly contributed to my self-exploration, it was the classroom discussions that interpreted what it was that these famous writers were attempting to display, and that illustrates to me that real learning took place."

"...All of the humanities courses offered me a great deal. It seemed as though they were all arranged in an order that aided my self awareness. *Each class helped me wake up a little bit more* (emphasis mine). The final required humanities class in now ending, and I have to say that I'm grateful I was pushed to read these classics, because I think I'm a better person for reading them. I now believe the more one tries to discover herself, the better she becomes, and therefore the better the whole world becomes. People who are aware and in touch with the kind of issues we discussed in class contribute in making up a better world for everyone."

Reflections

As I reflect upon my experience in teaching this course, I ask myself whether my training as a psychologist made any difference in the outcome for the students. This is a hard question to answer because it implies that I can separate that training from the other variables that obviously contributed as well, such as my 25 years of college teaching and my own personal and spiritual development. As an educational psychologist, I suppose I am more student-centered than most of my colleagues, at least by training. Therefore, the way I structure a class (pedagogy) probably reflects my training more than the way I approach my reading of the literature. On the other hand, I don't think I "taught psychology" in this course. For me, Peter Drucker put it well in *Time* magazine (Jan. 22, 1990, 6) recently: "We should know that the old approach to education is theoretical and unsound. We still believe that teaching and learning are two sides of the same coin, but we ought to realize that they are not; one learns a subject, and *one teaches a person* (emphasis mine.)" Something important has begun to happen as I begin to shift my perception of myself away from "professor of psychology" to "teacher of college students." Indeed, the real teachers, to quote Simone and Sugarman one last time, were "the texts themselves."

As to what I got out of teaching this humanities course, I think it helped to renew my appreciation of the power of great literature in the process of personal transformation. As Wendy said in her evaluation: "Each class (book) helped me wake up a little bit more." As a result, this past semester (spring 1990) I included two works of literature (*The Color Purple* and *The Bell Jar*) in my Senior Seminar in Psychology and the student response was very positive. Next semester I am scheduled to teach the humanities course for the second time and I can't wait!

*Editor's note: Andrew Flaxman has now prepared a book on his program, and a chapter will be published in the next issue of *Humanities Education*.

[NOTE: This article is based on a presentation at the annual meeting of The Freshman Year Experience, University of South Carolina, Columbia, S.C., February 1990.]

The Reading List (in order of assigned reading)

Shelley, Mary. *Frankenstein*

Darwin, Charles. *The Origin of Species* (excerpts)

Thoreau, Henry. *Walden* (excerpts) and *Civil Disobedience*

Marx, Karl. *The Communist Manifesto*

Mill, John Stuart. *On Liberty*

Freud Sigmund. *Civilization and its Discontents*

Melville, Herman. "Benito Cereno," "Bartleby, the Scrivener," and two others

Kafka, Franz. *The Trial*

Abe, Kobo. *The Woman in the Dunes*

Woolf, Virginia. *A Room of One's Own*

Annotated Bibliography

Belenky, Mary, *et al.* *Women's Ways of Knowing: The Development of Self, Voice and Mind.* (NY:Basic Books, 1986).

(This book constitutes one of the most important contributions to the understanding of intellectual development of college students, especially women and probably men as well, since the publication of Perry's book in 1970. A must for anyone involved in the education of young women.)

Cheney, Lynne. (Chairman) *50 Hours: A Core Curriculum for College Students.* (Washington, DC:NEH, 1989).

(Must reading for anyone at an institution presently going through the birth pangs of developing or revising a core curriculum for college students. It addresses all of the issues, looks at what everyone is doing or not doing, and ends up with a masterful proposal of "50 hours.")

Flaxman, Andrew. *Educate Yourself For Tomorrow.* (411 West End Avenue #14C, New York, NY, 10024, (212) 724-0984).

(A brilliant seminar program that approaches the humanities by taking some of the great literature, music, art, etc. and using it to facilitate the process of self-knowledge. "Self-knowledge is the goal; Plato is the guide.")

Parks, Sharon. *The Critical Years: The Young Adult Search for a Faith to Live By.* (San Francisco:Harper & Row, 1986.)

(The only book that I know of that focuses on faith development in college-age students and their search for meaning and maturity of commitment and life, calling higher education to its true vocation as nurturer of meaning.)

Simone, R. Thomas, and Richard Sugarman. *Reclaiming The Humanities: The Roots of Self-Knowledge in the Greek and Biblical World.* (Lanham, MD:University Press of America, 1986).

(A contemporary and radically grounded approach to the Humanities calling for a new and authentic encounter with the seminal texts of the Western world and arguing that the crisis of contemporary education is precisely the division between abstract learning and the knowledge that a learner has of his own experience.)

Alan Farrell

"...TO BE HUMAN": A PERSPECTIVE ON CLASSROOM DYNAMICS WITH JOHN RASSIAS

"By the semester's end all save one of the students...had broken down and shed the crust of indifference..."

A Prefatory Word

In 1986 John Rassias, Professor of French at Dartmouth College in Hanover, New Hampshire and the Dana Foundation launched a collaborative project to improve language learning in American higher education. Concentrating on small, independent colleges, they invited language teachers to come to Dartmouth to study, teach, and enjoy the resources--not the least of which turned out to be the students--to appreciate and develop new methods and approaches. The focus of the project was, naturally, the DILM (Dartmouth Intensive Language Model) or Rassias Method, a highly physical and dramatic immersion in all aspects of language learning where the essential elements are peer instruction and fuuuuuuuuuull participation. The author was in the first "class" of Dana Fellows; he attended classes at all levels as a student, taught under supervision of Dartmouth Master Teachers, conducted research both pedagogical and literary, conducted experiments with state-of-the art computers furnished by IBM, and attended seminar meetings with guest speakers from all over the nation representing a wide range of language philosophies. Though the entire experience was marvelous and marvelously diverse as one might imagine, the author's fondest recollections remain those taken from the classes themselves, where the Rassias Method, often erroneously associated with its merely visual keys like shirt-tearing, water-sloshing, or egg-tossing, works its real miracle, a "miracle" wrought out of energy, faith, technical virtuosity, and persistence.

The Classroom as Arena

As I sat waiting in Dartmouth 108 for John to arrive that first day, I scanned the theater in which the action I had heard so much about was to develop. This particular stage had nothing spectacular about it. Chairs neatly arrayed, side-by-side and front-to-rear. Individual Hitchcock chairs, by the bye, with the Dartmouth logo duly stenciled

1457

in gold leaf on the back. Staid white walls with high, vaulted windows through which a lugubrious mid-winter light filtered. Black blackboards upon which one would write in white chalk, not the eye-easing green of the brave new world. All in all, a fairly conventional setting for what has been touted as cutting edge pedagogy. I wondered in what way any kind of technique or method could transform these dignified but prosaic surroundings into the much-vaunted magic of DILM.

One thing did strike me, though. The students spoke with one another in highly animated tones, buzzing with gossip, dire forecasts, anecdotes, tall tales, and conjecture about what was going to happen to them. They assailed one another with accounts of past Rassias apparitions, prior manifestations of his ogre-like genius, studently legends of bouts with the Master. The room vibrated--I can honestly find no better word--vibrated with a pulse, rhythm, and electricity which the spirit Rassias, the disembodied Rassias, the imminent Rassias projected from a hundred meters away in his sanctum. The kids fairly glowed with anticipation, such was the atmosphere of enthusiasm, optimism, dynamism that has come to associate itself with the Rassias technique. They knew first off that this sort of class was unusual, fraught with menace, daunting, unpredictable, physical, and--best of all--that it worked. They chattered about their hopes, their failures, their trepidations; they intoned the long litany of past French courses blown up, blown off, blown out, blown over, in the patois of college kids; they evoked the happy memory of brothers, sisters, roommates who had whispered the secrets of Rassias French to them; they waited for the teacher, positively suspended in a delicious agony.

I was curious, myself, a professional teacher and habitué over long years of such classrooms. I wondered what modifications Professor Rassias would make to the arena when he came. And come he did: roistering, blustering, fussing, and squawking down the hallway, already audible and casting aforehand his shadow upon the class. Hush. He kicks open the door, slings a ratty briefcase to one side of the room, his old coat to the other, knocks over a chair as he lurches for the desk. "No barriers," he howls, in what I learn is a familiar refrain, and sets about driving, heaving, bludgeoning with gnarled fists the wholly disoriented students into a vague semi circle, an amphitheater as I would later discover, with the backboard and desk slightly offcenter at the open end of the horseshoe. The students had strategically chosen their seats, the more gregarious planting themselves in harm's way, up front; the timid and faint of heart lurking in the rear where they could plan, squirm, fret, and dodge the prof. Almost at once their plan dissolves: they are all naked, exposed, out in the open, and vulnerable. They have no time to pick sidekicks, chums, agents in the crowd. "No barriers," roars Rassias, and the students scatter to the winds.

This amphitheater he has constructed, I learn, is not for him. He is not the actor and rarely occupies center stage. He prowls the coulisses, the marge, coaxing, directing, choreographing and eventually delegating even these chores to the students. The stage is for them. It is a stage upon which they will prance, warily at first but with increasing confidence, a confidence which has little enough to do with French, from what I observe. These kids, from flashy prep schools and from the honor rolls of good public schools, proud--arrogant perhaps--come to Dartmouth as to Valhalla: it is for many the end of their struggle since they are already recognized for their virtue, and publicly. They have got into Dartmouth. Others of their friends, many others, have not. But my impression was that for all their achievement, for all their scores and class presidencies and editorships of this and captaincies of that, these kids are quite shy. Much like other nineteen-year-olds, all over the nation entering similar classrooms. Similar but for the Presence commanding, currently destroying this one.

Rassias chooses his symbols with care. He breaks things, he spills things, he tips things over; he upends the upright, uproots the implanted, unearths the long-buried. This classroom is his, every corner and all dimensions of it. He occupies it, in every sense. He flings chalk into its recesses, he caroms off its corners, he fills its vaults with noise, he whirls furniture in a relentless choral dance of chairs and desks and their occupants, who must learn that they have no place in this weird new world unless they can redefine it--in French. "You go over here," he shouts. "You over there." "This is Bourges." "This is a train." No elaborate scripting. No warning. No set up. A snap of those banana fingers, and we are transported. In a real sense he unburdens his students of the weight of order. "A great disorder is an order," says Rassias, echoing Wallace Stevens; "A great order is disorder. The two things are one." Rassias is the Connoisseur of Chaos!

Atonement with Things in a Reified World

This new universe is his. He overturns things to make of them other things. He turns things inside out to make them other things. He tears things apart to make them other things. A constant challenge to even youthful imagination. And a constant supply of it when the students run short. It is a sort of enchantment. "This chair is a house," he howls. "This desk is a boat." "This handkerchief is a flag." "These doughnuts are wheels." "These bits of chalk are teeth." He expropriates the objects in his world for his own purposes.

With his insistence on French only, he has denuded his students and left them unarmed and inarticulate in a wilderness, much like a primitive human being at Nature's dawn. They can only grunt and point. Buuuuuuuuuut... they have, like Nature's aboriginal denizens, their fellows from whom to draw comfort and from whom to exact cooperation and collective resistance against the forces marshaled against them by the malevolent deity: Rassias. In this new and naked state, Rassias reacquaints them with the evolution of Man. First they must inventory their small world. And small it is: no farther than an arm's reach. They learn to identify and account for the things around them and--like the primitive--to see in each thing its metaphoric extension, its uses, its hidden secrets, its forms. "This book is a bird," says a student, flapping its leaves like wings. "This scarf is a fish,"

1459

asserts another, making ichthyoidal swishes of the imaginary tail. They are learning their way out of the concrete, seeing--perhaps for the first time--the real magic of words and the real purposes of human intelligence. They are unlearning a long apprenticeship to the here and now, leaving a thralldom to the commonplace and the too-solid reality of geometry.

The Merging and Emerging of Identity

The natural next step, of course, is to begin the probing of the human elements within this circumscribed world. Any teacher knows that this is a delicate and perilous enterprise: the adolescent psyche, postpubescent identity swells up, looms up in all its ungainly dignity, confusion, and pain. Tampering with the facades and "crusts," as John himself calls them, can be risky business inside a classroom. John says that it must be done for the sake of the subject; simple observation of Rassias classes will, I say, suggest that the discipline is rather the justification for the exploring, awakening, glorifying of young spirits.

Just as no thing is what it is in the Rassias universe, likewise no person is, either. Long before he risks inviting the assertion of the individual persona, Professor Rassias has already begun to reveal the malleability of the personality. To a group of students precariously perched on chairs and desks, desperately forming arches, grimacing gargoyles, and flying buttresses, he announces, "You're a cathedral." And they are. To a young woman bent double with her arms flung back, he says, "You're a mobylette." To a young man on all fours, "You're a poodle." To others: "You're a television." "A tree." "A windshield wiper." At first they self-consciously amble up in front of the class, protecting themselves as best they can: heels together, toes in, hands pudicly shielding themselves, eyes downcast, faces red. Smirking perhaps, sullen, cynical. All the worldly disdain of the kid who has spent a summer, for gosh sakes, in France and who just got out of AP French. In all this Rassias patiently and almost obliviously drones on, like a giant flywheel, maintaining the momentum of activities, disregarding the recalcitrants, overriding their collective inertia with his own massive thrust. I was later to discover that he was not oblivious and that he had in those initial hours marked each sulky balker in his mind, singled out this one or that one for a dose, an irradiation of Rassias rays.

From the mimicry of objects, the students became people: train conductors, welcoming family members, policemen, car drivers, and on and on. But before long, the kids had subtly learned to transcend these characters and lend to each a touch of their own. This exteriorizing of the dormant adolescent John accomplished by frequent recourse to a sort of confessional: he would trot them up one at a time to recite a short biographical model he had contrived, but into which each one would pour the vital statistics of his or her young life. Because, I imagine, of the efforts of the Dartmouth admissions office, the variety in a given class (I followed several) was impressive: Montana, Switzerland, Delaware, California, Burma, New Jersey, Virginia, Texas, Michigan, and on and on. The trick, however, was to cause the same formula to be recited more than once, so that each time the student, inured to the scrutiny of his or her fellows, revealed more and more.

Soon, the students had established identities for one another. They had the Animal, the Slacker, the Prom Queen, She-Who-Wouldn't-Sing, Miss Waxed Apple, Arf, and so on. Rassias himself stayed more or less out of this process, only inviting the knowing and presiding in a sort of avuncular detachment to keep things from getting out of hand. And the kids bore these epithets, well, proudly, each proffering the attributes of his or her station when called upon with increasing gusto. At a certain point the young woman called Wax Apple--for reasons which I cannot now even recall--was lured up front to mime a series of fruits for the class as they recited them: for "orange" she squeezed juice; for "banana" she peeled an imaginary one; for "grape" she plucked one from an airy bunch. But for "apple," she merely pointed to herself! I am Apple, she boasted. And so she was.

The game with identity John played again and again, flinging himself time after time against those accreted layers of resistance to the message of humanity he peddles. Now the students take on the character of great names: one becomes de Gaulle, another Billie Jean King, another Reagan, another Jane Fonda, another Barbara Streisand. Their classmates probe these "new" or "other" identities with fierce glee: "What about your divorce?" "What about your sexuality?" "What about your politics?" Vulnerabilities, weaknesses, passions. Always translated into action. Now students frequently find themselves stood up, given an emotion, a quality, an abstraction to register, but only in mime: fear, hate, honor, worth, justice, cruelty, courage, disdain, pity. The whole flood of restrained humanity bursts forth, and gestures which we had thought relegated only to the theater reappear, deft, serious, sincere. One student throws up his palms in abject "terror," another puffs up his chest in token of imagined "worth," another, tripped by an unseen third party, swats her friend "unjustly," while a last glowers silently, only her eyes expressing the silent "hate" this century had come to know only too well.

So What?

Well, it is unnecessary to say that they do not all respond or do not all respond immediately. But soon it is the whole class against the holdouts. And Rassias the gruff referee, detachedly administering the doses of therapy, constantly providing the opportunities for revealing oneself and embracing the humanity of one's brothers and sisters. By now your classmates have seen you in every possible posture and pose: upside down, howling at the moon, rolling on the floor, shut up under the teacher's desk for fumbling an irregular verb, clutched in a giant panda hug by the Master for a word recalled at the right moment; discomfited, bored, elated, confused, hurt, buoyed, confident, irked, outraged, disgusted. If we do not all love one another yet, we know each other. We tolerate one another, enlightened by the evidence of our own silliness, humiliation, grandeur, and disarray.

By the semester's end all save one of the students in that section had broken down and shed the "crust" of indifference to the simple commerce in sentiment that Rassias insists is the root of all language, verbal and non-verbal. Save one. And she, relentlessly refractory, glowered at her tormentor and at her comrades as the snows at last began to melt on Hanover Common. To her was entrusted the duty of being the "radio" of an imaginary auto piloted by the equally imaginary Dupont family, careening its way into History. But "Radio" wouldn't sing! She refused. Sat there mute, lips pressed together with the conviction of an unrepentant heretic. "Radio" wouldn't sing. In one of the last classes I witnessed, though, as the inevitable "voiture" was assembled of students--wipers, driver, passenger, motor, and so on--"Radio" took her sullen place in the array. But this time her fellows were not buying. "Ra-di-o," they chanted; "Ra-di-o! Ra-di-o! Ra-di-o!" Not a taunt. An invitation. Join us. Come on. The water's fine. And she looked around at them, from face to smiling face. Her eyes were wet. Silence fell. I thought for an instant that the experiment was going to fail in the sort of horrendous tragedy from which a young psyche can never recover. But I was wrong. In the silence, "Radio's" lips parted, and a plaintive little verse spun out, almost at once drowned by the howls of delight from her classmates. They didn't want to hear her sing. They just wanted her with them.

And Rassias had done none of it. He had only set the stage, and by his relentless insistence on the human dimension of language, after all the most intimate expression of a people, had contrived to administer a lesson much greater than French. And in that last stirring--and quite tense--moment, he had trusted to the collective humanity of a whole class of students to retrieve and animate one of their own, rightly assuming that to have drawn her out on his own would have been inconclusive. But to have so constructed his class that humanity was its subject and French its vehicle, I say, is the true brilliance of Rassias French. Watching that spectacle each day, I sweat with the kids, ached for them sometimes, resented with them, howled with them, laughed with them, conceived for them a fondness which in the end had nothing to do with my capacity for love or even emotion but with my recognition of the fire and pain in them and in me that makes us all the most curious of animals and leaves us no choice, after all, but **...to be human.**

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

EVERY THING

Julie Thompson Klein, *Interdisciplinarity: History, Theory, and Practice.* Detroit: Wayne State Press, 1990. 331 p. $34.95. Reviewed by William G. Doty, University of Alabama.

Working at a marvelous oldstyle Chicago hotel suite in February 1990, our Society for Values in Higher Education task force on Interdisciplinary Studies, part of the American Association of Colleges' three-year study of the liberal arts major, recognized that our report needed a brief history of American interdisciplinary studies. Julie Klein sat down before my laptop computer (not a computer system familiar to her) and an hour later had produced an important historical appendix to our report (to be published with several supporting documents, in *Issues in Integrative Studies*). Anyone who knows Dr. Klein will not be surprised; just such at-the-fingertips knowledge is reflected in her new book *Interdisciplinarity*, which must be in every reference room collection, and is important for everyone teaching the humanities.

Klein's 100-page bibliography alone justifies the cost of this volume; her careful, explicit tracking of interdisciplinarity brings its usefulness to the broad context of the history of knowledge. We learn that many colleges simply heaped up faculty from several disciplines in an *additive* manner and called it "interdisciplinary," whereas Klein argues that true interdisciplinarity is marked by an emphasis upon *integrative* processes that have to be carefully planned and supervised, and "the magnitude of achieving synthesis has been underestimated" (p. 116). Anyone who has team-taught knows how everyone suffers when instructors merely pile on data from different disciplinary matrices: likewise interdisciplinary research can accumulate uselessly non-integrated data when there is no rigorous attention to holistic synthesis and interpretation.

The definitional issue is not easily resolved, since the literature about interdisciplinary research (IDR), health care, and interdisciplinary studies (IDS--used here with reference to collegiate instruction) that Klein surveys in this book "is littered with labels and disputes about their appropriateness" (p.55). Klein provides as much clarity and synoptic overview as one might desire, given such undisciplined usage. She discusses and gives examples repeatedly, which help us differentiate across the range of IDS universities, undergraduate programs, core curriculae and clustered courses, and other types. Certainly a broad definition comes to mind, in spite of the fact that the synthesis sought will always by specific to the context, such as the resources of the faculty or the problem of the laboratory team. "Interdisciplinarity is an architectonic, productive process, something constructed rather than given" (p.84).

It does not yet emerge spontaneously, because "interdisciplinarity signifies a new way of knowing [that suggests] a new logic of inquiry and new standards for judging scholarly work" (p.96). As a former president of the Association for Integrative Studies, Klein brings to bear extensive knowledge about IDS, and in this clearly-written book she shares it usefully. She also begins to develop issues in the sociology of knowledge that she will explore in some important forthcoming papers (particularly "Discipline, Text, and Critical Theory" and "Holism, Postmodernism, and Interdisciplinarity"). The question of the site at which knowledge is produced (its topography), the extent to which the whole "text-ualizing" movement has changed our approach to information, and indeed the nature of the disciplines themselves begin to be seen in new ways.

The most comprehensive reason for the development of interdisciplinarity has been "the evolution of knowledge" (p.42), and that evolution often calls into question the disciplinary constraints and boundaries that have had to be overcome repeatedly in order to develop such new approaches as chemotherapy, cellular biology, political behavior, psychogeography, and environmental studies. The academic disciplines begin to come into perspective not so much as the places of consensus and stability, but as the seeding places of contention wherein disputes and gnoseological debates can be collaboratively adjudicated. For once, humanities educators are often able to offer their natural and social sciences colleagues useful assistance--the results of their experiences in practical instances of interdisciplinarity as well as philosophical and theoretical perspectives on the production of knowledge.

NO-THING

The Specter of the Absurd: Sources and Criticisms of Modern Nihilism by Donald A. Crosby (Albany: State University of New York Press, 1988) 456 pp., $19.95 pb, $49.95 hb. Reviewed by Walter B. Gulick, Eastern Montana College.

Donald Crosby, a professor at Colorado State University, begins his book with a story about a freshman student who will be recognizable to many of us who teach philosophy or religious studies. The student failed to turn in a paper on Plato's thought. When asked why, he replied that as a Christian he thought writing about a person who had no knowledge of Christianity was a waste of time. He was especially bothered by Socrates' practice in the dialogues of questioning and criticizing everything in sight. This practice could only raise doubts and leave a person with no convictions. The student knew what he believed, and he was not about to expose his faith to the corrosive action of continual examination, whether modeled by a professor or described in a dialogue.

Usually it would be thought that a student with such a faith would be far distant from the nihilist, who sees no grounds for believing that life is meaningful or valuable. But Crosby persuasively argues that such a student is a victim of a nihilistic mood which permeates society today. "What he took to be a decisive alternative to the absurd outcomes of rational inquiry is not really an alternative at all, but an equally poignant expression and confirmation of the very absurdity he sought to avoid. For why should one 'faith' be chosen rather than another?" (p.3) When the student retreats to a fideistic stance, he confirms the doubt about reason's capacity to arrive at plausible views which is the source of the nihilistic atmosphere characteristic of our time.

The Specter of the Absurd is a survey of the ideological and attitudinal sources of this nihilistic atmosphere in contemporary Western culture. Crosby writes as a philosopher concerned both to ferret out the cultural assumptions leading to nihilistic views and to combat these assumptions argumentatively. Despite his almost exclusive emphasis upon intellectual arguments, Crosby recognizes that visceral feelings, formative social experiences, and the like also contribute to the nihilistic outlook (see pp. 118-119 and p. 365). His special emphasis is on the entrenched religious and philosophical assumptions which support nihilistic conclusions, but it must be emphasized that his approach is broad enough to include such literary figures as Turgenev, Camus, Kundera, Jack London, Tolstoy, Shakespeare, Dostoevsky, Kafka, and John Barth. His discussion also embraces developments in science, politics and art. Here is a very complete and thoughtful rendering of cultural presuppositions underlying nihilistic views.

One of the virtues of Crosby's approach is that he is sensitive to the diversity of the forms of nihilism and the interwinted complexity of the beliefs or views supporting these various forms. He distinguishes political, moral, epistemological, cosmic and existential forms of nihilism, each of which includes a variety of views. He attends most fully to existential nihilism, which he sees as the most basic form, encompassing the whole of human existence. Existential nihilism denies that human life is meaningful (p.36).

Crosby believes that different forms of objectivism and foundationalism--whether religious or philosophical in nature--are especially potent forces in contributing to the spread of nihilism. The fading of the classic Christian worldview in Western culture has been claimed by many to have led to nihilism, but Crosby, while agreeing in general with his claim, also points out that six assumptions associated with traditional Western thought have indirectly provided grounds for nihilistic views. The first assumption is (to put the claim all too briefly) that either the God of salvation and redemption rules or we are adrift in a meaningless universe. Second, it is assumed that nature can only have value as the product of deliberate purpose--as conferred upon it. A third assumption is that our deepest religious aspirations can only be satisfied by theism. Fourth, religion is assumed to be intelligible only insofar as it provides a God's-eye (and therefore external) view of the world. "The fifth religiously influenced assumption is that claims to knowledge, to be confirmed as knowledge, must either be known with noninferential certainty to be true, or must be justified as true by being derived or derivable from a foundation of clear and exact propositions that are infallibly or certainly true" (p. 149). The sixth assumption is that the afterlife is superior to this unsatisfying world. These assumptions give rise to nihilistic views if their truthfulness comes to be doubted. But as belief in theism, foundationalism, and eschatology have come to be questioned in our time, so meaningless and unattractive alternatives have gained power. No wonder the student did not want to engage in the questioning Plato encourages.

The thought of Descartes, the source of much modern Western culture, is also seen by Crosby as the fount of many assumptions supportive of nihilism. The emphasis on finding truth through scientific method, the acceptance of a correspondence view of truth, the separation of mind from matter, the reliance upon univocal statement and deductive proof, the belief that one must begin philosophizing from the self or consciousness--such are typical Cartesian assumptions which tend to sunder objectivity from subjectivity and fact from value. Science is thereby rendered "remote from our most distinctive human interests, endeavors, and concerns" (p. 239). Crosby is hardly unique in this sort of critique; indeed, trashing Descartes has become almost expected in twentieth-century philosophy. But he is helpful in showing how Cartesian assumptions support a climate of nihilism.

Crosby convincingly critiques the individualism underlying the philosophy of bourgeois liberalism. Social and political institutions are seen as amalgamations of individuals on this view, and their existence needs to be explained via a social contract view or an instrumentalist interpretation. That is, the state and other institutions are not seen as valuable in their own right, but as designed to satisfy the needs of individuals. Crosby opts instead to emphasize that persons are inherently social in nature. People derive meaning from their interaction within social settings, but these sources of meaning are undermined within that tradition of liberalism within which individual sovereignty and freedom from obligations are emphasized as ultimate. Crosby's critique overlaps that offered by Bellah and his colleagues in *Habits of the Heart*, to which Crosby refers appreciatively.

In his concluding chapter, Crosby considers the debilitating effect that current views of death and suffering have on those seeking meaningful existence. While he offers no startling new perspectives on these issues, he does persuasively show that "the facts of suffering and death, pervasive and deeply troubling though they be, need not finally bring us to a nihilistic conclusion" (p. 353). That is, Crosby offers a sort of secular theodicy in which he justifies the possibility of living meaningfully despite the existence of suffering and death. Inexplicable suffering and unwarranted death do occur; there are elements of absurdity in existence. Crosby suggests that Christianity, when it insists on an ultimate triumph over evil through the cross, postulates an optimism that is so one-sided that it can prevent believers from confronting the ambiguity of reality. It underwrites a yearning to escape the limiting conditions of earthly existence, but it thereby tempts us to reject that which is good and satisfying in daily life.

> The "curse" of this response of ingratitude and pride is perhaps not death itself, as is the more customary reading of Genesis 3:19, but rather an overweening anxiety about death, and unwillingness to come to terms with its necessary inclusion in limited, interdependent existence. Nihilism is symptomatic of this hubris in its unqualified rejection of the gift of a bounded life, based on the assumption that life cannot be meaningful unless it is everlasting. But the assumption itself seems absurd, as irrational as a child's stubborn refusal of a father's invitation to go to the circus simply because the child knows that it will last only for an evening and thus that its delights will not be experienced forever. (p. 360)

Donald Crosby has written a most useful book. He examines nihilism in an even-handed way, for he shows that nihilism contains important truths about existence as human beings. Life is uncertain and infinite. But there is no need to wallow in despair, for even if our limited perspective on things prevents us from proclaiming *the* meaning of life, meaningful existence can be experienced even if not guaranteed. Crosby is primarily content to lay out the problematic assumptions contributing to nihilistic views; he does not say much about the nature and dynamics of meaningful living. But his analytical skill is first rate and his exposition clear. *The Spector of the Absurd* in effect demystifies portentous talk about the absurdity of life. In an age of soaring suicide rates, it is a valuable source of cultural wisdom that deserves wide circulation. Crosby succeeds in showing how a life spent in critical reflection and questioning can be meaningful--he answers the freshman's unspoken anxieties about rationality and the examined life.

BEYOND THINGS

Charles H. Lippy and Peter W. Williams, eds., *Encyclopedia of the American Religious Experience: Studies of Traditions and Movements*. 3 vols., New York: Charles Scribner's Sons, 1987. Pp. xvi + 1872. $225.00. Reviewed by Edward Tabor Linenthal, University of Wisconsin-Oshkosh.

The editors have created an encyclopedia that departs from standard form, for it consists of a series of essays that explore the rich diversity of the American religious experience. The editors cast a wide net in their search for religion in America, and the result is one hundred five essays (the longest being twenty-seven pages and the shortest seven) that vividly describe the intricate and enduring interplay between religion and American culture.

Lippy and Williams have organized the essays into nine parts. Part one, "Approaches to Religion in America," examines how historians, sociologists, psychologists, and theologians have traditionally dealt with their subject. Like the great majority of the essays in the encyclopedia, these are state-of-the art. Interestingly, this section also includes Edwin Gaustad's "Geography and Demography of American Religion," and Donald E. Bryne, Jr.'s "Folklore and the Study of American Religion." Unlike the standard encyclopedia entry, whose only goal is to convey information, essays in these volumes often point out neglected areas in the study of American religion. Bryne argues, for example, after carefully defining "folklore" and "folk religion," that the study of various elements of folk religion (such as speech, festival, stories, and music) reveals a rich substratum of religious data that is often overlooked in judgements of what "counts" as religion in America. He then offers valuable suggestions which students of folk religion could turn into fruitful research.

Several of the essays in Part Two, "North America: Contexts and Backgrounds," cast a glance at religion traditions beyond the boundaries of the United States. Consequently, readers will find articles on "Religions of Mesoamerica," "Religion in the Spanish Empire," "The African Heritage in Caribbean and North American Religions," and two articles on Canadian religion. There are also strong essays on Native American religion and French Catholicism in America. Part Three offers twenty-three articles on "Jewish and Christian Traditions," including Albert Raboteau's essay on "Black Christianity in North America," and Jan Shipps's essay on "The Latter-Day Saints." Part Four, "Religions Outside the Jewish and Christian Traditions," offers excellent essays not only on Buddhism, Hinduism, Chinese religion, and Islam in America, but careful description by Martin Marty of "Free Thought and Ethical Movements," Thomas Robbins's and Dick Anthony's essay on "'Cults' in the Late Twentieth Century," and Lawrence Mamiya's and C. Eric Lincoln's essay on "Black Militant and Separatist Movements."

The editors do not simply focus on diverse traditions, for Parts Five and Six, "Movements in American Religion," and "American Religious Thought and Literature" examine intellectual and social currents that are such an important part of the story of American religion. Except for Stephen Gottschalk's "Christian Science and Harmonialism," the essays in Part Five focus on public Protestantism: for example, "The Great Awakening," "Revivalism," "Social Christianity," and "Pentacostalism." For anyone who wants to understand the historical roots of the chasm between religious liberals and religious conservatives in contemporary American culture, George Marsden's "Fundamentalism," and Charles Lippy's "Millennialism and Adventism," read in conjunction with other essays in this section, are invaluable. Part Six offers essays on a wide range of topics: for example, the evolution of American Catholic and Jewish thought, and the impact of various intellectual fashions: Puritanism, the Enlightenment, Liberalism, and Neo-Orthodoxy. Of particular interest are Mark Noll's "The Bible in American Culture," and Robert Sayre's "Religious Autobiography."

The last three sections of the encyclopedia, "Liturgy, Worship, and the Arts," "Religion and the Political and Social Orders," and "The Dissemination of American Religion," again point out the diversity of subjects the editors have considered appropriate, from essays on religious music and religious architecture to discussions of the history of social reform and civil religion, to essays on the religious press and mass communications. Interestingly, Part Eight, "Religion and the Political and Social Orders" also includes separate essays on "The South," and "California and the Southwest." Sam Hill argues in his essay that "the religion of the southern region is distinctive, owing to the special nature of regional culture and, in line with that fact, its singular religious history" (p. 1493), and Sandra Sizer Frankiel remarks that the "religious culture of California and the Southwest...represents a diverse yet regionally distinctive development in American religion" (p. 1509).

Certainly one of the major challenges in the creation of such a set of commissioned essays is the organization of material. And here, everyone will have their own minor quibbles. Why, for example, is an essay on the "Roman Catholic Heritage" placed in Part Two, "North America: Contexts and Backgrounds," while essays on Lutheran, Calvinist, and Wesleyan Heritages appear in Part Three, "Jewish and Christian Traditions?" And why are essays on "The Anglican Tradition and the Episcopal Church," and "Christian Theological Education" the lengthiest in the entire encyclopedia? While worthy of inclusion, these certainly do not deserve the most space in such a wide-ranging reference work. There are also several articles--notably those on "Material Culture and the Visual Arts" and "War and Peace"--that could have been more imaginative, and an occasional graph or map would have been useful. These minor criticisms notwithstanding, Lippy and Williams, and their authors, have provided students of American religion and culture a reference work of enduring value.

CHEK LIST

Eekman, Thomas A. (Editor). *Critical Essays on Anton Chekhov*. Boston:G.K. Hall, 1989. 208 pg. $38.50. Reviewed by Roger Johnson, Jr., University of Southern Mississippi.

Eric Bentley once wondered "how Anglo-American theater finds it possible to get along without the services of most of the best playwrights . . . Aeschylus, Lope de Vega, Racine, Molière, Schiller, Strindberg"; but has preserved Chekhov "from oblivion" (169). His answer is to be found in the well known essay, "Craftsmanship in Uncle Vanya," reprinted in the present volume. One might also ask how it is that yet another set of essays on Chekhov can find its niche on a library shelf already rich in collected essays (e.g. Rene Wellek's and Nonna D. Wellek's *Chekhov: New Perspectives*, 1984). And yet there is much here of value, and some of it would otherwise not be available to those of us who unfortunately can read (and teach) Chekhov only in translation.

The book contains eighteen essays, a selected bibliography, and an index. Six essays comprise the first section, "On the Prose." They range form Leo Shestor's 1916 commentary (reprinted from a 1966 translation), through essays and excerpts by Conrad Aiken (1921) and Vladimir Nabokov (1940), to a 1984 essay by George P. Elliot. Eekman remarks that the span will illustrate changing attitudes toward Chekhov, an interesting topic left very sketchy indeed in the introduction. A section entitled "On Specific Stories" includes five essays, and "On the Plays" contains seven more.

David Woodruff translated two essays specifically for the collection: Vladimir Kataev's "On the Nature of the Comic in Chekhov" (1971) and Zinovii Paperny's "Microsubjects in The Seagull" (1982). Both are splendid, and readers will appreciate Woodruff's clear prose. To my mind, the latter essay is the most valuable item in the collection. Paperny likens the study of Chekhov's text to the investigation of matter, "where researchers have come to employ smaller and smaller units of magnitude" (160). Microsubjects are, in part, various subjects for literary work suggested or projected by characters in the play. The argument is convincing and illuminating: microsubjects are "like little periscopes that connect what is happening on the surface with the very depths" (162).

Among other essays useful for the student of Chekhov should be mentioned John Freedman's "Narrative Technique and the Art of Story-telling in Anton Chekhov's 'Little Trilogy'" and Phillip Duncan's "Chekhov's 'An Attack of Nerves' as 'Experimental' Narrative." Eekman's inclusion of the latter, however, brings up a minor problem in selection. Duncan's essay was anthologized twelve years previously; Bentley's essay appeared a scant five years previously in a widely accessible collection. There is perhaps reason to reprint these essays because of their quality, but one cannot help but wonder whether these and a few other duplicative essays might have displaced valuable material in Russian not otherwise readily available. I question, also, the inclusion of Eekman's own "Anton Chekhov and His Play without a Title," translated by the author from the 1954 French original. It does not seem to reflect Eekman's more mature perspective, and the notes and scholarship are dated despite the author's sparse additions.

Despite my quibbles, the new collection will find its niche on the shelf, and students of Chekhov will find it helpful. Teachers of world literature in translation will especially welcome the new material.

REMINDERS TO NAHE MEMBERS

When you renew your membership, please note that the annual rate for four issues has been $20 since January 1990.

Mark your calendar for NAHE's biennial convention in Lafayette, Louisiana, April 19-21, 1991. It promises to be an exciting program.

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity, humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have word-processed your article, please specify the program you used (we use WordPerfect). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

COMPUTING AND THE HUMANITIES: THREE PERSPECTIVES

Introduction by Charles Ess

The following essays represent three perspectives on a common concern—the role and impact of computer technologies in the humanities and humanities education. The first, by Phil Mullins, examines in depth and with some optimism the potentials of electronic media, especially hypertext, for communication—along with the ways in which the new media may "reshape our practice and understanding of reading and writing." The second, by Charles Ess, is an interim report on how incorporating hypermedia and telecommunications has in fact affected his teaching and the learning experience of his students. The last, by Walter Gulick, is both humorous and sober in its "curmudgeonly" reservations about the possible impacts of computer technology on the traditional goals and values of the humanities. Three philosophers, then, reporting on three different dimensions of the complex intersection of computers, humanities, and education. While we each take different views—we clearly agree: as the computer continues to reshape, sometimes in dramatic and revolutionary ways, the fabric of our disciplines and our lives—those of us who are committed to education in the humanities must carefully consider the many ways in which the new technologies may both enhance and distort our disciplines and our teaching.

These papers are based on a panel discussion presented on April 22, 1989, as part of the NAHE biennial meeting in Kansas City, MO.

NEW IMAGES OF TEXT, TEXT-MAKING AND TEXT-READING

> The handwritten papyrus roll, the codex, and the printed book (as well as clay, stone, wax or wooden tablets) have each imposed limitations and suggested possibilities to their users. Spoken language, which antedates all of these, too has had limitations and possibilities. Genres of literature and indeed a culture's whole outlook are profoundly affected by the media of the age. A nineteenth century novel is obviously unthinkable for a culture that carves its inscriptions on stone or wood and composing a new Homeric epic is in the same way impossible in an age of printed books (24).

Those of us in the humanities are perhaps more mindful than most of the issue encapsulated by David Bolter (a classicist and a computer scientist): the so-called vehicles of communication, whatever they may be, are likely to shape how we think as well as what we think in a world shaped by that medium. A medium is thus more than a "vehicle" which can be strictly separated from the "tenor" of that which is communicated. Although a medium is in some ways a means, an intermediate term through which an effect is produced, communication media are surrounding or pervasive instrumentalities in which human life takes on its contours. Media not only implement human intentions but they also give shape and limit to certain domains of human endeavor. They make certain things imaginable, plausible and possible. Humanists from Plato to Walter Ong have commented (often critically) upon this constitutive and transformative character of media. Bolter's reformulation of a long-standing insight is timely; it serves as a reminder as we enter an era in which the computer, serving as a new medium for reading and writing, has become commonplace. These brief reflections sketch some of the ways in which the computer, functioning increasingly as a ready-to-hand device for reading and writing, is likely to reshape our practice and understanding of reading and writing.

The computer, of course, has electrified our capacities to manipulate written language. Certainly the high technology culture found before the mass consumption of the personal computer already had some experience with other electronic media and technology which manipulated language; these perhaps prepared the way for the computer, although most do not seem so directly to impact our habits for reading and writing. Future historians may identify the computer as a watershed device in the history of the visible word in just the

An Abbreviated Glossary of Computer Terms For the Hesitant Humanist

Hypertext--Text which is accessible only electronically and is organized with software which allows users to access elements or parts of the text in a non-sequential fashion; often termed simply "non-sequential" or "non-linear" text.

Hypermedia--An extension of non-linear modes of representation to include video and audio; an "enriched" or multimedia hypertext. The term is sometimes used interchangeably with "hypertext" since many principles applying to non-linear text apply also to non-textual media.

Hyperdocument--An electronically accessed document or combination of materials in several media which have been organized in non-sequential fashion.

Node--A unit of text or other information in a hyperdocument; such a unit is the place or locus from which a user of an electronic network of information moves in order to access particular parts (other nodes) of the network.

Link--A connection between nodes of information. A hyperdocument is navigated by the user by activating or following certain links available at a particular node.

same way that the development of movable type is now seen as a watershed. Presently emerging is a generation of adults who simply assume that the best way to produce, preserve and exchange (interact through or with) written language involves use of the computer. Surely this is a cultural development worthy of serious scrutiny, as we human beings struggle to understand ourselves and chart a path which preserves the best of our humane traditions which have most frequently been embodied in written texts.

I. The Luminous and Liquid Word

Computers provide an efficient, economical way to store and almost instantly access the visible word. In a literal sense, computers are recasting our practices whereby we make language visible. Keyboarding and reading the video display are becoming common social habits supplementing habits associated with the production and use of handwritten and printed materials. Many people are familiar with word processing, but it is important to recognize that word processing software does more than make revision easy. Such software is reconstructing our images of writing and of the written word.

Writers using this technology acquire what I have called elsewhere (Mullins) a sense of the fluidity of the word. Certainly, accomplished writers working before the advent of word processing recognized that writing is a creative process in which words can be combined and recombined in a great variety of ways. An examination of older manuscripts of recognized literary masterpieces often vividly shows the ways in which good writers manipulate language. Nevertheless, in an environment in which word processors are a common writing tool, insights about the malleability of writing are common currency. Those whose early writing experience is in a word processing environment learn first, or at least very early, about the liquidity of the written word. For the young child, the unforgiving pencil or pen has a complicated but more forgiving sibling. In a word processing culture, most people (not just good writers) acquire a sense of the word as synthetic and fragmentary. For those who have made word processing skills second nature, the written word has an open texture: we tacitly regard all writing as inviting reorganization and extension. The image of the electronic word focuses attention upon possibility. Those who use word processors come to think of the written document as a fabric of potential meaning constructed of elements woven together. Such persons remain mindful that any given text is a temporal realization of possibilities of meaning. What you have done which is present on screen might have been done differently.

Printed or hard copy in a word processing world is a more locally produced phenomenon than in a world in which printing is a largely industrial activity. The sense of the fluidity of the electronic word and the local control of hard copy production indirectly undermine older book culture's implied values. The notion that the printed word is or can be a deposit of eternal truth is passing away.

This emerging cultural sense of written words as a temporary realization of the possibilities of meaning in a fabric whose texture might have been quite different is in part an ambivalent image at this stage in the diffusion of new writing technology. There has emerged a certain nostalgia for what now appears as the clarity and stability of the written word in an era dominated by the printing press. Recently, the following note about computers and word processors in the legislative process appeared in a column titled "Disturbing Legislative Trends" in the newsletter of my local state legislator: "The speed of combining bills now outpaces our ability to give thoughtful consideration to public policy" (Youngdahl). This humorous remark captures the sense that meaning gets lost in electronic writing, that the speed of the process outpaces human ability to assimilate meaning and that such speed itself perhaps leads to garbled meaning. But is this sense of loss more than the fading shadow of print culture in which visible language was synonymous with a standardized industrial product, the book, with a fixed order?

The emerging sense of the relativity or relationality of the written word should be viewed as an opportunity rather than a threat. Rather than undermining meaning, the incompleteness of the written word should make writers and readers ever mindful that signs operate in a triadic rather than a dyadic context. This is a point well argued—but often ignored—by American philosophers (see Corrington's discussion). Writing is writing for some audience; reading or interpreting is making meaning through inference from the perspective of involvement in some particular community.

II. Non-Linear Text

The development of word processing and its assimilation is probably but a first phase in the growing impact that computers are going to have upon reading and writing practices. Much now is being written about hypertext and hypermedia software. The hyperdocument created by such software is a new form for writing and other media; it is a form which offers contemporary print culture authentically new communicative potential in just the same way that the codex was a new form with some different possibilities than the roll. This new genre of software is likely to extend the impact of word processing, further reshaping cultural notions of textuality and of reading and writing.

Hypertext (sometimes termed "non-linear text") and hypermedia take advantage of the computer's ability to store large quantities of information and put parts of data in potential relation for the interested user. Marchionini describes hypertext this way:

> Two key features of any hyperdocument are nodes and links. Nodes are the information units (e.g., paragraphs, images, articles, individual lessons, etc.) and links are the relations that connect nodes. Defining basic nodes and how they are organized is the first challenge any hypermedia user faces. All systems define and limit how nodes can be represented (e.g., windows, screens). As Conklin (1987) points out, however, links are the essence of hypertext since they facilitate jumping from node to node in non-linear fashion. In printed text, footnote subscripts serve as one-way links to footnotes. In electronic documents, it is possible to created much richer sets of links because the computer makes these links instantly traversable by users (8).

Marchionini's example of the footnote is a good but feeble example of the print hyperdocument's ambience. Footnotes in a traditional printed scholarly paper are a vehicle to provide commentary and resources which cannot be inserted directly in the flow of a paper. But footnotes must be appropriately contained in a printed document. With electronic text, however, any document can be layered with cross references or linkages which are instantly accessible and of almost any length whatever. References can branch off of other references and can themselves become matters primarily occupying the reader. Texts thus acquire the ability to go in many directions simultaneously.

Hypermedia extends to video and audio the possibility of non-linear representation. A hyperdocument can thus link a variety of different media. But whether dealing only with printed materials or some combination of media, it is the computer's instantaneous capacity to access nodes linked together that makes the hyperdocument into something rather different than book culture is accustomed to. It introduces what might be called "thick" organization. Like the anthropologist's "thick" description, thick organization is an enrichment of the possible levels of organization of written language realizable with normal printed text. A hyperdocument embodies multiple sense-making strategies rather then a simple linear strategy. Electronic writing allows many layers or contexts to be woven together in one form.

It seems likely that hyperdocuments will shift our cultural image of textuality toward a more environmental understanding. A hyperdocument is a domain or field with many paths, a textual environment rather than a circumscribed text (something manageably bounded) which in a one dimensional way moves from beginning to conclusion with little variance. The range of material it is possible to knit together (defining nodes and linking them electronically) in a hyperdocument is, of course, vast. Although interlinking of literature is already a feature of print culture, as Conklin argues (37), it seems likely that the scope of intertextuality will expand because the possibility of tracing out paths or trails is machine supported.

"Thickly" organized writing (hypertext) is, of course, a phenomenon which those socialized by print culture will need to become accustomed to. There is no reason, however, to think that readers and writers cannot do so, just as they eventually became accustomed to the codex or the printed book. As users become comfortable, they will begin to exploit the new possibilities for making meaning which reside in electronic text. The present phase of electronic writing is thus simply a transitional phase in the process of redefining the practice of reading and writing.

Literate persons must acquire the requisite skills to create and negotiate hyperdocuments, just as we now create and read printed texts. The constraints which apply to human attention, of course, still apply to reading/using a hyperdocument. Readers can focus upon what they choose in a hyperdocument, but they cannot focus on more than one thing at a time; reading remains largely a cumulative process. In a world of electronic writing, readers must learn to be more discriminating in choosing what to focus upon in dealing with a text which is a multivalent domain or environment.

For the skilled reader, the hyperdocument is an environment which can be explored in a number of ways from a number of different directions. It may be the case that a user/reader of a hyperdocument desires to follow a well-marked, relatively direct trail through material; such a path essentially marks out a set of ideas very like the sequence of ideas, the "case" or "argument", which would normally fit into the world of printed documents. But it, alternatively, may be the reader's desire, not to read "straight through" but to browse through, looking especially for matters of particular interest. Of course, in a literate world that churns out "information" at the rate common today, much of the "reading" done by most people is just this sort. Readers who become comfortable with this style will likely develop a greater tolerance for discontinuity and modularity than has been the norm in print culture.

The problem for readers/browsers in a vast textual environment structured with many layers of linkages is to avoid disorientation and maintain the ability to move through material in an efficient fashion. Much of the current research (see the discussion of Conklin, Marchionini, and Shneidermann) on hypertext systems seems to be focused upon designing "browsers" and query

1482

mechanisms which do in fact allow the reader intelligently to navigate the vast resources which computer storage and retrieval make possible. Joyce argues (11-12) that one way to support reader/user orientation and control in a hyperdocument is to develop more "topographic" aids which the reader uses to negotiate the document. Such a mapping of potential relationships among nodes creates a global orientation rather like a table of contents; while such maps can reduce complexity for readers, it is possible that maps showing linkages can themselves become bewildering.

The hyperdocument writer acquires the power to create a communicative net which moves simultaneously on several fronts. Conklin notes that hypertext loosens conventional constraints impinging upon the thinker and writer: "It does not force a strict decision about whether any given idea is either within the flow of a paper's stream of thought or outside it" (33). While this possibility may sound appealing to print culture writers, it is clear that some new skills must be acquired to be an effective hyperdocument writer. If Bolter and Joyce are correct, it is likely that the prospect of creating such a communicative net (a process of setting up links between nodes) will add to writing more "topographic" dimensions (11-12). That is, the writer or thinker must self-consciously become one who examines and experiments with alternative patterns of node-link connections. The writer in a hypertext system is one who structures a maze and leaves a map for readers who enter this domain. Conklin suggests that authoring has in some senses traditionally been a project of designing a document; in a hypertext or hypermedia system, the writer becomes, par excellence, the designer of a textual environment. Conklin notes, however, that for the writer of a hyperdocument the problem of creating, naming and keeping track of links used in designing a hyperdocument can be overwhelming (38-40).

It is clear, in sum, that the emergence of reading and writing on the computer represents much more than simply the invasion of bastions of traditional humanistic activity by the speed and vigor of Sesame Street. Word processing has already given to written language a new sense of fluidity that was impossible in book culture. Now hypertext and hypermedia systems are bringing into prominence electronic communicative forms which embody meaning in ways linear print documents cannot. To be sure, cultural assimilation of such forms will occur slowly, as readers and writers must learn to deal with the "thick" organization which electronic text allows. The grander organizational potential of electronic text has raised but by no means yet solved the problems of developing human scale organizational devices which allow real human beings to use hypertext at something like its full potential. This will come soon enough, however, because hypertext and hypermedia have already affected our imaginations.

PATHS THROUGH SPACE AND TIME: HYPERMEDIA AND TELECOMMUNICATIONS IN A MULTIDISCIPLINARY HONORS COURSE

The best-laid plans: integrating the computer in humanities education

This Spring semester, I am teaching an honors course which takes up a vast canvas of ideas: from Egyptian religious story and Babylonian mathematical astronomy, through Greek myth and the emergence of "philosophy/science" with the Presocratic philosophers; onto the paradigmatic accomplishments of Plato and Aristotle, and subsequent developments of the Alexandrian school; to the especially Franciscan turn towards nature in the high middle ages as initiating intellectual advances which blossom in the Scientific Revolution proper. Moreover, I hope to illustrate this history from at least four disciplinary perspectives—philosophy, religious studies, history of technology, and history and philosophy of science.

To meet these high ambitions, I have incorporated into the course two computer-based tools. The first, IRIS Intermedia, is a hypermedia program—a program for creating and following non-sequential connections or "links" between diverse units of information. Intermedia attracted me for several reasons—reasons of interest to humanists concerned with education. First of all, while Intermedia makes the creation and reading of hypermedia documents and links exceptionally easy, the program is designed primarily to facilitate the creation of materials which *supplement*, rather than replace, classroom lecture, discussion, and readings. Secondly, when initially used in classes at Brown, the impact of Intermedia on students was carefully studied. Both the original study on Intermedia and subsequent studies on hypertext systems strongly suggest that when students are able to easily traverse the hypermedia links, say, between an analysis of Greek myth and an analysis of early Presocratic philosophy—they better understand and retain the conceptual relationships articulated by these links. Thirdly, while the ease and speed of information retrieval in such a hypermedia environment invites a kind of playful browsing and the pursuit of conceptual relationships otherwise not immediately articulate on the "surface" of a document—such an environment appears *not* to somehow "spoil" the student. That is, after students become accustomed to hypermedia environment, when confronted with traditional print media and the equivalent of hypermedia links in print media (e.g., footnotes, cross-references, etc.), we might expect students to be less willing to undertake the comparatively greater labor of following out these connections. On the contrary: it appears that hypermedia experience *increases* the students' use of traditional print media—in part as it powerfully demonstrates the importance of these manifold connections in understanding the larger context surrounding a given event, idea, development, etc.

Finally, two features of Intermedia make it especially well suited to collaborative learning approaches. One, Intermedia is designed to run on a network of computers. This means that students and instructors, working at the same time, have access to a shared set of resources. Two, as an authoring system, Intermedia provides editing programs for creating different sorts of documents—texts, graphics, and timelines. As electronic files, these documents are as "fluid" as desired: that is, they can be protected so that no further modification is possible—or they can be revised by the original "writer," and/or members of a specific group, and/or anyone who has access to a computer on the network. Both instructor and students are thus able to contribute to the development of a hypermedia document set.

In short, my hopes are that Intermedia would thus dramatically enhance the range of ideas, events, and their often complex interrelationships which students could explore—as well as provide us with a unique vehicle for pursuing collaborative learning strategies.

Secondly, we use electronic mail to further expand the range of material and insights available to both me and my students. We have access to two electronic networks, AppleLink and BITNET. AppleLink, established by Apple Computer, is analogous to CompuServ and other "pay as you go" networks. After paying an initial sign-up fee ($70.00), users are assigned their own AppleLink account address and provided with the latest version of "AppleLink" communications software. Users are billed a minimum of $12.00 per month, which buys 30 minutes of "prime time" or one hour of non-prime-time use of the network. Additional usage is billed on a per-minute basis.

BITNET is a far more extensive network and includes connections or "nodes" at research institutions, universities, and colleges from the Far East through the United States, Canada, and at least one South American country, to the United Kingdom, France, West Germany, and Scandinavia. Thanks to the generosity of Southwest Missouri State University (SMSU), we are able to participate in this academic "global village." SMSU maintains an IBM mainframe connected by dedicated phone lines to the larger network; once connected to the IBM at SMSU, a Drury computer (either a Macintosh or IBM PC) acts as a terminal attached to the IBM mainframe. The program used for creating, editing, sending, and receiving messages and files on BITNET is a bit more daunting than AppleLink. For that, BITNET is much more widely used by academics and there are no direct charges to the user.

AppleLink and BITNET make it possible to send and receive both messages ("mail") and larger files within minutes or hours, rather than in days or weeks. As well, an extensive number of "listservers" exist on BITNET. A "listserver" is typically dedicated to a particular interest or group; a given listserver then functions, either automatically or under the direction of an editor, as a collection point and "broadcasting system" for the exchange of messages on a given range of topics. For example, HUMANIST is a listserver dedicated to discussion of computing and the humanities. A member of HUMANIST can send a query or comment to HUMANIST; after light editing (in the form of grouping a query or comment with others related to the same topic or issue), the message(s) are then sent out as mail to every subscriber. ("Subscribing" to a listserver usually amounts to nothing more than sending the appropriate request over BITNET to a specific listserver. To my knowledge, subscribing to a listserver never involves a fee.) As subscribers read their mail, they may easily reply to either the individual sender or the group at large. The ease and speed with which such correspondence is shared by a large community of scholars over a fairly large portion of the globe makes such a listserver an exceptionally rich, responsive, and far-ranging environment for queries, comments, and dialogue.

Several such listservers are devoted to specific kinds of philosophical discussion. One, the "Noble Savage Philosophers-List" (NSP-L), especially encourages dialogue among subscribers regarding virtually any topic of interest. Last December, I sent a message to NSP-L which briefly described the course and invited participation—in the form of willingness to respond to an occasional query or comment from my class. Especially in a course such as this one, as both exceptionally extensive and multi-disciplinary in its approach, additional expertise was virtually a necessity. As well, given the speed of electronic mail, a query or comment could, in principle, receive a response within the 50-minute timeframe of a class—or certainly by the next class session.

As a result of earlier collaboration on a related project, three colleagues from other institutions had already generously agreed to serve as such "virtual faculty." In response to my note on NSP-L, three more faculty eventually volunteered to engage in such correspondence. As well, we were invited to post an occasional summary of class discussion on NSP-L itself—if only to spark discussion of some of our topics among the NSP-L readership.

The unexpected universe: a preliminary report

As one might expect, experience with these strategies has provided a mixture of disappointments, unanticipated problems, expectations fulfilled—and expectations exceeded in remarkable and sometimes surprising ways. First, the experimental "conference without walls" among several "virtual faculty" has fallen somewhat short of my original hopes. Perhaps this is no surprise: faculty from other institutions, whose involvement in this experiment is neither expected nor rewarded by their home institutions, have little reason to devote considerable energy to someone else's course. In fact, in response to two general postings describing current course discussion and issues, we have received comments and questions from three out of six correspondents. For that, the exchanges which *have* taken place have been lively and exciting. For example, one colleague responded to the initial posting with a self-described "harsh note" criticizing the view (propounded by Anthony Alioto and Daniel Boorstin, among others) that the transition to agricultural societies, the associated need for a solar calendar, and the subsequent development of mathematical astronomy stands as a critical first step towards what becomes Western philosophy and science. In this way, my class was treated to a view and argument which they would not otherwise have encountered—and, I'm pleased to say, they engaged in a spirited defense of Boorstin in a reply. As well, a second colleague—the author of a recently published textbook on the history and philosophy of science—has provided equally valuable dialogue, especially as he has raised specific questions for class discussion as we go along. (This same colleague further provided the addresses for three of his students, proposing that our students correspond directly by way of BITNET. My students, however, have shown little interest in taking up electronic mail on their own—even in response to such direct invitation.)

Perhaps the most impressive feature of using BITNET in the course has been just its unexpected resources—starting with just our most enthusiastic correspondent, who came into contact with our course through the general announcement through NSP-L. Additional examples include a philosopher in the United Kingdom who, responding to a first summary broadcast through NSP-L, sent a message cautioning us about a possibly too-simple distinction between myth and reason; his message further included a reference to an article on African philosophy. This sort of communication is precisely what I had hoped for from our use of BITNET—a serendipitous but most useful reference, as it involved an area of philosophy otherwise unknown to me, my students, and our other active correspondents.

If our experience with electronic mail, while productive, has fallen short of initial hopes—our use of Intermedia has disappointed little and largely exceeded first expectations. In addition, Intermedia had produced some unexpected but positive experiences, along with an unanticipated but significant ethical problem.

As particular examples of the unexpected: without prompting on my part, several students discovered uses which guided Intermedia's design, or confirmed Intermedia's documented impacts. That is, in introducing Intermedia, I did not elaborate on its various uses and documented effects beyond its serving as a vehicle for collaborating learning—partly just to avoid creating self-fulfilling prophecies. Nonetheless, at least one student (out of a class of ten) has discovered the value of Intermedia as a tool for reviewing and preparing papers. Where her notes were not complete, she reviewed the pertinent Intermedia materials. The resulting paper was both exceptionally complete and insightful. In this way, Intermedia lived up to one of its central promises—not as a replacement for good notes and reading, but as a supplement which lessens (but does not eliminate) the burden of notetaking so as to allow the student to pay greater attention to class lecture and discussion.

Another student, one accustomed to the Macintosh interface, browsed through my set of lecture notes for the entire semester in her first session. In this way, she got at least an impressionistic overview of the course which otherwise would have been hard to provide. This experience directly echoes a strategy developed by Peter Heywood in using Intermedia to teach biology at Brown University. The ease of browsing through linked materials invites students to explore materials which may not be formally studied until the later portions of the course. This is especially valuable in a course such as this one, which requires a semester-long research project. By acquainting students with ideas and topics from the entire range of the course, students have a better understanding of the large context of the course. In point of fact, this student has chosen a research topic addressed only towards the end of the course.

In these two ways, then, Intermedia more than lived up to its original design as a tool for *supplementing* class reading, lecture, and discussion. As well, that the students quickly began to uncover Intermedia's applications and confirm its impacts is in my mind compelling evidence of its effectiveness. Intermedia has also met initial expectations with regard to following and making hypermedia links. For example, unprompted comments from one student confirm Intermedia's demonstrated effect of reinforcing and expanding students' understanding of the importance of traditional cross-references. This student—a junior history and political science major—commented that the linking has taught her the importance of following the "See also:" in encyclopedias, etc. That is, as documented at Brown, following hypermedia links seems to bring home to students in a powerful way the importance of following such connections in traditional print media as well. This same student is also using Intermedia to keep her class journal (an option taken up by a few other students as well). In this journal she is incorporating her class notes and comments, materials from other Intermedia documents (including complete definitions from the on-line dictionary), simple graphic illustrations of important concepts, and texts from other reading which she finds pertinent. This electronic journal or "Commonplace Book" is easily one of the best examples of a class journal I have seen.

Class discussion and papers also confirm that making and following hypermedia links generates a greater understanding and retention of complex conceptual relationships. (This experience with hypermedia links, however, also occurs in the context of "electronic conferencing" as a form of collaborative learning. And so my observations on the resulting quality of class discussion reflect both aspects of Intermedia.)

To illustrate: after an initial introduction to the system, the students' received an assignment, consisting of a printed anecdote by Richard Feynmann, and instructions to read an Intermedia document summarizing Anthony Alioto's views on the "motors" that drive the development of science. They were then to open a second Intermedia document, titled "COMMENTS," in which they were to type their understanding of the contrast between Feynmann's description of "the puzzle drive," to which he attributes his work and success in physics, and Alioto's arguments for science emerging from basic human needs. The students were then asked to conclude with a comment on validity of these two different views. This document could then be read by everyone.

As anticipated, this exercise accomplished several goals. First of all, several of the students commented on the way in which the ease of access to information in the Intermedia environment, especially through following the hypermedia links from one document to the next, made such preparations more like play than work. In this way, Intermedia appears to encourage an exploration of ideas and relationships that might otherwise not occur; and, even allowing for their status as honors students, subsequent class discussion demonstrated a much better grasp of the conceptual relationships involved than I had anticipated.

Two, students who tended not to speak initially in class wrote extensively and well in the electronic forum. This phenomenon is frequently reported by other users of electronic communications—namely, that students initially too shy or intimidated to speak in a class setting often wax eloquent in this electronic environment. And, in at least some cases, once students have risked "speaking" in this electronic fashion—they are then emboldened to speak up in class discussion. In particular especially the freshmen students who, as a group, are both intimidated by their "elders" and also the most avid users of Intermedia, do engage in and contribute to this rich dialogue.

Finally, the students arrived in class already familiar with several basic issues and arguments, *and* with some of the views of their classmates. Taken together, these three impacts meant that markedly less lecture time was required for clarifying material and conceptual relationships—and more class time was spent on discussion and clarification of views, including the arguments or reasons for holding particular viewpoints.

Other collaborative learning experiments with Intermedia have worked equally well. For example, when responsible for a class presentation on a current unit of study, students have the option of entering their notes and observations into the Intermedia document set. Interestingly enough, nearly every student has done so. In addition, in a first formal writing assignment, students were given the option of writing a paper or developing pertinent materials on Intermedia. Three class members have undertaken an ambitious project of creating timelines and entering notes based on Daniel Boorstin. Clearly, allowance must be made for the fact that as an honors course, the class has attracted some of our very best students; even so, my strong impression is that the students' entering material which other students will see has fostered a much greater participation in the seminar as a collaborative learning experience. These students are, in any case, the most prepared and active students I've had in ten years' teaching.

Indeed, the student project on Boorstin illustrates still another of the unexpected results of using Intermedia: in several students, it has generated an exceptional and ambitious enthusiasm. As additional examples: two students volunteered to enter the text from Plato's *Republic* describing prisoners in a cave as an allegory for the unreflective life. They then worked with a lab monitor who is not a member of the class, but whose major is graphics arts, to create several illustrations of "moments" in the allegory. These moments were linked by the students to provide a sequential "tour" through the cave for any browser following the links. More generally, a number of students spend far more time on the system than is needed to meet class assignments; in fact, several have volunteered to serve as monitors to keep the lab open beyond hours available with paid monitor staffing.

Finally, these manifold rewards, both expected and unexpected, have also been accompanied by an unexpected ethical problem. Software for network use faces an intractable tension between security and "openness." That is, documents may be kept "secure" (in the extreme, accessible only by their creator and the system administrator) or they may be "open" in varying degrees. In particular, Intermedia allows the creator of a document to determine whether a document may be read, "annotated" (i.e., attached to a web of links), or more generally modified by either other users in a specified group or by any user on the system. Even with these controls in place, Intermedia—as to be expected of a program designed as a vehicle for collaborative learning—is fundamentally "open." For example, while an individual author may keep others from having access to his or her file in varying degrees—the file itself may be easily moved by any other user. This feature was discovered and exploited by one student for the sake of a prank, involving relocating the personal files of the other students in the class in a series of new folders. While most class members responded with understanding and leniency—especially those class members who had invested a great deal of time in developing their materials on the system were outraged.

Of course, any collaborative resource requires a minimum level of ethical responsibility for its use. In this way, Intermedia requires the same basic responsibility of its users as, say, books and personal copies held on reserve in a library. At the same time, the networked computing environment, as an "open" environment, represents a new domain of ethical issues. While analogies for how we treat reserve materials may provide guidelines for ethical behavior with shared computer resources—Intermedia is forcing us to enter unfamiliar ethical territory, at the same time it provides several powerful new ways to approach multi-disciplinary and collaborative education in the humanities.

COMPUTING AND THE HUMANITIES: A CURMUDGEN'S VIEW

Joseph Campbell has recently resurrected a story about computers from out of the 50's when they were first being developed. He tells how Eisenhower went into a room of computers and put a question to them: "Is there a God?" They all lit up, beeped, and hummed, and after a while a voice said, "*Now* there is" (*The Power of Myth*, p. 19). That voice was funny then, but now, several decades later, the devoted enthusiasm directed toward computers by many people, among them humanists, suggests that computers have in fact taken on some kind of divine status in our culture. Is it plausible to imagine the computer as a god—or at least a demiurge—creating a new way of thinking and behaving? Or is perhaps the computer more usefully seen as an intermediary being which assists humans to insights not otherwise available, a sort of *daimon* comparable to Eros as explained by Diotima in Plato's *Symposium*? Or is it a mistake to think of the computer as anything other than a machine subservient to human control?

It is undeniable that the computer has elicited much excitement, even if it is difficult to know how best to envision its role in cultural change. For no one of the alternative views just suggested adequately captures all the roles computers play in our society. Rather, each view suggests some partial aspect of the computer's qualities. For the twelve year old playing a Nintendo game, the computer seems to manifest the divine ability to create an alternative reality. Similarly, the academic lost in a rich hypertext system may functionally tend to see this computer-generated world as *the* world, the product of a brilliant creative act. In addition to seeming like a world-creating god, the computer sometimes seems like an ally in exploration, a mighty computational wizard achieving superhuman feats of analysis. In this, its role as *daimon*, the computer often seems beneficent toward one, as might be expected of a Platonic guardian spirit, yet it can also take on the aspects of a demon. It can subvert one's intentions like an evil spirit. Finally, in many uses, computer technology does not even interact with human intentionality. For instance, a computer chip in an automobile engine coordinating sensor information about engine warmth with control over richness of fuel mixture is simply an exotic tool directed toward a technological end. In such uses, the computer is merely a machine. I conclude that no one view of the computer adequately encompasses the richness of its uses and roles in human commerce.

Indeed, if any one view of the computer is made normative for all its uses, confusion is sure to follow. On the one hand, uncritical admiration of the godlike power of computers leads to idolatrous worship, to use religious language. Exalted preoccupation with what computers can do for one tends towards narcissism, to use Lasch's term. But, on the other hand, if one thinks that in all cases the computer is merely a tool one controls, one is deluded. For the computer does influence what we do and how we think, although often in subtle ways.

My particular concern, however, is not with the computer in its many roles, but with the computer's proper role for humanists. My experience with computers is such that I tend to concur with Campbell's statement that the computer has the feature of the Old Testament god—a lot of rules and no mercy—even as I demur from such a characterization of Yahweh. Many would disagree with Campbell. In fact, I detect in some humanistic quarters a tendency toward an uncritical optimism verging on idolatry. In this essay I'll engage in a hermeneutics of suspicion. Label me a curmudgeon, then. I have suspicions concerning the demonic roles computers may play for humanists.

Does not undue preoccupation with computers and their workings threaten to divorce humanists from their traditional concern with human responsibility and the quality of existence? In fact, has it not become tempting to take the world of computer communication as an adequate symbol for the nature of reality itself? This misguided metaphor does, in fact, seem to have facilitated the widespread acceptance of the thought of deconstructionism. Derrida views the world as a vast network of signs having no center and needing no self. Analogously, hypertext consists of nodes, islands of signs concerning some topic, connected to other nodes according to associative principles which may extend indefinitely. But just as Derrida can dispense with the self as superfluous to his network of signs -- there is no authoritative route through or one correct reading of these signs -- so the committed self seems inconsistent with the enjoyment of hypertext. The committed self shapes the data of experience, with its system of signs, into intended patterns expressive of personal goals and purposes. This is contrary to the pleasure of the text, a disinterested aestheticism characteristic of post-modernism (or exploration of a hypertext). But such aestheticism lacks important qualities of the humanities, which have traditionally been critical and value-centered as well as creative.

The impact of widespread computer usage by humanists must be neither naively overvalued nor ignored as unworthy of reflection. In order to support this point (which is at the core of my curmudgeonly concern), I will call first upon an ancient authority and then on my own experience as a computer klutz.

Actually, the heart of what I have to say is borrowed from Plato. Maybe you haven't run across Plato's rather obscure dialogue on computers, *Nous Kaput*. Don't worry; instead I'm planning on borrowing from some of his ideas in the *Phaedrus*. Socrates tells how the inventor of writing, the god Thoth, came to the Egyptian king and described the marvels of his invention. He talked about writing, but one might equally well substitute "computer" or "word processor" for "writing." Thoth declared, "Here is an accomplishment, my lord the king, which will improve both the wisdom and the memory of the Egyptians" (Walter Hamilton translation, Penguin, p. 96). Haven't similar sorts of claims been made for the computer?—"Soon your modem will give you instant access to the world's wisdom." The king knew better. He (and Socrates) understood writing to be problematic in four major respects.

1. "Those who acquire it will cease to exercise their memory and become forgetful; they will rely on writing to bring things to their remembrance by external signs instead of on their own internal resources. What you have discovered is a receipt for recollection, not for memory." Does not the computer exacerbate the situation? Why remember and internalize complex ideas when with the touch of a key all one needs to know can be pulled up on a screen?

2. The king continues, "As for wisdom, your pupils will have the reputation for it without the reality: they will receive a quantity of information without proper instruction, and in consequence be thought very knowledgeable when they are for the most part quite ignorant. And because they are filled with the conceit of wisdom instead of real wisdom they will be a burden to society." How often one hears teachers say that they are not concerned to teach facts and details so much as they wish to help students learn how to find the answers. I see computer instruction as only further accelerating this tendency. But is there not a danger in this, a danger recently well articulated by E.D. Hirsch in his work, *Cultural Literacy?* Don't we need to have internalized a rich medley of ideas as schemata so that we may think *from* them to find our way about the world of information with insight? Learning how to call up 543 computer entries on Bolivean democracy is not the same as knowing something about Bolivean politics. Isn't a danger of computer technology that we may be able to communicate more material more efficiently to more people than ever before, but have less to say?

3. Socrates continues by calling into question two of the central concerns of humanists. He questions the image as well as the written word. "The productions of painting look like living beings, but if you ask them a question they maintain a solemn silence. The same holds true of written words; you might suppose that they understand what they are saying, but if you ask them what they mean by anything they simply return the same answer over and over again." Ah hah, the computer affectionato may proclaim, here computers have an advantage over the written text, for there are interactive computer programs. And indeed interactive programs can be very useful tools in teaching facts and techniques. But I don't see them as central to humanities education or to our activity as humanists. I'm a traditionalist when it comes to my role as a humanist: I relish the give and take of the student-teacher or humanist-humanist exchanges. When discussing issues with a person, rather than a program, one gains a dimension of richness because one can read the subtle clues of body language, intonation and expression. One best explores issues when one relates them to one's deepest concerns and interests, something no interactive program can anticipate. One challen-

ges and is challenged; one does not simply absorb disembodied data.

4. "Once a thing is committed to writing, it circulates equally among those who understand the subject and those who have no business with it; a writing cannot distinguish between suitable and unsuitable readers. And if it is ill-treated or unfairly abused it always needs its parent to come to its rescue; it is quite incapable of defending or helping itself." It would seem as if there is little to choose between the published book or the public computer program on this score. Yes, Nietzsche may be read, misunderstood, and misused by unsuitable readers with no sense about how they have gone astray, whereas if a person was instructed by Nietzsche in person and then misinterpreted him, Nietzsche would have a chance to correct the erring person (or at least make it clear his thought was misinterpreted). So, too, software and computer technology, in the absence of their creators, are vulnerable to misinterpretation and abuse.

Now it may seem awfully strange that I, a humanist enamored of books, make use of a text criticizing *writing* to criticize *computers*. Without writing I would never have access to Plato's thought in the first place. Similarly, the computer can be a powerful tool for us humanists, giving us access to insights not otherwise available. All that is granted. I do not mean to reject computer use any more than I wish to denigrate the writing I am making use of in composing this essay. But I believe the basic charge Plato presents us with is well founded. The substitution of reliance on writing (whether in a book or on a monitor) as a source of authority in place of comprehension which is "written on the soul of the hearer together with understanding" allows for increased breadth of knowledge, but often at the cost of conviction and depth.

The issues raised by Plato can be augmented by concerns which arise out of my own everyday practical use of the computer (almost entirely restricted to word processing). Again, I choose to focus on the negative, as computers have plenty of supporters who can ably articulate their virtues. I will advance four topics for reflection.

1. Given its computational speed, the computer is a most useful tool in math and science, but I have yet to be convinced that it is essential to the usual work of humanists. Certainly a word processing program makes editing a finished paper more efficient, but doesn't a memory typewriter accomplish most of what is needed? How essential are the toys that attract so much attention? Spell-checkers seem to encourage a kind of laziness and perhaps a lack of care about words. Footnoting programs are impressive, but the academic trend is to eliminate footnotes and endnotes, or at least diminish their importance. What is it about computers that is of central importance to humanists?

2. The cost of computer literacy is much higher than usually admitted, I believe. I recall only too clearly the anxiety associated with first learning how to use a word processor. Then once I was able to become semi-competent in using a computer, there were all sorts of forces conspiring to make it difficult for me to make a fruitful use of it as a tool in my work. The computer I first learned on— an IBM—is

not available in my department, which has a MacIntosh. Then my wife bought a computer for our home to use in conjunction with the lessons she offers as a private music teacher. The best programs for her to use are on an Apple II GS. So I know bits and pieces about three incompatible systems, and I'm master on none. And even if I were to become a master, market forces would no doubt conspire before long to make my knowledge obsolete. New improved programs or computers will soon be out, and if I am to use the new software I'll soon be forced to upgrade my computer. I have not yet acknowledged the waste associated with crashed disks and other failings of computer and user. It seems like I've expended a lot of time and mental anguish for the relatively few benefits of a fancy typewriter.

3. Beyond the inefficiencies and frustrations associated with learning how to operate computers without mishap, I feel as if I sacrifice some genuine values when I make the computer rather than long-hand writing my basic scholarly tool. There is something personal about a hand-written letter lacking in a computer generated letter. A love letter on perfumed parchment communicates in a way that a Commodore message doesn't. Moreover, I find that my memory is very much tied to spatial location, and where I write something on a piece of paper—or where on a printed page a piece of information is located—is a significant tool I use in remembering the concept and in relocating it. But the computer screen offers no such clues. An idea moves across it as you type; it has no privileged place to help me recall it. Also, I find the kinesthetic activity of writing out ideas involves me far more in their meaning than does the more or less automatic action of typing. Somehow, the word processor is just not portable enough or personal enough or error-free enough to suit me.

4. There is a solution to my concerns. It is called a pencil, and it is cheap, portable, flexible, reliable and user friendly. I rest my case.

HUMANITIES EDUCATION CONNECTIONS

Ideas and materials for better teaching and learning in the humanities.

Andrew Flaxman

THE OPEN 'I'
A CULTURAL GUIDE TO PERENNIAL WISDOM

Editorial Note:

In the last issue of Humanities Education, John Lawry referred to an adult education program in humanities and arts called "Educate Yourself for Tomorrow." The creator of this program, Andrew Flaxman, has consented to the pre-publication of his introductory chapter to the guide for the Educate Yourself for Tomorrow seminars and home-study programs. These have been used by business and professional people for personal growth, as in-service learning for teachers, and as seminars for gifted young people.

For hundreds of years, from all over the ancient world, kings and commoners traveled to Delphi to ask the Oracle of Apollo about the right course of action—whether to make war or seek peace, whether to marry one person or another. They brought rich offerings to the god and were sent on their way by the priests with riddling answers.

And yet, over the entrance to the Sanctuary of Apollo at Delphi was the admonition: "Know Thyself!" The true oracle, this ancient wisdom suggested, lies within. The answers to the great human questions, public and private, are found not outside us but only through an inner journey of the seeking spirit. The crucial importance of developing self-knowledge can be best understood in the words of another ancient piece of wisdom: The Hebraic Talmud says, "We do not see things the way they are, we see things the way we are." To make the point again, we grind the lenses with which we see the world.

What exactly is the SELF? Civilized people today generally see themselves in a physical and psychological-religious dimension but remain unconscious of any further aspect of their being. The question is, how do we develop deeper insights so that these unacknowledged elements of intuition, imagination and inspiration become integrated operationally with our conscious everyday lives.

Development of such self-knowledge requires being able to have an "open eye" to what lies hidden all around us and within us too. This process of real education is what liberal arts should be but most often is not. The conventional approach to the Humanities too often consists in rote teaching, memory training and problem solving. Opening the "inner eye" requires experiencing the "I" as an integrated whole, an ego (Latin for "I ") that balances thinking, feeling, and willing. Gaining confidence in this integrative process leads to the ability to distinguish between true intuition and mere whim; between inspiration and empty abstract thought; between creative imagination and disconnected fantasy.

Such personal development swims upstream against the present flow of conventional Western thought. For 500 years Western civilization has developed itself through the exploration and conquest of the "outer" world. This progress has seemed to come from a scientific, materialistic philosophy. The world viewed with this attitude appears separated from our inner being. And yet, if one looks more deeply—imagination, inspiration, and intuition—all spiritual, integrative processes, are at the core of our scientific and cultural discoveries. Einstein, to take one example, has said that he valued his ability to speculate and fantasize above his mathematical skill. The "new physics" is based on doing away with the old attitude that "I am here and it's out there." The observed, say the new physicists studying sub-atomic phenomena, is always changed by the observer.

Yet so much of the way we think and live is structured in dualism, the commonplace way of thinking in terms of either/or, bad/good, inner/outer. Whether our faith is in science, progress, God, human nature or government, we are still on this level of duality in our outlook. Only enhanced self-knowledge will enable us to transcend the temporary illusion of duality and one-sided materialism. This experience of opening the "I" is the breakthrough to the integration of head and heart and creativity that is the core of all reality—the "patterns of organic energy" with which the Wu Li masters of ancient China were concerned.

The need for inner direction is felt by everyone, but many are turning toward various gurus, cult figures, drugs and pseudo-Christianity to satisfy this spiritual longing. Those persons who choose to ignore their own self-development through self-knowledge can become attracted to and become locked into unhealthy, unfree solutions for their doubts, illnesses, insecurities and dissatisfactions.

How do we find constructive help in this difficult journey into ourselves? The great artists, writers, thinkers, statesmen and scientists throughout history right up to the present have communicated to us various aspects of their heightened sense of awareness through their own lives' work. Through artistic forms and significant deeds, they tried to awaken us to a higher view of ourselves. Their examples can make clear to us that we have more than the five familiar senses to employ. Other senses—such as a sense of balance, a sense of love, a sense of yourself and others, a sense of freedom—are as necessary and basic to being fully human as the five more outer-directed, more conscious ones. If we can understand and absorb their gifts of insight, we can ourselves join more completely in the great creative force that drives humankind forward and upward.

So often what we search for is to be found right in front of our noses. It is the same with life itself. It's like a game of hide-and-seek that we play with the self we know now and the self we are trying to find. And the method that we can use is also right before us in our own great culture and tradition. It's only a matter of learning how to "see better" as the loyal Earl of Kent implores Shakespeare's King Lear. However, it's one matter to bemoan the closing of the American mind and the decline of cultural literacy, it's quite another matter to create and promote the solutions to our educational bankruptcy. Realizing that the crisis in education and our society is related to the lack of any inspirational element in the study of Liberal Arts, a group of educators in 1981 organized and tested a curriculum which unifies various topics in the Humanities by the inspirational theme of "Know Thyself!" Since that time, the program has been used by teachers for in-service training, and by adults for continuing education purposes. This book is an adaptation and extension of the program and will serve to open up the eyes of the reader to the vast riches of enlightenment to be found in an appreciation of the Liberal Arts.

The program that we developed centers on the hidden dimensions of the 'I', the SELF, that can be discovered through literature, art and music. This self-developmental thrust goes beyond in the conventional approach to the Humanities found in colleges and universities today. My experience, for example, as a Princeton undergraduate had been to try to understand the works of Plato by studying his writings. In contrast, the unique approach that we have created is to study *yourself* by using Plato's *Symposium* to facilitate the process of self-knowledge. *Self-knowledge is the goal. Plato is the guide*. To those who do not understand the spiritual dimensions of "Know Thyself," self-knowledge appears to be narcissism. To those who have had this inner-experience, it is the path to community service and is true education in the sense of helping to lead out from within what is the best in each of us.

The same approach is taken with the study of the different works selected by our faculty. This presentation creates the conditions for a superior understanding of what has been called perennial wisdom because it constantly blooms. The guided material is based on the familiarity with your own experiences, rather than on some abstract interest in learning, or in obtaining good grades. The motivation in our program is that you are interested in uncovering secrets about yourself. In this way Shakespeare, Rembrandt, Mozart, Lincoln, Jung, Homer, et. al., speak very clearly to every group because everyone is a SELF.

In great contrast to what we have accomplished, Stanford's Western Civilization course has been replaced by a new requirement entitled, "Cultures, Ideas and Values." The new curriculum includes selections from third world, female and minority sources. These changes are part of a recognition that there is something less than universal about the traditional approach to the Humanities. However, the quest for universal relevance in education will continue to go astray (even though the intention is the reverse) so long as Humanities advocates themselves do not realize the *inspirational* mission of higher education for every Human Being, no matter what the sex, color or race. Until this educational goal is discovered, there will continue to be demands for the "Balkanization" of the Humanities.

Because no unifying theme has been consciously recognized and promoted for our secularized education, the Liberal Arts curriculum has become over-specialized and over-intellectualized at the expense of an education of the heart and the will. The way the Humanities is approached today there is very little sense of concrete purpose to develop the whole Human Being. No wonder that every group wants to be represented in such an abstract, theoretical education system, dominated by limited and limiting parochial philosophies.

Of course this successful attack upon the traditional core curriculum of the Humanities did not begin with this past semester at Stanford. The problem stems from the very onset of our modern curriculum development, when we failed to follow the most crucial advice of Amos Comenius (1592-1670), the great Moravian educator who is responsible for many aspects of modern education. For those who are unfamiliar with Comenius, his book, *The Visible World,* was the first textbook in which pictures were as important as the text. He was determined to translate into reason what previously had existed as tradition and describes this intention in his great book, *The Temple of Pansophia.* He wished to construct a Temple of Wisdom as the same type of sacred edifice for education that was employed in the construction of the Temple of Solomon. This temple would be a school of universal wisdom, a workshop into which we are admitted in order to attain skill for everything necessary for life—both the present and the future life—and to be able to do this fully.

To facilitate this grand design, he urged a much broader education to be taught in the vernacular and promoted the establishment of many more schools and universities. He was asked to set up the curriculum for the recently established Harvard College, but turned this position down in favor of organizing the educational system for Sweden. He pioneered the use of academic specialization but warned that *if the spiritual focus were not emphasized, the educational unity would be lost.* We have reached far beyond that point today and know more and more about less and less, leaving us with almost nothing at all in the way of wisdom or any unifying principle with which to appreciate the value of Liberal Arts as it relates to living.

There is little theory or intellectualizing in the chapters which follow. Instead the reader's mind is encouraged to freely engage directly and passionately with great issues that bear upon our lives. Literature, art, and music are here used as tools for informed self-education rather than merely as cultural entertainment to be studied for greater enjoyment or to achieve grades. Memorizing is not required. The reader is encouraged to achieve a heightened sense of individual self-awareness through understanding the study material. Each chapter is presented to engage a more subtle level of thinking by incorporating one's feelings and will in the experiences presented in the course material. The chapters should be read several times at separate intervals. In doing so, the reader will notice many significant insights that had gone unnoticed at first reading.

Although written by a diverse faculty, each with different backgrounds and training, the chapters share certain features in common:

> An understanding of the importance of love in education, and the development of human relationships based on such an attitude.
>
> An appreciation of the Western Tradition of the growth of personal freedom.
>
> A recognition of the ever-changing way we view ourselves and the world we live in -- the evolution of individual human consciousness.
>
> A sense of integrating the whole as well as clear distinction of the parts in presenting each subject.
>
> An awareness of how each subject relates to the experience of "I AM" as the balanced center of thinking, feeling and willing.
>
> An emphasis on the potential for self-development and self-transformation inherent in each individual.
>
> An exploration of the creative and artistic elements in our lives and civilization in addition to the intellectual and problem solving realms.

Under the title of "Teaching History to Gifted Students," four chapters of this not-yet published book are available from Gifted Education Press, P.O. Box 1586, 10201 Yuma Court, Manassas, VA 22110, (703) 369-5017, at a price of $12 plus 10% for postage and handling.

The entire first year's course binder and study guides are available for $120 directly from Mr. Flaxman. This version has each guide written by the diverse faculty and forms the basis for the seminar program. (411 West End Avenue #14C, New York, N.Y. 10024)

EDUCATE YOURSELF FOR TOMORROW SPEED LEARNING ASSIGNMENT SCHEDULE

Topic	Collateral Preparation
1. ART	View Rembrandt paintings mentioned in essay
2. RELIGION	DEMAIN, Hermann Hesse THE GNOSTIC GOSPELS, Elaine Pagels (at least introduction) MEMORIES, DREAMS, REFLECTIONS, C.J. Jung (at least Chapters 10, 11, 12)
3. HISTORY	ABRAHAM LINCOLN, Carl Sandburg (at least Chapters 1-7; 26; 38; 59; 65-69)
4. EDUCATION	TALES OF THE DERVISHES, Idries Shah (at least 3 Tales of your choice) THE LAST BARRIER, Reshad Feild THE RAZOR'S EDGE, W. Somerset Maugham
5. MUSIC	MOZART, Marcia Davenport Mozart's String Quintet in G Minor (K.516) Mozart's Piano Concerto in A Major (K.488)
6. DRAMA	KING LEAR, William Shakespeare
7. SCIENCE	THE TAO OF PHYSICS, Fritjof Capra (at least Chapters 2, 10, 12) DANCING WU LI MASTERS, Gary Zukav (at least through "The Role of the "I")
8. LITERATURE	OEDIPUS REX, Sophocles BLAKE'S ILLUSTRATIONS TO THE BOOK OF JOB
9. PSYCHOLOGY	MYTHOLOGY, Edith Hamilton (at least Herakles and Theseus) FAIRY TALES, Grimm (at least 5 of your choice) PATHFINDERS, Gail Sheehy (at least Chapters 1 and 17)
10. PHILOSOPHY	THE SYMPOSIUM, Plato NICHOMACHEAN ETHICS, Aristotle (at least Book VIII and IX)
11. POLITICS	THE LIBERTY BELL PAPERS, Virginia Moore THE GRAND INQUISITOR, Dostoevski
12. ECONOMICS	SMALL IS BEAUTIFUL, E.F. Schumacher (at least through Chapter 4) MONEY AND FREEDOM, Hans F. Sennholz REINCARNATION AND IMMORTALITY, Rudolf Steiner (at least Chapter 6)

EDUCATE YOURSELF FOR TOMORROW
Second Year's Curriculum
Topics, Books and Recordings

1. ART: LEONARDO, THE TURNING POINT
   Leonardo da Vinci (Abrams Art Book)

2. RELIGION: THE HIDDEN WISDOM OF GOETHE
   Goethe's Word View, Unger

3. HISTORY: BENJAMIN FRANKLIN, AMERICAN INITIATE
   The Autobiography of Benjamin Franklin

4. EDUCATION: HOW TO EDUCATE YOUR "SELF"
   Man, The Bridge Between Two Worlds, Franz Winkler
   Education of Character, Martin Buber

5.. MUSIC: BEETHOVEN, THE SPIRIT OF PROMETHEUS
   Beethoven, W.N. Sullivan
   Symphony no. 3, Beethoven

6. POETRY: DANTE AND THE WAY OF SELF DISCOVERY
   The Divine Comedy, Dante

7. SCIENCE: FAITH AND INTUITION IN SCIENCE
   Fairy Tale: the Green Snake and Beautiful Lily, Goethe
   Quantum Questions, Ken Wilbur

8. LITERATURE: UNDERSTANDING THE MODERN EGO
   The Heart of Darkness, Conrad
   The Death of Ivan Ilych, Tolstoy

9. PSYCHOLOGY: TOWARD A NEW FORM OF CONSCIOUSNESS
   Higher Creativity, Willis Harman
   The Origin of Consciousness, Julian Jaynes

10. PHILOSOPHY: THINKING ABOUT THINKING
    Thinking About Thinking, Alan Howard
    The Place of the Lion, Charles Williams

11. POLITICS: LEARNING FROM HISTORY
    History of the Peloponnesian War, Thucydides
    The Prince, Machiavelli
    On Civil Disobedience, Henry David Thoreau
    Letter from Birmingham City Jail, Martin Luther King, Jr.

12. ECONOMICS: THE PROFIT MOTIVE
    The Worldly Philosophers, Robert Heilbroner
    The Servant as Leader, Robert K. Greenleaf

A GUIDE TO DEVELOPING WORLD CIVILIZATIONS COURSES ALONG THEMATIC AND INTERDISCIPLINARY LINES

THE STUDY OF WORLD CIVILIZATIONS

WHY STUDY WORLD CIVILIZATIONS?

For many years American higher education has considered the Western Civilization course as the pillar of the liberal arts. Its existence in the college curriculum was unquestioned, unchallenged, and seemed as reasonable as life, liberty, and the pursuit of happiness. However, a number of community colleges and universities have now begun to offer freshman and sophomore-level World Civilizations courses within the framework of their social science, humanities, or history departments. In many cases, these courses have replaced the traditional Western Civilization ones.

Studies such as *College Student's Knowledge and Beliefs: A Survey of Global Understanding* (Barrows, 1981) have shown that our students are prisoners of provincialism. Their vision of the world is rather myopic in the sense that it extends to the boundaries of their own backyard, so-to-speak, but quickly becomes out of focus beyond that. Our experiences in the classroom as instructors together with the results of these kinds of studies confirm the necessity for teaching and studying our own culture within the context of world history. The study of World Civilizations can do no less than nourish a greater awareness of and sensitivity to the cultural creativity, richness, and diversity of humankind. A great number of civilizations in the history of our planet have made notable literary, artistic, philosophical, religious, and technological contributions to the global bank of human culture. The World Civilizations course significantly increases the students' opportunity for cultural enrichment and helps them cultivate a concept of civilization as it relates to the *human* experience.

On another level, such a study is arguably as vital to the security of a nation as a strong defense and economy are. This position was in fact the conclusion of President Carter's commissioned study on foreign language and international programs in the American education system. The relationship between a globalized education and a nation's security is clearly recognized in the following statement:

> National security cannot safely be defined and protected within the narrow framework of defense, diplomacy, and economics. A nation's welfare depends in large measure on the intellectual and psychological strengths that are derived from perspective visions of the world beyond its own boundaries. (President's Commission on Foreign Language and International Studies, 1979)

The meaning of an "informed citizenry" had been extended in the late 20th-century to a knowledge of the world beyond local, state, and national boundaries. It implies an understanding of how actions and events in the world community affect the local community, state, and nation. The overriding aim of the World Civilizations course is to assist students in developing a global perspective. Voting age students who are cognizant of the interrelatedness of human beings and cultures and the inherent interdependency of our planetary civilization are in the best position as citizens to rationally and conscientiously deal with the many international issues facing our country and world. Taken a step further, studying other cultures in addition to our own can serve to improve the students' ability to understand the nature and dynamics of our contemporary "global village" which in turn increases the possibility for international order and security.

A GLOBAL PERSPECTIVE

The term "global perspective" is bandied about in the academic world so frequently these days that its meaning is often unclear. The study of world civilizations entails a global perspective, of course, and it is therefore paramount that students understand what is meant by such a perspective. In the introduction to his *A Global History of Philosophy* (3 vols.) the philosopher John C. Plott characterizes a global perspective as

> an absence of provincialism—geographical, cultural, temporal, dimensional. (Plott, 1977)

In the context of studying world civilizations, a global perspective is an acquired and/or improved vision of the world that goes beyond the boundaries of one's own culture, transcends ethnocentrism, and perceives the world in its interrelatedness.

An analogy may be used to illustrate the difference between a provincial and global perspective. If you look through the lens of a telescope you see only a portion of the world close up (e.g., European civilization, Chinese civilization, etc.). When the same telescope is turned around, however, you have a much larger field of vision. At one end, the world is isolated and magnified, while at the other, the vision of the world is much broader and unified. The instrument of vision is the *same* but the perspective is changeable. The study of world civilizations involves intermittently looking through "both ends of the telescope" so that students see the relationship of one culture to another as well as the uniqueness of each.

Acquiring a global perspective in a World Civilizations course requires that the course itself be legitimately global in its scope. It should not and cannot be a Western Civilization course disguised in international packaging. While it may be argued that a Western Civilization course is international in that it covers the cultural history of many nations (e.g., England, France, the United States, Greece, Germany, etc.) it is not global because its course content is confined to only one part of our world: the West. Examining and comparing civilizations in Asia, Africa, and the Americas in addition to those in European history is basic to the acquisition of a global perspective and only when its course content is geographically and culturally balanced can the World Civilizations course serve to improve our students' vision of the world.

INSTRUCTIONAL GOALS

Ironically, the implementation of the World Civilizations course in the community college and university curriculum is often more difficult for teachers than students. Instructors who have mechanically taught Western Civilization since the beginning of their careers and are confronted with the prospect of having to teach World Civilizations manifest a curious array of defense mechanisms. They cling to their traditional course like feudal lords protecting their domains. Some contend, for example, that teaching World Civilizations (rather than Western Civilization) will deprive students of a chance to discover their cultural "roots". Nothing could be farther from the truth. First of all, the study of world civilizations does not exclude Western civilization. It acknowledges Western civilization as *a* civilization among many in world history. Secondly, what many instructors conveniently choose to ignore is that their students are not exclusively of European descent and our own Western civilization has been shaped to a large degree by the influences of other civilizations and their cultural traditions. Our cultural "roots" extend into the global community and are not uniquely European. There should be no question of the appropriateness of the World Civilizations course in the community college and university curriculum and there should be no doubts about whether it can successfully be implemented. It *is* being done and there are several ways of doing it.

The creation of a manageable and relevant World Civilizations course or program (for the students taking the courses *and* the faculty teaching them) first requires articulating instructional goals. The study of world civilizations should be purposeful and this important initial step serves to lend direction to methodology and course content. The goals for the World Civilizations course are *not* the same as those for a Western Civilization course since the focus is shifted to the world. We must remind ourselves that the underlying intention is to introduce students to the growth and development of civilization *not* as a special European or generally Western experience but rather as a global one. The primary instructional goals for World Civilizations courses should include introducing students to different ways of thinking about and responding to the world and improving their ability to see the world in its interrelatedness and how their own civilization has been shaped by the influences of other civilizations (and vice versa). These kinds of goals are essential to the World Civilizations course and the methodology and content of such courses should be evolved from them. It is hoped that the fulfillment of goals such as these will result in the students' acquisition of a greater degree of humanistic knowledge and understanding of our planet's cultural heritage.

THE ROLE OF CULTURE-CONDITIONING

An obvious assumption underlying the goals of the World Civilizations course is that it is possible for students to view and understand the world from a different perspective. Sometimes, however, the skill required to see something from another perspective is more difficult than one would expect. We are conditioned to think about and respond to the world in very specified ways from childbirth. While this conditioning helps us to adjust to and assimilate the values, etc. of the society we live in it can be a hindrance to someone studying world civilizations. Hari Dass Baba, a yogi from modern India, once remarked that when a pickpocket meets a holy man he sees only the saint's pockets. In a similar way, students raised in a western society and/or filtered through a western education system normally see only that which is western and have the proclivity for measuring the ideas and achievements of other civilizations by western standards. Two of the many by-products of culture-conditioning are the acquired ability to easily distinguish the beliefs and values of others from one's own and the inability to view those variances with an open mind. Students who undertake the study of world civilizations need to be made aware of some of the effects of culture-conditioning and the World Civilizations course should provide them with an opportunity for doing so. The question "how has our own world-view shaped our expectations of and attitudes towards others?" is intrinsic to the course. Students cannot be expected to develop a sensitive awareness of how another society thinks about and responds to the world until they become aware themselves that what they carry with them into the World Civilizations course has been filtered through cultural glasses with distorting lenses. The first step in transcending ethnocentrism is recognizing its existence.

METHODOLOGY FOR TEACHING

INSTRUCTIONAL CONCERNS

Instructors cannot expect to teach the World Civilizations course effectively by using the same methodology used in teaching Western Civilization courses. The instructional goals are different and fulfilling them necessitates a different approach. The use of a comprehensive-chronological approach such as that used most often in teaching the Western Civilization course ignores many salient realities which will inevitably doom the attempt. If faculty endeavor to teach everything of significance that has happened in the history of world civilizations it is likely they will overwhelm the students' ability and willingness to assimilate and synthesize the mass of information directed their way. Since most students will have no prior knowledge of, or exposure to, cultural traditions and perspectives other than their own, trying to comprehensively examine and analyze matters that they are completely unfamiliar with is simply unrealistic. Some of the values, priorities, and philosophical and religious beliefs inherent in Asian or African world-views are so divergent from theirs, for example, that even if students could grasp the historical facts attendant to them they would have no way of evaluating and thinking critically about them. At best, students would gain only a desultory and superficial view of non-western civilizations probably remembering only trivial anecdotal information. And, at worst, lacking a frame of reference to assess the given information, students would assume (and their assumptions would be reinforced by ethnocentrism) that since the values and priorities of the non-western world are inscrutable they are not as relevant or meaningful as those of the more familiar West. In addition, time constraints dictate the degree of coverage any faculty can provide students, and, it is axiomatic that instructors are unlikely to be experts on every important aspect of all major world civilizations through history. These concerns collectively represent one of the great dilemmas of expanding the focus of a course to the entire globe and attempting to teach it with a traditional historical approach.

THE THEMATIC APPROACH

One obvious solution to these pitfalls associated with the comprehensive-chronological instruction of World Civilizations is to recast the purpose and nature of the course by allowing for more in-depth focus on and analysis of fewer topics or themes. This will make the course more manageable for instructors and students alike. The purpose of the course should not be to document and detail the history of the major civilizations of the world but rather to examine and compare critically the world-views, infrastructures, and cultural traditions of representative civilizations from various geographic regions of the globe. The course should illustrate the diversity and unity of the human experience with an emphasis on the acquisition of concepts rather than on the accumulation of facts.

From a conceptual point of view, the traditional comprehensive-chronological model teaches history vertically from the top down (or bottom up) so-to-speak. For example, in a Western Civilization course teachers systematically lay down the Greco-Roman foundation blocks in the classroom and the students then proceed step by step, period by period to build an understanding of the world in which they live. In contrast, the thematic approach to teaching World Civilizations courses represents a horizontal paradigm. This is not to say that it denies elements of the vertical one but rather that it provides a different emphasis. As a horizontal paradigm the thematic model tends to collapse distance between civilizations in place and time and emphasizes the essential oneness of human beings. It views civilizations in world history as integral parts of a dynamic whole and de-emphasizes a hierarchical view of them. A hidden danger of using the vertical model in teaching World Civilizations courses to students is that it may unconsciously nurture the view that civilizations in world history exist in hierarchies of importance. That is, some civilizations are "basic" and those built upon the existing ones are somehow more complex and, therefore, of greater importance. With the vertical model world history too easily becomes a stack of separate and distinct civilizations each one greater and more important than the last—a view inconsistent with the desired goals of the World Civilizations course. A thematic approach is arguably the most effective way of presenting World Civilizations to community college and beginning university students if they are to retain anything of value from the course. It gives them a new pair of glasses for looking at the world. If taught with sufficient cultural and geographic balance every student in class should experience some direct affinity for and identity with some aspect of his/her cultural heritage or roots. Further, they should discover an "expanded identity" with the world's population at large and with the general human experience common to all of us.

"UNIVERSALS OF CULTURE" AS THEMES

In selecting the themes for the course one is inexorably drawn to the various "cultural universals" which have been identified by academics over the years. These constitute those universal needs which have confronted and challenged all people and societies through world history. As such they are timeless and remain as relevant today as centuries ago and thus are meaningful to contemporary students who personally identify with them and the related responses of their predecessors. They illustrate the oneness of the human experience and the common struggle faced by all people. This helps students overcome ethnocentrism and misoneism and renders them more receptive to the study and appreciation of cultures other than their own.

By employing cultural universals and the creative global responses to them as the basis for the World Civilizations course the underlying instructional goals can be effectively achieved. Again, it must be emphasized that the aim of the course is not to chronologically and comprehensively trace the evolution and character of the world's "major" civilizations. That attempt can only dampen, if not extinguish, the enthusiasm or at least curiosity about other cultures on the part of students. The instructor must be willing to cast aside his traditional "security blankets" of chronological-comprehensive content coverage of the "major" and "familiar" and set sail on the new and relatively uncharted waters of the thematic coverage of cultural universals and illustrate responses of representative societies to them in a global balanced format.

Many cultural universals have been identified and articulated. Among the most central are the following: (1) providing the basic elements of human existence (i.e., material culture) in diverse natural environments; (2)

developing institutions to provide order and security; (3) evolving social order; (4) attaining, preserving, and transmitting knowledge; (5) providing for creative and artistic expression; and (6) searching for ultimate truths and meaning in human existence. To this basic group of universal needs and responses can be added, additional ones made more evident in the "modern era" such as "assimilating and adjusting to advances in science and technology." One must be circumspect, however, in adopting too many themes relating to various cultural universals, lest one fall into the same traps associated with the comprehensive-chronological approach (e.g., too much material to cover, too little time, etc.). Experience dictates that the most appropriate number of themes to cover in a normal college term or semester is three. One can comfortably illustrate in a globally balanced fashion the creative responses to cultural universals encompassed in that number of themes and can make necessary comparisons, provide discussion, and schedule audio-visual presentations, speakers, and exams. It really seems impossible to do justice, within time constraints, to any more than three themes. That number also seems right for the students in terms of their comprehension, assimilation, and retention limits. The question remains, then, of which of the cultural universals will be selected as the basis for the three themes to be covered during each term or semester. The best approach is to employ two themes continuously during the year as the class progresses from one term or semester and period of focus to the next. The two which provide this "anchor" for the year-long sequence are those that deal with the provision of order and security and with the quest for ultimate truths and meaning in human existence. To some degree the first anchor theme is a hybrid which may encompass, at the instructor's discretion, such things as the provision of effective government; the maintenance of security—both internal and external; the development and nature of the social order; and the provision of economic prosperity. The second anchor theme can also combine various elements such as a discussion of representative world-views, religions and philosophies, with the artistic manifestations of same. These two are especially well-suited to comprise the basic framework and continuity for the year-long global journey through time. It is prudent, however, to provide some diversification of themes (and related universals) as the course progresses. And in some ways, the evolution of world history can be a guide to the most logical variable to be introduced each term to supplement the two constant themes. During the first section of the course, for example, dealing with the so-called pre-historic and ancient worlds, a third theme might be the provision of the basic elements of human existence or material culture (i.e., food, clothing, shelter) and the related development of writing systems. This is an appropriate selection since this quest consumed a proportionately greater degree of human effort and time early in history and was the most central cultural and sociological focus which dictated the character of early societies and their institutions. This theme of providing the "basic necessities" of life is often overlooked or occasionally maligned as a subject so obvious and rudimentary as to be unworthy of academic attention or study. Yet this universal is the most vital of all,

15:3

it is the one upon which all the others are dependent and it is one which has taxed the human mind and engendered great creativity to fulfill. There is nothing so essential to the human experience as this sine qua non—the provision of material culture.

A good choice for a third theme in the course encompassing the "medieval" period in world history (i.e., seventh through the sixteenth century) is that of the attainment, preservation, and transmission of knowledge. One reason is that during this period so many attempts were made in different parts of the world to preserve, sum up, synthesize and interpret all known knowledge and eliminate contradictions, inaccuracies and inconsistencies. Some of this activity was directly resultant from the impingement of the knowledge of one geographic region upon another and the attempt to harmonize it with the existing religious dogma. Another reason for selecting this theme is that great centers of learning arose in such geographically diverse regions as Southeast Asia and Africa and played a key role in preserving and expanding knowledge. And this period witnessed the birth of the modern institutional bastion of learning and knowledge, the university, in such far-flung areas as Europe and India.

For the last term or semester, the most obvious choice for a third theme in the course is that of adjusting to and assimilating advances in science and technology. Certainly this has been important in all eras but especially in the "modern" age. Commencing with the scientific revolution of the 17th century to Toffler's "Third Wave", science and technology have advanced in quantum leaps, radically changing life and values and creating the phenomena of culture lag and future shock. In some ways the adaptation to and assimilation of the new technology born of almost unfathomable scientific advances, poses the greatest challenge to humankind. To meet this universal challenge successfully will guarantee a level of abundance and well-being unheard of in human history. Failure to do so may ultimately spell the demise of life on earth. Clearly, then, this must constitute the culminating theme of the World Civilizations course.

SEQUENCE GOALS AND OBJECTIVES

GOALS AND OBJECTIVES

This thematic approach to studying and teaching World Civilizations explores the history, literature, visual and performing arts, philosophy, and religion of world civilizations. Essentially, it's a comparative analysis of the creative responses of representative civilizations from the major geographic areas of the world throughout the history of our planet to universal cultural needs. The sequence has two primary instructional goals for beginning college students who are pursuing a two-year degree or planning to transfer to a four-year college or university for more specialized study:

1) To introduce students to different ways of thinking about and responding to the world; and

2) To improve the students' ability to see the world in its interrelatedness and how their own civilization has been

shaped by the influences of other civilizations (and vice versa).

Although these are not the only goals for the sequence they are the principal ones. It is also hoped that the sequence will enhance the students' ability to see the world in their own community, foster an attitude of tolerance towards other peoples and their values, beliefs, and customs, and increase the students' awareness that the differences and similarities they might perceive in the study of world civilizations are often times rooted in cultural needs shared by all peoples at all times.

With regard to meeting these instructional goals, this sequence seeks to provide students with an opportunity to acquire and/or improve their critical thinking skills. Specifically, the course objectives for the sequence are:

1) To examine and compare the various ways in which peoples (especially in prehistoric and ancient times) have provided themselves with the basic elements of human existence (e.g., food, clothing, shelter) in diverse natural environments;

2) To examine and compare the various ways in which world civilizations have organized their societies, governed themselves, and maintained security (internal and external);

3) To examine and compare the acquisition, preservation, and transmission of knowledge in world civilizations (especially from the 7th-century to the 17th-century) with an emphasis on intellectual trends, technological developments, and centers of learning and scholarship;

4) To examine and compare the world views of world civilizations and analyze how prevailing religious and philosophical values and beliefs were reflected in the visual and performing arts and literature;

5) To examine and compare scientific and technological trends and developments in world civilizations (especially from the 17th-century to the present) and their impact on cultural development; and

6) To illustrate the significance of geographical relationships in the diffusion of cultural elements and the affect of geography on the development of the infrastructures and world-views of world civilizations.

The sequence methodology consists of utilizing a thematic model with "universals of culture" as themes. These cultural universals are used as a frame of reference in examining and comparing civilizations is Europe, Asia, Africa, and the Americas throughout history. The employment of this methodology will make the courses in the sequence manageable and relevant in relation to fulfilling the instructional goals.

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

FROZEN MUSIC, ETC.

Concerts of the Arts: Their Interplay and Modes of Relationship. William Fleming. University of West Florida Press, 1990. 326 pages, illustrations and color plates. Reviewed by Eve Browning Cole, University of Minnesota, Duluth.

This book has two primary aims: first, Fleming wishes to stress the essential embeddedness of works of art in specific social and historical circumstances which give them structure and meaning; secondly, Fleming emphasizes the particular significance of *music* as a force shaping artists' sensibilities and influencing their creative activity. Traditionally, scholarship in art-history has tended to leave music aside; Fleming's approach is thus refreshing and innovative. The argument of the book invokes a wide range of examples, from ancient Greek temples to James Stirling's Neue Staatsgallerie in Stuttgart (1984), and includes work in many media and genres. Greatest prominence however is given to the Italian renaissance and Romanticism in visual art, and to music of the 'high culture' varieties.

Fleming seeks to show that artistic creativity, though in a sense free from the constraints of time and space (as proceeding from the imagination), is in another and very real sense rooted in a material culture with definite philosophical commitments and values. It is for this reason that diverse works from the same period can be used to illuminate one another. Fleming's research into the interrelationships among artists and art-works takes him into some highly interesting areas, including artists' diaries and correspondence, contemporary criticism, aesthetic theories, musicology, and social history. The result is a vivid portrayal of the working artist *in living relationship* to peers and current trends.

In order to show how the different genres of art, along with individual works, can illuminatingly be viewed in "concert", Fleming develops an apparatus of 'modes', each of which is intended to capture one dimension in which artworks display relationship. This apparatus is potentially quite useful to humanities educators, who continually labor to get beyond the surface parallel and locate substantive commonalities

1517

among artifacts. Although the different 'modes' are not defined with equal clarity, Fleming's illustrations of them are quite perspicuous. For example, the 'analogous mode' (chapter 3) uses music and architecture to demonstrate how a single common philosophical outlook can underlie and motivate work in both fields. In the case of certain Renaissance buildings, echoes of the Pythagorean number-mysticism can be seen to be directly influencing both the architect's vision of the building and the composition of music in which to celebrate its dedication (e.g., Guillaume Dufay's motet for the Florence Cathedral dome of Brunelleschi). Thus Andrea Palladio, well-schooled in the classics, develops a theory of architectural 'harmony' that is more than a metaphor, and which incorporates the musical intervals as proportions for architectural spaces. This theory is then taken over by Inigo Jones, whose subsequent influence on English architecture is profound.

Fleming's style is lucid and engaging, and combines erudition with congeniality to a rare degree. Of architecture in general he writes,

> Far from being mere assemblages of bricks and mortar, steel and glass, every building comes to life with the human activities it was designed to house. I like to think of architects as choreographers who plan their structures so that all who enter must perform a ballet dance as they enter and exit, move along corridors, gather together in meeting rooms, and ascend and descend staircases. (p.29)

The personal note is engaging, while the dance-image is vivid and productive. One takes from this book a sense of having been in the company of a wise and generous teacher, whose enthusiasm for art is limitless and longstanding, and whose deepest desire is that we all come to share that enthusiasm.

Like all teachers, Fleming appears to have some blind spots. I could locate no art works by women among the numerous reproductions or colorplates, nor are any mentioned in the course of the analysis. And Fleming's view of the contemporary art museum is excessively optimistic: "Museums today are the people's palaces that house our humanistic heritage and where the legacy of the centuries is now accessible to all" (35). This begs some very real questions concerning *whose* heritage is housed in museums, who controls entitlement to that heritage, and who really has access. If this book were used in a course (as I think it could well be), it should be supplemented by some of the excellent feminist art-criticism (Linda Nochlin et.al.) and art-history (Whitney Chadwick et.al.) which raise such political questions and thus expand the horizons of discussion.

ST. DAVY & OTHERS

Catherine L. Albanese, *Nature Religion in America: from the Algonkian Indians to the New Age*, Chicago: University of Chicago Press, 1990. 267 pages. $24.95. Reviewed by Bron Taylor, University of Wisconsin, Oshkosh.

Religion is, according to Catherine Albanese, the "way or ways that people orient themselves in the world with reference to both ordinary and extraordinary powers, meanings, and values" (p.6). The ordinary is found within the boundaries of human society, the extraordinary outside of the boundaries of this community. To understand religion, then, one must understand more than that which commonly passes for it, more than that which is concerned primarily with "supernature."

"Nature Religion" is the term Albanese gives to beliefs, behaviors, and values which take nature for its symbolic center" (p.7). In this provocative work she sets out to show that nature religion, or at least the "natural dimension" of religion, "has provided a compelling religious center for many Americans throughout our history, [and] nature as a religious symbol has become so effectively a culture broker that the study of nature religion can cast an important light on persistent patterns in past and present American life" (p. 200).

Albanese develops these themes by focusing on many important persons and movements—some not typically seen as religious. Throughout, she attends not only to how nature functions as a symbol within the various systems of *thought*, but also to what types of practices, and especially *ethical* practices, were given impetus by these symbol systems. Specifically, she summarizes first the radically different ways nature functioned as a symbol among Native North Americans and the invading Anglo-Puritans. She goes on to provide an interesting account of how (much later) Cotton Mather and especially Jonathan Edwards promoted Platonic notions of correspondence thereby providing fertile ground for the emergence of transcendentalism (p. 44).

She then examines what she labels the "republican" (here her usage closely parallels what other scholars call "civil religion") ideology of nature in the revolutionary era, discussing how enlightenment notions of "natural law" and "inalienable natural rights" involve nature as a *religious* symbol that ultimately legitimated pernicious notions of manifest destiny. (Especially fascinating here is the portrait of Masonic nature religion, and nature symbols in the thought and ethics of Thomas Jefferson—both of which helped shape the nation at its founding and finally promoted notions of manifest destiny. Equally intriguing is her analysis of the nature-cult of the mythic saint Davy Crockett, with its racist-nationalistic ethics.)

Next she turns to more peaceful representatives of nature religion, in transcendentalism and its legacies. She argues that transcendentalism rested on a central confusion in attitude toward nature, and that the resulting dilemma led to two distinct ethics. On the other hand, nature was thought of as the "really real," and the ethical priority then must be to preserve and live in harmony with it. On the other hand, there was a more metaphysical vision, which placed a premium on transcending nature, or mastering it through *mind*, because reality, ultimately, is spirit.

Albanese shows how Emerson, Thoreau, and John Muir all embraced both sides of the paradox. While they placed a moral priority on preserving nature they nevertheless believed it corresponded to and provided a pathway toward that which is even more real and valuable. Meanwhile others located their ethical priority in lives committed to the healing arts—some stressing the prevention and curing of disease through physical manipulation of nature (examples discussed are the Christian physiology movement and various "sectarian" medical movements, including Thomosonians, homeopathies, hydropathies, osteopaths and chiropractors); others believe in mental/spiritual mastery of nature and disease, sometimes by denying the very existence of disease and matter itself (those discussed here include Phineas Quimby and Mary Baker Eddy and her Christian Science). The confusion over nature as "real" or "ideal" produced, according to Albanese, a second ethical dualism: on the other hand, the impulse was to harmonize one's life with nature, on the other, to master and control nature through the manipulation of matter and/or spirit.

Finally, Albanese takes us to the 20th century, discussing the nature religion(s) that underlie contemporary Green movements in Europe and North America, eco-feminism and the reemergence Goddess religion, and various forms of pagan and new age religions. She also looks at the religious dimensions of health (prevention and healing) movements, showing their links to 19th century healers—some stressing mind, others matter, in their healing cultus. She shows how the dual-ethical impulses derived from earlier confusions about the nature of nature continue today. But she also finds today a greater syncretism among the various forms of nature religion—and this syncretism, she seems to suggest, may be synthesizing ethical impulses which were previously in conflict. This new syncretism, she believes, may have its origins in the dawn of quantum theory early in the century. Further, she concludes, this theory has at last "resolved the conceptual conflict between nature real and nature ideal..." (p. 200). She contends, essentially, that the opposition between the ethical ideals of harmony versus dominance, and between environmental protection and the impulse to transcend nature, have begun to dissolve under light of the sub-atomic microscope.

Albanese has argued that nature religion is alive and well, and that "the presence of nature religion in America is one more sign that, in a 'secular' society, the search for the sacred refuses to go away" (p.200). This volume helps alert us to the multi-faceted forms and internal tensions of nature religion. Her work should be of interest to a wide range of scholars, from those interested in the intellectual and social antecedents of environmentalism in America, to those investigating the various persons and movements discussed, and of course to scholars responsible for interpreting religion in the classroom. The work could also fit well into upper division courses dealing with the philosophical and cultural dimensions of environmental controversies, as well as courses exploring religion in America. Albanese intended through her project to encourage discussion about nature religion in America—her contribution has provided a rich conversation piece toward that end.

I SORT OF TAKE A STAND

"Neutrality in the Classroom: An Idle Threat?" by Leonard J. Berkowitz in *Perspectives* 20:2 (Summer 90). Association for General Liberal Studies, Penn State York Campus, 1031 Edgecomb Avenue, York PA 17403. $30/yr. membership.

At first glance, the idea that the teacher should maintain a stance of neutrality in the classroom is right down there with the apple pie and mom as a cornerstone of American values. The situation can arise in any humanities classroom that a controversial subject is introduced. For many teachers, especially in subjects like ethics, arguable issues are the very stuff of the course. The teacher's responsibility is to present or help to present all sides and assist the students in developing skills in criticism of the various viewpoints. But the teacher's responsibility is also to avoid advocacy or even preference for any viewpoint. Complete neutrality is the highest virtue. Our whole faith in liberal education is based on the idea that we train young citizens in critical thinking so that they can make rational decisions on their own.

Nevertheless, there are critics of neutrality and their voices are growing louder. The religious and political right have always insisted that, for example, Christian and American education should teach values—the right values. There have also been critics on the left like Herbert Marcuse who say that students are so thoroughly indoctrinated in bourgeois values that the teacher should advocate anti-establishment views. In short, to be neutral is to support the establishment.

The ethical scandals of recent decades in business, medicine, religion, law, government, and politics have made the teaching of ethics the hottest commodity in the liberal arts game. But what professional schools and the public want, say Berkowitz, "is not teaching *about* ethics, but teaching students to be ethical." The most serious attacks on neutrality, though, have come from within the academy, and Berkowitz, who edits the AGLS Newsletter and teaches at Penn State, provides useful citations. Essentially, their argument is that neutrality intensifies the pernicious relativism that infects our students. Berkowitz' experience is that only the better students hold this attitude that one view is as good as another. Most of his students "have not even reached that stage" and blindly accept the doctrines of "parents and peers."

There are other anti-neutrality arguments, and vigorous defenses of neutrality, leaving the dilemma: "If neutrality is unacceptable, and advocacy must also be avoided, what should we do?" The answer is a middle ground. We should *advocate* taking positions, we should *advocate* the process of reason as a means of deciding, and we should be "*intolerant* of obviously intolerable views and bad reasoning." (F.S.)

NOT SO FAST

"'Style' and Technology" by Joseph C. Pitt in *Technology in Society* 10(1988). Pergamon Press, Maxwell House, Fairview Park, Elmsford NY 10523. $85/yr.

Why haven't we blown up the world or totally poisoned our planet? Goodness knows we've got the technology. Pitt, who directs the Humanities, Science and Technology Program at Virginia Polytechnic Institute, thinks he has the answer, if not a promise that we'll continue to hold technology at bay. His argument is complex, but it begins with the need for us to re-orient our thinking about technology. Most people think that technology is a "mechanical thing" separate from society. Not so. Technology is "humanity at work in the world," systems and structures developed by humans on response to human needs and goals. In the early decades of this century, technology was further misrepresented by the myth that "technology was merely an afterthought to science." The reality is that the relationship is reciprocal; sometimes the reverse is true. Both are equally rational.

Pitt defines rationality in an almost folksy way. Rationality is no more than an extension of common sense. Common sense is a process in which you decide upon an action based on (1) what you already know, (2) your goals, (3) your values, and (4) the available options. The important thing to understand is that "rational decision making is the process of constantly revising one's knowledge, goals, and values in the light of experience." Thus, rational beings do not repeat mistakes. A key problem, however, is having "right goals." To Pitt, right goals are those that are in accord with society. These goals are not absolute or permanent, though some may persist for a long time and change slowly. Our personal goals, of course are subject to change as we have experiences (as your teen-age goals, parental goals, professional goals, etc. change); the same is true of society.

Now as to *style,* Pitt defines this as a consistent pattern of rational action in "accordance with the predominant value system." Those with the greatest style, therefore, are our leaders and heroes, because they embody and epitomize their society's values. This kind of leadership is in danger today, because technological innovation is advancing too rapidly for the community's goals to be readjusted. It's a danger, but Pitt is optimistic that common sense rationality is working to curb technology. We have made errors, mostly of the type that maintain that because we *can* do technological magic, we *must* do it now. Rational, reasonable people learn from their errors. It may be that the heroes of today, the leaders with style, are the whistleblowers. (F.S.)

FROM COSMOS TO BOXES

"Architecture and the Political Society" by Thomas Molnar in *The Intercollegiate Review* 26:1 (Fall, 1990). Intercollegiate Studies Institute, 14 South Bryn Mawr Avenue, Bryn Mawr, PA 19010-3275.

Post-modernism in architecture may be clumsy, grotesque, burlesques of historical styles, but the movement clearly opposes the monotonously functional blocks of Bauhausian buildings that have dominated public architecture for the major part of the twentieth century. We may be turning away from Gropius, Mies, Le Courbousier, but should we be blaming them for our cityscapes?

It's not that simple, says Molnar who is variously professor of French literature, religious studies, and political thought. The roots of modernism go deep, even into the eighteenth century, when architecture began to have two objectives, one, "experimentation with pure geometrical forms," the other to "surrender the art of building to every day human needs." The first abstracts form in a mechanistic way, the second substitutes economics for sacredness. The earliest architecture replicates the cosmos in temples, of which Molnar says "nothing is more representative of a civilization than the relationship, established or imagined, between the cosmos and its earthly replica." Furthermore, such structures as Egyptian temples, Mayan pyramids, Greek temples relate fully to their natural settings, in most cases with a sophisticated tension between the cosmic power of untamed nature and the imposition of human order upon a segment of that nature.

With Christian architecture this changes: no longer open to winds, framing nature, celebrating the gods of nature, the Christian church is enclosed, a shelter for communicants from the satanic perils of the material world and the city of man. Churches did not seek out sites of natural drama and cosmic power: "Churches are supposed to be everywhere at home; since space comes from God there are no privileged places except those designated by sacred history itself, like Jerusalem, Bethlehem, and Rome."

Developing beside Christian architecture was the architecture of civic life—town halls, splendid houses of bankers an guilds—and the churches, Molnar says, become one of the "town's civic expressions." It's not a leap to the geometric, unornamented boxes of the twentieth century, but it is an evolution for architecture as expressive of the natural cosmos to an expression of the highest values of our world: mechanical efficiency for moving and placing people and things wherever industry and bureaucracy dictate. (F.S.)

HISTORICAL JOBS

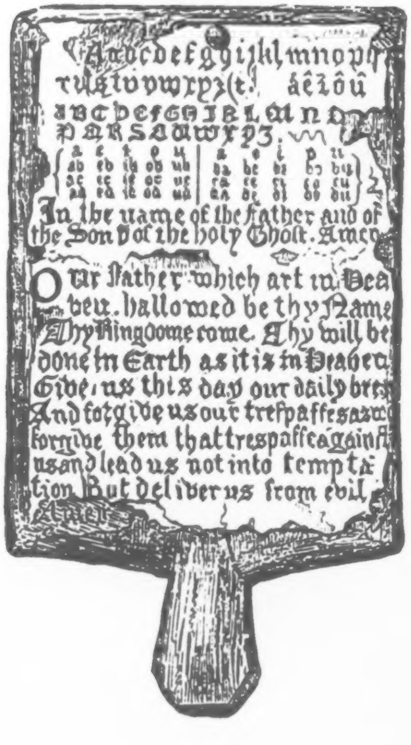
"Choosing History as a Profession" in *History News* 45:6 (November/December 1990). American Association for State and Local History, 172 Second Avenue North, Nashville, TN 37201. $50/yr.

"What can I *do* with a major in the humanities?" is a familiar question for college and high school advisors. Time was when the obvious (and practically only) answer was: Teach. We have passed through the doldrums of the 1980's when teaching jobs in history, English, philosophy, and humanities were as rare as hen's teeth, but during the past decade or so the tough times for history teaching have caused many history professionals to take a broader view.

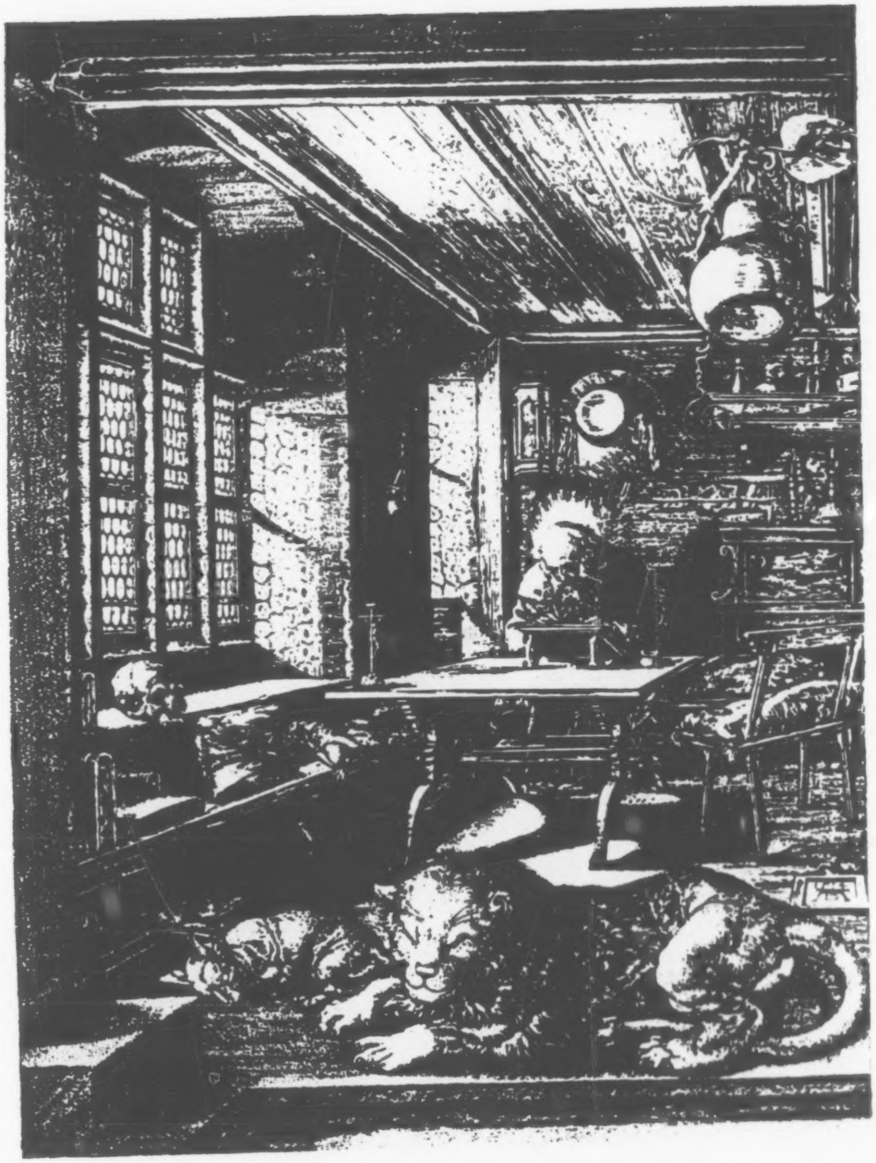
This article, written by a *History News* staffer, neatly encapsulates the various opportunities. The watchword, though, is that whatever you choose, you'll need to go beyond pure historical training or even interdisciplinary academic study. The knowledge of history is central, and even more, the *love* of history is essential, but the skills needed might include fields such as art training, management, photography, audio-visual technology, preservation technology, library science, editing, printing, marketing, and others.

Where are the jobs outside of teaching in schools and colleges? There are large *historical societies* with many specialist areas, and there are small historical societies where jacks and jills of all trades are needed. *Museums* (which may or may not be attached to a historical society) have a similar range from the giants with many specialized departments to the local museum where one or two professionals must be exhibit preparators, fund-raisers, volunteer coordinators, and heaven knows what else in addition to being historians. An important growth field in museums today is the education field. *Historic preservations* is a third area where a mixture of research historians, architects, art historians, planners, and lawyers are needed. There are *government jobs* in history, perhaps not so commonly, but such agencies as the Bureau of Land Management, the Forest Service, the Corps of Engineers, and of course the Smithsonian, the Library of Congress, the National Endowment for Humanities will advertise positions incorporating history. *Historical publishing* is found not only in societies, museums and university presses, but in commercial presses, popular journals, and even in some businesses. *Archives and libraries* can offer opportunities: "In museums and historical societies, in private industries, and in large libraries, archivists are being hired to assemble, catalog and organize the textual materials that constitute the primary documents of historical research." *Free-lance historians* are becoming more common, too, writing company or family histories, doing genealogical research, consulting on historic preservation and other things where specialized research skills are needed—and valued.

The article ends with short but sensible advice on how to enter professional fields after (or while) completing the appropriate education. The article is not long, but it packs a lot of information and cautionary advice that might well be kept on file for when the student asks "What can I *do* with a history major?" (F.S.)



In the name of the Father and of the Son & of the holy Ghost. Amen.
Our Father which art in Heaven. hallowed be thy Name
Thy Kingdome come. Thy will be done in Earth as it is in Heaven.
Give us this day our daily bread.
And forgive us our treſpaſſes as we forgive them that treſpaſſe againſt us and lead us not into temptation But deliver us from evil.
Amen.



EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with content that draws upon the human cultural heritage, methods that derive from the humanistic disciplines, and a purpose that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity**, **humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have word-processed your article, please specify the program you used (we use WordPerfect). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

CHRISTIANITY AND CULTURE: INTEGRATIVE STUDIES IN THE CORE CURRICULUM

BACKGROUND

One of the most controversial issues in higher education is the so-called Core Curriculum, a series of courses required of all undergraduates. The knowledge and skills imparted by such courses are essential to the development of the "educated" person. Thus, the Core Curriculum is a set of requirements more fundamental than the major and minor fields of study in the humanities and very different from the vocational preparation leading to careers. The controversy over the Core Curriculum, evident in reports from the National Endowment for the Humanities, the Department of Education, and various private foundations, derives from two central concerns: the number of credits and the makeup of the courses. In most cases, between 20-30% of the credits required for graduation are taken in the Core Curriculum, which usually features integrative courses that cut across disciplinary boundaries. To recount how one university devised a Core Curriculum and how two of its professors developed an integrative course therein will provide a model that may be adapted elsewhere, particularly when the course centers on the interrelation of religion and culture.

Beginning with the entering freshman class in the fall of 1987, undergraduates at Duquesne University are required to take courses in the newly established University Core Curriculum. This requirement extends to students in Arts and Sciences, and in the professional schools: Nursing, Business, Education, Pharmacy, and Music. A total of twenty-seven credits (or nine courses) make up the Core Curriculum, which stresses subjects, issues, and values central to the liberal arts tradition and skills essential to lifelong learning. Accordingly, students are taught the history and cultural heritage of the West, the diversity and richness of other cultures, societal structures, the role of science in the modern world, the interaction of the arts and human experience, the process of defining personal identity and values, and the importance of religion in culture. The skills that are practiced include the following: speaking and writing clearly and persuasively, making informed judgments, and thinking analytically.

1531

The Core Curriculum was devised and initiated only after extensive research and deliberation by faculty committees that reported to the entire faculty. In planning the Core Curriculum, the various committees and the entire faculty encouraged the development of new courses, which were to be team-taught and through which two or more disciplines were to be integrated. Faculty members from the numerous departments in Arts and Sciences were urged to collaborate not only among themselves but with colleagues from the professional schools in order to plan, propose, and offer pilot courses in integrative studies.

CHRISTIANITY AND CULTURE: PHILOSOPHY AND GOALS

Because the two of us in recent years developed similar interdisciplinary interests as teachers and scholars, involving theology, cultural perspectives, religious literature, and the visual arts, we agreed to collaborate in developing a course for the Core Curriculum. The particular course that we developed—Christianity and Culture—was an outgrowth of our various academic interests and also a manifestation of the philosophy underlying the Core Curriculum. To guide the process of planning, we framed the following objectives for our course:

(1) integrate theology, cultural perspectives, religious literature, and the study of art;

(2) present a historical outlook across the eras of Western culture, most notably Early Christianity, the Middle Ages, Scholasticism and the Renaissance, the Reformation and Counter-Reformation, and the Modern Era;

(3) select representative but interactive trends and movements in theology, literature, and art from each era;

(4) provide opportunities for students to think and speak analytically in class and to write analytically outside of class;

(5) develop in students the self-confidence and proficiency to interpret a literary text and work of art.

INTEGRATION OF COURSE CONTENT

To implement our objectives, we devised a virtual course outline. Our detailed preparation resulted from intense collaboration as we unfolded our respective views, then integrated them in order to be selective but representative in what we chose to teach from a particular era. In relation to Early Christianity, for instance, we agreed with little difficulty to teach selections from the Four Gospels. To organize our outlook, we adopted a point of view. Mark's Gospel became the means by which we taught the concept of the suffering Christ—the so-called "low Christology" emphasizing the humanity of the Son. This concept of Christ was related to the cultural experiences of Matthew's Community, Christians themselves who were suffering. The Roman Church was to have been encouraged by Mark's account that suffering is the means to eventual triumph, the transition—low to high, humiliation to exaltation—for which Christ himself was the exemplar. Therefore, we chose for emphasis certain passages from Mark's Gospel that deal with the Passion and Death of Christ.

To reinforce our interpretations, we used color slides of illustrated Bibles, paintings, sculptures, and stained glass in which the suffering Christ was depicted. These illustrations, most notably of the scourging, buffeting, and death of Christ, highlight graphic details of suffering, not simply to be realistic in their portrayals but to elicit an affective or emotional response from viewers—sympathy, sorrow, contrition. This response to art is the affective counterpart of an intellectual and theological awareness, which recognizes humankind's dependence on the godhead for merciful forgiveness and salvation. Accordingly, Christ's bloodshed in art is the symbolic representation of the outpouring of mercy, the onset of regeneration, and the offer of salvation.

Enriching our outlook on biblical texts, theology, and art was our use of the Early Christian typological perspective, a means of interpretation that juxtaposes and, in effect, integrates the Old and New Testaments. In art, the typological perspective is manifested in Old Testament prefigurations of Christ's suffering. Thus, we showed slides of Moses striking the rock, from which water emerged, as an Old Testament episode anticipating the issuance of blood from Christ's side. By our interpretive outlook, we correlated the wood of Moses' staff with the wood of the cross. Another pertinent Old Testament prefiguration is the brazen serpent. To restore the health of the Israelites bitten by poisonous serpents, Moses uplifted a brazen or bronze serpent on a pole. The serpent entwined on the pole often resembles the "S" or "Z" configuration of the crucified Christ contorted by suffering. Such an image acquires further symbolic value in relation to the Hellenistic icon of the healing serpent, the caduceus. Christ the sufferer, whose blood is likened to a balm or panacea that alleviates the affliction of sin, becomes Christ the healer.

The foregoing account exemplifies the depth and detail of our interactive planning. It also will suggest how the planning of one element in the course, Mark's Gospel, led quite naturally to the next. To achieve balance but contrast, we approach John's Gospel from the standpoint of "high Christology"—the emphasis on the pre-existence of Jesus before the Incarnation. In other words, Jesus had pre-existence and glory in Heaven before the world began. From having been with the Father on high, he descends to be with humankind below. In John's community, the theological emphasis is on Jesus's oneness with the Father. Rather than perceive the realm of God as a place, one need only join with Jesus to achieve union with the deity. Slides that we chose for presentation and interpretation showed Jesus in Heaven before his descent to earth. Flanked at times by the Father and the Holy Spirit, both of whom are rendered anthropomorphically, Jesus appears virtually indistinguishable from them. The cosubstantial and coessential unity of the three Divine Persons is thereby signified.

As we proceeded in our planning from the early Christian era to the Middle Ages, we were concerned to select a significant work of literature reflecting the dominant theology of the period. St. Augustine's *Confessions* fit our needs exactly. Underlying Augustine's outlook is an acute awareness of the majesty of God and the fundamental depravity of humankind after the Fall. Reason, inherently flawed, is insufficient as a guide to salvation. Augustine's conversion comes at the climactic moment when he announces his dependence on God, an expression of faith that leads to intense illumination. In effect, Augustinian theology is a form of Christian Neoplatonism. To examine how literary technique in the *Confessions* effectively communicates the theological outlook, we highlighted the autobiographical structure of the work and its imagery—especially the association of reason with darkness and faith with light. We also sought classical and biblical antecedents for Augustine's travels and conversion. In particular, we focused on Odysseus' journey as the classical counterpart of Augustine's quest and on St. Paul's conversion as the biblical prototype.

Such intense planning and consistent interaction were mutually enriching. Rather than remain confined in our respective disciplines, we at times reversed roles—the theologian adopting a literary or artistic perspective, the literary scholar and iconographer immersing himself in the theological outlook. As the follow-up to role reversal, each of us recommended readings to the other. While planning the unit on Early Christianity, Worgul urged Labriola to read Raymond Brown's *The Churches the Apostles Left Behind*, a study of the interaction of culture and theology. Labriola, when planning for the Middle Ages, particularly the unit on Gothic art and architecture, recommended that Worgul read Emile Male's *The Gothic Image: Religious Art in France of the Thirteenth Century*. The effect of role reversal and of the supplementary reading was to collapse disciplinary boundaries, a prerequisite for our effective performance in the classroom.

An offshoot of our intense planning was the development of a more comprehensive syllabus and course outline than we could ever teach. For the Reformation and Counter-Reformation, we planned a unit on spirituality and mysticism, involving St. Teresa of Avila and St. John of the Cross. Artistic counterparts include the baroque movement, exemplified in Bernini's *St. Teresa in Ecstasy* and in the paintings of Caravaggio and El Greco. In the Modern and Contemporary period, we designated certain poetry, most notably by Gerard Manley Hopkins, as evidence of the reaffirmation of faith in the midst of skepticism. While the foregoing topics have never been presented in class, our intent in being comprehensive was to have at hand a range of prepared topics from which to develop, by representative selection, a syllabus for the students. We also wished to have a rich selection of material in order to interlock by comparative study certain topics across different historical periods. If, for example, we taught a medieval drama such as *Visitation to the Sepulchre* and showed a videocassette of the play, we might plan to use Samuel Beckett's *Waiting for Godot* in the Modern and Contemporary period. Whereas the medieval play charts the transition in the three Marys from sorrow, even near-despair, to joy when they behold the risen Christ, *Godot* dramatizes the erosion of faith as the principal characters wait interminably for a manifestation of the godhead in the human condition. This example also illustrates a larger principle in the course—later analysis unfolds, in part, from previous interpretations.

TEACHING IN THE CLASSROOM

More than we anticipated, the integration achieved in preparing the course affected our outlook on teaching. We chose to teach the course at two meetings (each seventy-five minutes long) per week. One of the reasons for choosing the longer period was to enable the two of us to teach at each meeting, a practice essential, in our view, to the success of the course. Our aim was to impel students to develop an integrated perspective during every class. On some occasions Worgul would first provide the theological basis for the analysis of art or interpretation of literature that Labriola would undertake. In the unit on Gothic art and architecture, for example, Worgul highlighted the cultural and theological contexts underlying the medieval world-view, which stressed the transcendence of God, the manifestation of his power through light, the revelation through Scripture of his relationship with humankind, and the aspiration and struggle of humankind to journey toward union with God. After Worgul further elaborated on each of the foregoing theological premises, Labriola showed slides of Gothic cathedrals. In his analysis, however, he built on Worgul's observations by encouraging students to interpret visual details in relation to theological premises. Beginning with the outside architecture, Labriola showed, for example, a distant view of the cathedral of Chartres. Located on a hill and visible from afar, particularly its spires, the cathedral was the destination of medieval pilgrims. The students likened the medieval pilgrimage to the biblical journey to the Promised Land. Slides providing a closer view of the cathedral enabled students to perceive resemblances between the stone exterior and the craggy mountain whereon Moses communicated with the transcendent godhead. Over the main door at the west facade is the royal portal, a sculpture in stone of Christ in session, which students recognize as a dominant image in the medieval world-view. Doomsday and the Last Judgment were the crucial events for which one developed and maintained a state of spiritual readiness.

As the students entered the cathedral vicariously, they underwent the experience of pilgrims and perceived their surroundings from the theological and cultural perspectives of the medieval world-view. Inside the cathedral, one's attention is drawn upward by the architecture of ribbed vaulting and pointed arches, an orientation toward the transcendent godhead. At the same time, the intake of light through numerous stained glass windows suggests the presence and power of God in the human condition. When the students were directed to particular biblical episodes depicted in stained glass, they interpreted the events in relation to Providential history and the theology of salvation. Based on what they had learned in the unit on Early Christianity, they detected relationships between scenes from the Old and New Testaments. As such, the windows of the cathedral were a virtual "Bible of the Poor," whose audience was chiefly the illiterate folk. The intersection of the main aisle or nave with the transept creates a cross-like effect, the top of which rests at the eastern end of the nave, where the sanctuary is located. The students reasoned that the image of the cross, the chief sign of salvation, directs one's movement through the cathedral and, in effect, along the journey of life toward union with God.

The foregoing deductive interpretation actively involved students, whose observations, as they viewed the slides, emerged from and were correlated with the theological premises of the Middle Ages that Worgul had expounded. At times, however, the process was reversed, so that Labriola gave the earlier part of the presentation, encouraging active involvement by the students in the interpretation of literature and the visual arts. Thereafter, Worgul developed the theological premises and cultural perspective underlying the detailed analysis. In such a situation, Worgul deepened the inductive reasoning of the students—to synthesize details, to perceive relationships therein, and to derive inferences.

Whether we proceeded deductively or inductively in a class meeting and despite the order in which each of us gave his presentation, the paramount concern was to demonstrate the method of interpretation with which we expected students to become proficient and, eventually, self-sufficient. As a corollary of the aim, we continued to ask questions of students, largely as the means to equip them with the elements of the interpretive process.

A seeming obstacle to student participation is the size of the class. Christianity and Culture enrolls more than eighty students, usually first-semester freshmen. At the first class meeting, we modify the traditional arrangement of desks in the classroom. Ranks and columns give way to semicircles, each composed of seven or eight desks. Approximately ten such groups are deployed to afford all students an unobstructed view of the screen (when it is extended) and to enable the professors to walk through the classroom and make contact with the students. This personal contact is facilitated by a seating chart, which is composed after the small groups have been arranged, and by snapshot photos that students are requested to provide. Before the end of the third week, the professors know the students by their names.

In each of the small groups, the students come to know one another not simply because of constant visual contact but also through cooperative learning. Part of each class meeting, usually the last fifteen or twenty minutes, is set aside for small-group interaction. Each group is assigned a topic related to the class meeting. In the unit on Gothic art and architecture, for instance, one group will discuss why red and blue are the dominant colors of stained glass. Other topics include the following: the significance of rose windows, the appearance of gargoyles and their meaning in the overall conception of the cathedral, the etymology of "nave" and its function in describing the medieval outlook on the cathedral. The analysis and interpretation pursued in small groups enable students to become more self-confident and psychologically rewarded for having been attentive in the course. One student from each group will serve as a recorder-reporter, making notes and then presenting a brief oral report to the entire class. This assignment rotates at each class meeting. Since the topics discussed by small groups are directly related to the presentations by the professors, reports add considerably to the developing insights in a class meeting.

Interaction in small groups is also the means of preparation for the two examinations (mid-term and final) in the course. Approximately two weeks before each examination, we distribute a list of questions from which the test itself will be composed. Each group is assigned particular items from the list, and the reporting that they provide reflects their cooperative outlook. Such review alleviates the anxiety of students and reinforces, particularly at mid-term, the upward curve of learning by highlighting the process of interpretation.

The course also requires two papers, each approximately 1500-2000 words long. The topics on which students may write their papers are described in detail in a set of guidelines that we distribute. Each topic requires not only an integrated approach but also the process of interpretation that has been taught and practiced in class. One topic involves the typological interpretation of Scripture, particularly the Old Testament "types" of Mark's concept of the suffering Christ. Several examples are provided from which the students may choose—the confinement of Noah in the ark, the intended sacrifice of Isaac, the adversity that befalls Job. Because each course paper is to be accompanied by at least two photocopied illustrations, students will visit the library. The staff of the library, having received a copy of the assignment sheet, will assemble the most useful books and place them on a designated shelf in the Reference Room. Each photocopied illustration is to be captioned according to the guidelines that we provide. In correlating, for instance, Isaac and the suffering of Christ, students perceive resemblances between the journey toward Mt. Moriah and the "way of the cross" to Golgotha, the stack of twigs that Isaac carries and the cross borne by Christ, the sword at Abraham's side and the centurion's lance at the crucifixion, the ram sacrificed in place of Isaac and the death of Christ, the willingness of Abraham to offer his son and the Father's actual sacrifice of Christ at the crucifixion. Such typological similarities, elaborated in detail by reference to the illustrations, are illuminating indeed. Accompanying the topics and guidelines that we distribute is a one-page self-evaluation that each student completes for his or her paper. The self-evaluation involves appraisals of Superior, Good, and Average in relation to the following criteria: Content (mastery of information), Style (grammar, mechanics, expression), and Insight (understanding and interpretation). Simply by appraising themselves in relation to the three criteria, students give us a clear idea of their own sense of achievement. We then use the same criteria to appraise the students, and in cases where a student's self-evaluation differs significantly from our judgment, we request a conference. We also comment extensively on the papers, so that students are aware of the reason for our appraisal.

The courses in the University Core Curriculum undergo a double evaluation by the students, who use one instrument designed specifically for Core courses and another (called the Student Opinion of Teaching Effectiveness) for all University courses. In the statistical ratings and in the comments by the students, Christianity and Culture is ranked very high. Among the reasons cited by the students are the following:

(1) Both professors are intellectually curious—i.e., willing and eager to venture beyond the bounds of their respective disciplines;

(2) Both professors work cooperatively not competitively in the classroom, so that an overall climate of harmony prevails;

(3) Both professors are energetic in their preparation for classes and in their wholesale commitment to the course and the students;

(4) Both professors teach a process of interpretation and critical thinking at first beyond the reach of students but eventually within their grasp.

If the foregoing comments by the students were rephrased as prescriptions, there is no better formula for achieving effectiveness in an integrated course.

TELEVISION AESTHETICS AND HUMANISM

Television is certainly the most persuasive media presence in American life, and it is quite possibly the most important social and cultural force as well. Although it hardly seems necessary to cite the numerous statistics reflecting these facts, at least a few points will help us to gain perspective. For example, more than 98% of all families in the United States have at least one television set, a statistic which gains added force when we consider that fewer families have indoor plumbing. And those sets are turned on an average of over six and one half hours every day, more than sixty hours a week in homes of families with three or more members. In February, when the heaviest viewing takes place, the daily average is well over seven hours. More than half of the homes in this country have two or more television sets, and it is common in such households for family members to watch TV in isolation or in small groups, with each individual or subgroup watching separate programs at the same time. There is also the frequently noted statistic that by the time they are eighteen our children have spent far more time viewing television than they have spent in school.

Television use has become a ritualized activity in our homes. The television set usually dominates the room in which it is placed, and that room is often the central gathering spot for family interaction. When Americans move into a new home it is common for the television's location to be selected before any other item of furniture is placed. Most of us have established rigid patterns of viewing. We watch TV from the same seat, with the same lighting, and often concentrate our viewing around a pattern related to the day of the week. That is, we do not just watch television, we incorporate it into a regular pattern of daily life. Quite simply this medium is a part of our everyday activities and it is experienced within the context of those activities. We must make a conscious effort to experience other art forms—we decide to attend the theater, we drive the family to the art gallery, we set aside time to read a book, we leave home to take in a movie. But television commonly surrounds us from the early morning news we experience as we prepare for work through the late show which helps us to wind down at the end of the day. In most homes the TV seems to be turned on more than not.

All of this—the inordinate amount of time devoted to television viewing, the tendency toward the fragmentation of the family in multi-set homes, and the manner in which the medium dominates our everyday lives—has frightened both the sociologist and the humanist. But even these facts of the television age might be forgiven by many humanists if it were not for the programming. To refer to television as "art" seems a heresy to many. Hans Eichner, noted literary scholar and humanist, recently summed up the case against television programming. "There is no art," he wrote, "that can have value and dignity if it is wrapped around commercials for floor polish, laxatives, and deodorants . . . nobody except the very young and the exceptionally stupid takes TV seriously enough for it to have any effect whatever—except the effect that its remorseless triviality pre-empts, for a large segment of the population, virtually all genuine literature." Professor Eichner concludes, "The trouble with *Ironside* or *Police Woman* is not so much that these entertainments make the wrong statements, but that they make no statements at all" (pp. 85-86). Such views, of course, are not unique to Eichner. It seems safe to say that many, if not most, humanists concur.

Although prevalent, this assessment of television is erroneous and shortsighted. I think many critics of television have been looking at the medium in the wrong manner. For far too long, far too many of us—perhaps all of us—have expected too much from television art. No medium is ever able to sustain artistic intensity at peak levels indefinitely. Certainly there are second- third-, and fourth-rate television artists and television programs. As a number of observers have noted, in every week each of the four networks (I include PBS) must fill twenty-two hours of so-called "prime time". Allowing a rerun rate of fifty percent, this would still mean that a total of 2288 hours of first-run programming is required *each year*. In fact, special presentations, sporting events, pilot films, made-for-television movies, and the like quickly push the prime time total even higher.

And the networks also contribute heavily to daytime, weekend, and late night programming. To these figures we must add the endless hours of programming supplied by the independent stations and network affiliates during non-network hours, the products of the increasing number of cable suppliers such as ESPN all-sports station and Ted Turner's Cable News Network, and syndicated programming such as game shows, "Entertainment Tonight," and "PM Magazine." All in all, American television artists must develop tens of thousands of hours of new product each year. Certainly a good deal of this material can only be characterized, to use Walter Kerr's words, as "mental chewing gum."

Nevertheless, to deny an artistic and aesthetic dimension to all television programming is to throw the baby out with the bath water. There is excellent television art and inferior television art just as there are both great and mediocre plays by William Shakespeare. And we need not limit the sphere of excellence in television art to public broadcasting, an area which at least some humanists have grudgingly embraced as almost palatable. Bernard Mayes, for example, has argued that "public broadcasting is our best bet" for providing what he calls "enjoyable enlightenment" to the multitudes. He differentiates this experience from the "unenjoyable entertainment" of commercial television (p. 89).

Mayes is typical of a large number of humanists who see in the medium of television an opportunity for bringing art to the multitudes. Evidence of television's great potential has been found in such presentations as *The Ascent of Man, Civilisation, Roots, The Jewel in the Crown, The Civil War*, and others. The ambitious project to present all of Shakespeare's plays and even the occasional telecast of an opera are further evidence that public broadcasting and the humanities are beginning to form an important partnership. I, too, applaud such efforts, and I have enjoyed them. Undoubtedly thousands of our citizens have been "enjoyably enlightened" by such programming. Nevertheless many, if not most, presentations on public television have not truly spoken to or for the multitudes. While the audience is growing, public television's average ratings still lag far behind those of the commercial networks. Most people in this country devote most of their viewing time to commercial and cable television fare.

But this is not necessarily a terrible thing, for commercial television art, like all art, tends toward an aesthetic dimension, and the best of that art also tends toward a dimension of humanism. I take the humanities to be those art forms which help us to understand our relationship to our cultural heritage and to each other. The humanities seek to provide the individual with a frame of reference which helps each person to work through the great questions of life. How do we respond to the ethical and moral dilemmas posed by our value system? What is our perspective on birth and the nurturing of new life? How does death and dying provide a focal point for living? The humanities help each of us to formulate our answer to the greatest of all questions, "Who am I and what does it mean to be a human being?" I think that if we allow ourselves to look at popular television presentations we will find that this humanistic dimension is present on a surprisingly regular basis.

There are two distinct dimensions to the television aesthetic. The first involves the manipulation of the medium itself, the manner in which the creators elect to take advantage of the unique nature of television broadcasting. Although it may seem obvious, it is important to note that television is not simply film with a smaller visual field. Nor is it radio with a picture. Many critics find fault with the medium itself. Television art, after all, is confined to a small screen, the dimensions of which approach a perfect square. The audio, on most sets, is far inferior to FM radio and the sound systems now available in most motion picture theaters. The contrast and detail representation of television images are inferior to most other forms of visual communication. Finally, it is often said that television pictures lack depth and, because of their nearly square dimensions, can never give the viewer a sense of panorama.

We must remember that every medium has its parameters. The best creators in all art forms attempt to craft their productions within the boundaries imposed by the medium itself without the reference to other media. Painters working in acrylics do not look to water-colorists for guidance, nor do dramatists feel the need to imitate novelists. Similarly, the best television artists work within the technical dimensions of the medium, while those who do not understand the nature of television art commonly fail. One example of the latter was ABC's disastrous "Battlestar Galactica," a 1978 series which attempted to cash in on the "Star Wars" phenomenon. The space epic relied on spectacular special effects and featured a gargantuan spacecraft. The use of wide screen devices and conventions simply did not work on our video receivers. Enormous explosions, which would have filled a movie theater with light and excitement, popped with less effect than the tiniest of firecrackers when shown on the small screen. As for the spacecraft itself, few in the audience could appreciate its supposed enormity, and the intricate detail of the ship's exterior, while costly and time consuming to create, was totally lost on television. There are many other examples of television presentations which do not work simply because the creators were not cognizant of the dimensions of the medium.

Better television artists not only understand the supposed limitations of the medium but are able to fully transcend them and even turn them into their own advantage. For example, the size of television screens places emphasis on close shots and dialogue. Moreover, the close shot on the home screen provides an image which is near to life size, and this in turn heightens and takes advantage of the intimacy of the medium. Horace Newcomb, a noted and sympathetic critic of television art, suggests that the audience becomes highly attuned to *reaction* as opposed to action (pp. 245-248). That is, we are able to view the characters' faces as they interact with each other and react to that interaction. This focus on dialogue and reaction commonly dominates soap operas, but I believe it is a strength in all of the better television presentations.

But even the spatial limitations of the television screen do not inhibit the better artists. For example, episodes of "Little House on the Prairie," which were directed by Michael Landon, were often filmed so as to provide the audience with a feel for both intimacy and distance, both confined space and unconfined space. A frequent visual convention in the series was the distant shot of two people conversing. This is an unusual shot and is infrequently used in television. In such shots the audience could not see the actors' faces in detail, and it was sometimes impossible to tell even if their mouths were moving. The audience was, however, given a full audio account of what was transpiring.

Rather than focusing on the actions and reactions embodied in the faces of the actors as they delivered their lines, Landon used the camera to treat the audience to a distant vision of the actors' bodies as they related to the setting and action of the scene. We viewed them unloading a wagon, walking across a bridge, or eating a picnic lunch beside a distant tree. A pair of performers was sometimes set off in a crowd, or they sometimes conversed in an isolated setting. In such instances the audience gained a visual representation of the characters' relationship to each other and to their environment which is rarely seen on television. To be sure, Landon frequently utilized close shots, and, like most television artists, he often placed his action within confined spaces such as the family home, the school, or the community store. But he was not bound by these conventions, and "Little House on the Prairie" illustrated that television art can break away from the confined settings which too often dominate commercial productions.

Another series which continually stretched the technical dimension of television art was "M*A*S*H," a production of consistent high quality which was appreciated even by some of television's most outspoken critics. A few examples of the producers' inventiveness indicate that television productions need not be tyrannized by the physical nature of the medium. Now that most American homes have color television, it is almost forbidden to fill prime time hours with black-and-white programming. Nevertheless, to achieve the effect of an early 1950s newsreel one episode of "M*A*S*H" was filmed entirely in black-and-white. Another segment of the series was filmed from the point of view of one of the wounded soldiers. The man was confined to a wheelchair, and the camera was lowered accordingly. Cpl. Max Klinger and others wheeled the man from one side of the camp to the other, and the audience was most effectively placed in the wounded soldier's shoes. In this instance the limited visual field of television art was used both uniquely and forcefully to allow the audience to assume the perspective of the injured man. We could almost feel ourselves in his wheelchair, and we could certainly begin to appreciate his sense of helplessness.

Another of television's supposed technical limitations relates to the time frame within which programming must fit. A half-hour commercial program such as "M*A*S*H" has only about twenty-four minutes to tell a story. All narrative art forms have the ability to expand and contract time, and television is no exception. Theoretically a twenty-four minute episode could depict and chronicle any given time period. However, many television creators become bound by a convention of time which limits the period covered in any specific episode to a fairly standard framework consisting of a few hours to as much as a few days. The producers of "M*A*S*H" used this convention on numerous occasions, but they were also far more creative. In one episode the series depicted the events of an entire year. In another, a twenty-four hour day was convincingly chronicled, while still another program represented a typical week with the 4077th.

The finest example, however, was a gripping episode which was tied to "real time." That is, the period over which the story unfolded was *exactly* the same as the period in which the episode was shown. Briefly, surgeon Hawkeye Pierce discovered during the first minutes of the program that he had only about twenty minutes more to perform a delicate operation in order to save a patient's life. A clock was suddenly superimposed in the lower corner of the television screen, and it proceeded to tick off the seconds and minutes so that the viewers could keep track of the desperate situation in which Hawkeye found himself. Even commercials offered no respite, for the clock within the program was adjusted so that the time lost to commercials was also lost to the surgeon. The audience could feel and understand the desperate nature of

1543

Hawkeye's plight with an intensity often missing from other forms of dramatic art. The impact of this episode was understandably enormous. Were it not for the restrictions of television art this program might never have worked to such a profound effect.

It is certainly possible to take all of the aforementioned "limitations" of television art and several others I have not discussed and turn them into artistic advantages. This is one measure of the aesthetic accomplishment achieved by television producers. Again, the best television artists fully understand the nature of their medium and they manipulate it successfully and with creativity. Certainly many television critics must pay more attention to this interaction between artist and medium. I believe that many of those who denigrate television as an art form would be rather taken aback by careful study of the manner in which the best of the video artists utilize the medium itself. Sometimes the technical dimensions of the television aesthetic are handled in remarkable fashion.

The second dimension of the television aesthetic is of even more importance to the humanist. This is what Horace Newcomb calls the "organic" dimension of television and it is readily apparent in commercial television's most distinctive format, the continuing series (pp.243ff). Television must be viewed as an art form which continually grows, builds upon itself, changes and evolves. Even when individual episodes of a series seem discrete and unrelated to other episodes, the audience is familiar with the genre, the series, the characters, and the general situation to such a degree that they accept a certain "probability" of action. Characters and interactions are not "predictable," only probable. In the more fully developed series, of course, this connectedness is explicit and well drawn. We have viewed the inner growth of such characters as Edith Bunker, Mary Richards, Col. Sherman Potter, and even Arthur Fonzarelli. We mourned the deaths of Edith, Grandpa Walton, Col. Henry Blake, and more recently "Sesame Street's" Mr. Hooper. We watched Archie Bunker's bigotry mellow with the passing years. We were able to see Ann Romano grow from a newly divorced and insecure woman into a mature, strong, and self-confident partner in a major business firm.

All of these developments demanded audience understanding of the evolving nature of the series in which they occurred. Our familiarity with the characters grows over the years as we continue to follow our favorite programs. The best series exploit this factor and help the audience to identify with the characters. This identification, coupled with the internal dramatic evolution, makes it possible for the audience to approach life's great problems along with the characters. We place ourselves in their shoes as they grapple with their relationships, their fears, their tragedies and triumphs. We predict how they will act based on their past experiences and actions. We are familiar with these characters' histories, and we come to understand their emotions and values in a way which is nearly impossible in most other forms of art, for we have the privilege of watching the characters' lives unfold over a considerable period of time. In short, television's organic dimension, when properly used, provides a significant and widely available outlet for humanistic art.

Perhaps this organic dimension of television art is best described through the use of Raymond Williams' concept of "flow." In his *Television: Technology and Cultural Form* Williams argues that no individual television presentation stands in isolation. Instead, each program assumes a part in the total television mosaic as it acts and reacts with the programming both before and after. The art of television, then, flows from one event to the next, each part interacting with the others. Moreover, as mentioned above, the tendency of a good deal of television art to be locked into the continuing series format dictates that television's past flows into the present. The critics of television art have shown a disturbing tendency to want to separate each individual segment out of the whole. This makes for easy analysis, but, unfortunately, it completely discounts the manner in which the audience approaches television art. Thus, many critics miss television's considerable potential for the presentation of humanistic art.

"THE ARTS IN NEW YORK CITY": EXPERIENCING THE ARTS LIVE

"This was my first chamber music performance but I know now that it won't be my last." (Urban Studies student)

"The opera was wonderful! I never in a million years thought I would like opera. . ." (Communications student)

"When I first saw [the play] I didn't really enjoy it. But the more I explored and analyzed the characters and their relationships, the more I appreciated and understood the show." (Art student)

"The Arts in New York City class . . . opened my eyes to different art forms that I had never had the opportunity . . . to examine. Never before did I understand or feel the aesthetic value of the opera, ballet, modern dance, or museums . . . I realize now that art is not an esoteric subject only for the knowledgeable, rich, or famous." (Political Science student)

One of the primary challenges that teachers of arts appreciation courses face is that of conveying to their students the excitement brought about by first-hand encounters with the arts through the removed and much less satisfying media of textbooks, photographs, and classroom discussion; even video and audio reproductions lack the immediacy and depth of "the real thing." At Hunter College we have designed an interdisciplinary humanities course called "The Arts in New York City," which combines classroom lectures and discussion periods with attendance at a variety of our city's arts events and museums. Through this course, students are introduced to both traditional and avant-garde art exhibitions and performances directly in the concert halls, theaters, museums and galleries of New York.

Our course grew out of Hunter's Junior Year in New York Program, started in

1982, now part of the National Student Exchange (NSE) Program, which offers students from around the United States the opportunity to study in New York for a year while continuing their work toward an undergraduate degree in the liberal arts. Though a series of arts events has always been a feature of this program, in 1987 we first offered an official college course designed around attendance at Broadway and Off-Broadway shows, concerts, and other performance pieces. It is our belief that although mere exposure to the arts is a powerful incentive toward future cultural experiences, the educational opportunity afforded by such a series of events justifies—in fact, fairly begs for—a classroom component. In the classroom students would be able to prepare ahead of time for the upcoming events, gathering information and gaining perspective, and would also have the opportunity to verbalize, weigh, and refine their reactions afterward.

While the abundance of artistic activity in New York guarantees that there is never any difficulty in filling our schedule—the problem is, rather, in narrowing the selection—such a course could be instituted in *any* community, including a college community, large enough to support a variety of arts. In choosing the events that comprise the seminal texts of this course, we have kept in mind the value of exploring a diversity of expression in a variety of media and cultural contexts. The course introduces students to art forms and aesthetic experiences they may not —often would not—have chosen for themselves, but which they frequently, to their amazement, find themselves enjoying. For many American students the opera is representative of this unfamiliar aesthetic territory, and it is in this "assignment" that the contrast between student expectations and the subsequent response is the most pronounced. Many of our students described their anticipation of a night at the New York City Opera in terms of dread: they were worried that they would be bored, would fall asleep, would not be able to stand the "high-pitched, shrieking" voices, etc. After a preparatory class in which a guest lecturer, one of Hunter's music professors, listed, among other things, what one should and should not expect from opera, and discussed frankly some of the reasons opera is not a popular art form in America, these same students came out of the performance—a first for most of them—having developed a new, and for some of them, a very surprising appreciation for the form. Although we do not advocate that it is necessary or important for everyone to enjoy opera, or any of the events attended, we do want students to be able to decide for themselves whether they do or not based on at least one well-prepared encounter with a professional production, rather than submitting to a vague and inarticulate prejudice against "highbrow" cultural activities in general. The omission of events such as rock concerts, films, or television productions from our course syllabus, on the other hand, does not imply that we do not view these as "cultural" or artistic activities, only that they are art forms with which our students are already quite familiar. It is our purpose to use the familiar context of a course structure to help students broaden their aesthetic horizons and to hone their critical skills in such a way that they will become more perceptive observers of whatever art forms, whether "high" or "low," popular or traditional, they are exposed to in the future.

We decided to arrange our course such that attendance at the performances and museums would take place during the times regular classes were scheduled (extending past the end of the regular class-time in most cases), rather than assign students to go on their own. They pay a set fee that covers all expenses for the semester when they enroll in the course, and we handle the reservations and purchase tickets for them. This arrangement ensures that the whole class sees the production together, so that the students can observe and analyze the particulars that make each performance an individual artwork. It also allows us to take advantage of group or educational discounts. In many cases, arts organizations are also willing to make special arrangements for educational groups who wish to stay after performances for question-and-answer periods with the artists or producers of a show, often at no extra cost.

At the same time, scheduling the events as classes demonstrates that the university views arts performances and museum exhibitions as educational activities in a strict and crucial sense. The arts community is shown to be integrally connected to the college community, the former providing the texts, the latter providing the perceptual preparation and analytical judgment to appreciate them. Students learn that the artworks that fill the syllabi of many of their classes are enduring examples of ever-developing forms and sensibilities, that "classics" were once, and still are, contemporary. Which of the contemporary works they have seen will become classic? The students come to understand that such determinations are theirs to make, and to take seriously.

Prior to each scheduled event, the class is given a set of critical readings: often a set consists of newspaper or magazine reviews, interviews or feature articles concerning the performance or exhibition we will be seeing; sometimes the readings are more abstract or analytical. One year we made use of a textbook, *Explorations in the Arts*, to provide students with a more thorough theoretical foundation.

In addition, pre-event lectures help to prepare the students for what they are about to experience. Because of the interdisciplinary nature of the course, we draw upon faculty from several different departments to introduce students to the works they will be seeing. The teacher of a course like this one must have a comprehensive interest in and familiarity with the arts overall, but cannot, of course, be expected to speak as an authority on all of them. The Dean of our Division of Humanities and the Arts helped us here by recruiting faculty members to donate their time and expertise as guest lecturers. In addition, on a couple of occasions we called in outside speakers—an arts critic for *New York Newsday* and a Hindu scholar contextualized Peter Brook's *Mahabharata* for our students; a former member of the Alvin Ailey Dance troupe informed them about the history of that company; a former Hunter student who helped produce the black South African musical *Sarafina!* in New York gave the class valuable background on the struggle that made up the subject of the show, and of which the show itself became a part. These preparatory lectures give students an inside, "backstage" view of the arts, helping them to appreciate the labor that goes into a production and to understand the intelligence that shapes that labor.

A pedagogic challenge is presented in arranging the series of events in a cohesive, interrelated syllabus so that students gain not only a better appreciation of the specific artwork they have seen with the class, but also begin to develop an understanding of genre, theme, and the cultural and historical contexts out of which specific works have evolved and continue to evolve. It is preferable, for example, if one is introducing students to the dance, to take them first to see a ballet and then to a modern dance performance, since modern dance grew out of the ballet and developed in large measure in response and reaction to it. This is not always possible to do, however, depending upon the arts calendar that is available to the teacher planning the semester.

The teacher should, nonetheless, help students to draw connections and note disconnections among the various performances attended. Some works obviously lend themselves more readily to comparison and contrast than others. Still, the possibilities for comparison and contrast between any two artistic works is nearly inexhaustible and should not present a problem to any but the most literal-minded teacher. We found that common themes emerged as our calendar took shape: one year many of the works we studied explored themes of fantasy/reality (Mozart's *The Magic Flute*, Terrence McNally's *Frankie and Johnny in the Claire de Lune*, Stephen Sondheim's *Into the Woods*, Lee Breuer's post-modern extravaganza *The Warrior Ant*, and the Joffrey Ballet's *Nutcracker*). (It should be noted that the events were chosen first out of the desire to "cover the genres," and the themes surfaced as we developed the calendar of events.) Another year, issues and expressions of race and ethnicity were apparent in many of the works when we went to see the American Indian Dance Theatre, the Dance Theatre of Harlem, the opera *Madame Butterfly*, and Henry David Hwang's exploration of the opera's themes in his drama, *M. Butterfly*. In the fall of 1990 we chose to focus our class discussions on general issues of funding in the arts, obscenity and censorship, and some of the related controversies currently shaking up the art world, which gave the course a strong political and social dimension; during this semester we attended a monologue by Holly Hughes, one of four performance artists who lost NEA funding in the controversy.

We try to begin each semester with the more traditional arts -- arts so well-established that some students may think of them as monumental relics of the past which have little to say to them. After they have been exposed to these classical forms, become somewhat familiar with the language of criticism, and developed an understanding of how technique, sensibility, and culture work together to create any artistic work, they are better prepared to approach the avant-garde, which confronts them with consciously *non*-traditional works. In the beginning of the course, journal remarks (we require the students to keep a journal of their responses to the events) often reflect simple surprise that preconceptions of "what I like" have been overcome; later in the semester, students are able to recognize and enjoy the very experience of being unsettled by a work of art that is new and sometimes even upsettingly confrontational. After attending a performance art piece by Douglas Kenny at the Franklin Furnace, an avant-garde performance space, one student wrote in his journal ". . . my curiosity was bubbling with a desire to find out what was going to happen next . . . my eyes and ears took in so much variety and strangeness that at the end I wasn't sure if what I'd just experienced was real or not . . . It may have been a little 'weird', but it was worth it." It is satisfying to see how quickly students can become comfortable in uncomfortable cultural settings once the confounding of their prejudices has taught them to maintain an open mind in the face of new experiences, whether at the opera or in the basement of the Franklin Furnace.

Besides keeping the journal, students are required to write three papers: one a "compare and contrast" paper to be written on any two of the works studied; one an in-depth analysis of a single element (thematic or technical) in one of the works, and one a critical review. Since some students in our program are themselves studying to be artists—the program, being based in New York, draws a number of such students—we offered them the choice of presenting a creative work of their own instead of writing the final paper. These presentations were made to the class in the final meeting of the semester and were very successful, especially since the "audience" was so well-prepared, open to new artistic experiences, and aware of the work that goes into creating one.

We believe that the direct experience of the arts provided through this course is not only extremely beneficial to students, but also contributes to the arts community by helping to develop enlightened new audience members. This has been borne out by comments the students have made in evaluations at the end of the course. Students in the social sciences gained as much, if not more, than our arts students, since for many of them an immersion in the world of the arts was a completely new experience. But no one said it better than one Communications student, who wrote in her evaluation, "This course has given me the opportunity to discover a world that was virtually unknown to me . . . The reason I didn't go to see plays, and the other arts . . . was simply due to the fact that I didn't 'know how' to go about doing them, silly as that sounds . . . Because of what I've learned in this class I am able to think more critically about what I am viewing instead of just being entertained . . . It has been an experience that goes far beyond a grade or a couple of credits; it is something that I will remember for the rest of my life!"

HUM 150.53*, FALL 1990
SCHEDULE OF EVENTS

Wednesday, August 29	8:00 p.m.	JEROME ROBBINS' BROADWAY Imperial Theatre 249 W. 45th, betw. Bdwy & 8th
Tuesday, September 4	4:10-5:25 p.m.	FIRST CLASS MEETING 415 Hunter West

"What's obscene, what's offensive, and so what?"

Thursday, September 13	7:30 p.m.	BARGEMUSIC
Sunday, September 16	4:00 p.m.	Chambermusic (Trio: violin, cello, piano) Music by Mozart, Beethoven, Smetana. Fulton Ferry Landing, Brooklyn

[Half the group will go to the concert on Thursday evening, and half on Sunday afternoon.]

Tuesday, September 25		NEW YORK CITY OPERA "La Bohème" at Lincoln Center New York State Theatre 65th and Broadway
	6:30 p.m.	Pre-opera lecture Bridget Paolucci, speaker Rehearsal room, New York State Theatre (Enter at stage entrance, 62nd and Columbus, and ask guard for directions)
	8:00 p.m.	Opera begins
Tuesday, October 2	4:10 - 5:25 p.m.	CLASS MEETING Hunter West 415

"Who should pay for the arts, and what should they get for their money?"

Friday, October 12	6:00 - 7:30 p.m.	Lecture tour of MUSEUM OF MODERN ART with Gary Faigin Meet at security entrance (Museum will be closed to public.) 18 W. 54th St.
Friday, October 19	8:00 p.m.	HOLLY HUGHES "World Without End" P.S. 122 150 First Avenue
Tuesday, October 23	4:10 - 5:25 p.m.	CLASS MEETING Hunter West 415

"Why have arts anyway?"

Tuesday, October 23	8:00 p.m.	THE PIANO LESSON by August Wilson Walter Kerr Theatre 219 W. 48th Street
Tuesday, October 30	7:30 p.m.	NEW YORK PHILHARMONIC Lincoln Center Avery Fisher Hall Erich Leinsdorf, conductor Alicia de Larrocha, pianist Music by Wagner/Mozart/Falla/Ravel

*HUM 150.53 is a one-credit version of the course described in the preceding article; HUM 250.53 is a 3-credit course in which class meetings are held every week of the semester, and three papers are assigned.

Friday, November 9	8:00 p.m.	BILL T. JONES "Last Supper at Uncle Tom's Cabin" BAM Opera House 30 Lafayette Avenue, Brooklyn
Tuesday, November 20	4:10 - 5:25 p.m.	CLASS MEETING Hunter West 415
"Does talent excuse evil? Do good intentions excuse bad art?"		
		FIRST DRAFT OF PAPER DUE or WRITTEN DESCRIPTION OF PERFORMANCE/ PRESENTATION
Tuesday, November 27	7:30 p.m.	THE NUTCRACKER Joffrey Ballet City Center West 55th Street between 6th and 7th
Tuesday, December 4	4:10 - 5:25 p.m.	CLASS MEETING Hunter West 415
"Is nothing sacred?"		
Tuesday, December 4	8:00 p.m.	BALLET HISPANICO Joyce Theatre 175 Eighth Avenue (19th Street)
Tuesday, December 11	7:30 p.m. - ???	FINAL CLASS Presentations & Party West 217 FINAL PAPERS DUE

Events have been scheduled on Tuesday and Friday evenings wherever possible, so leave those evenings free of other commitments.

The class will meet six times over the course of the semester. Attendance at all performances, as well as at class meetings, is expected. Five of the class meetings will be held during Dean's Hours on Tuesdays, 4:10 - 5:25 p.m. in Room 415 Hunter West. The last class meeting will begin at 7:30 p.m. (in Room 509 West).

Assignments will include the keeping of a journal, three written statements and three written questions on each event attended, and one five-ten page paper on one of the following topics:

1)Define and support standards of censorship of the arts.

2)Argue in opposition to the idea of censorship of the arts.

3)Under what terms should the government financially support the arts, or shouldn't they?

A first draft of the paper is due on **November 20**. Drafts will be returned, with comments, after the Thanksgiving holiday. The final paper is due **December 11.**

Students who wish to may substitute a performance or presentation of an original creative work, to be presented in the final class meeting on December 11.

In addition, there will be assigned readings from newspaper and magazine articles.

Donald Metz

A COMPROMISE APPROACH TO THE RELATED ARTS

"The great end of art is to strike the imagination . . ." Sir Joshua Reynolds

Within the proceedings of the international seminar entitled "Interdisciplinarity in General Education with Special Regard to Integrated Aesthetic Education" (May 1984, Hungary), one passage garnered immediate attention: "the question is no longer whether integration is necessary, but how it can be brought about." Divergent schemes and methodologies were suggested with all the anticipated problems and cautions. György Poszler (Loránd Univ.) pointed out that there are similarities as well as "irreducible differences among the art forms with respect to their historical development, character, perception, and creation. The uniqueness of the aesthetic qualities of each form demands a multiplicity of aesthetic methods of integration." Further, Gunther Otto (Hamburg Univ.) suggested that "function may be the most promising concept for integration, and that "interdisciplinarity in aesthetic education is . . . more a matter of method than it is of content." These theories in arts interrelationships were buffered by some conclusions drawn by Eileen Adams of Great Britain. "Reminding the audience (and citing Robert Frost) that 'good fences make good neighbors', she emphasized that while integration should be given serious and proper attention, it should be understood to mean that the disciplines interact when it is appropriate—especially in the solution of problems each cannot tackle alone—but that for some of the time they may merely coexist as friendly and mutually supportive neighbors."

This view is familiar to many as it is so reminiscent of the "separate but equal" attitude espoused by Bennett Reimer and others. He anticipates a time somewhere in the future when we shall transform our separate classes in art, music, poetry, and dance into broader based, all-embracing experiences in aesthetic education. His continual plea has been to avoid the superficial quickfix approaches in combining the arts, and especially "using nonartistic principles to organize the program to give an impression of unity." There can be little doubt that the most easily defended, most intra-artistic scheme for combining the arts is along the lines of artistic principles (what Reimer calls "elements") and other dimensions common to all the arts. Repetition, contrast, balance, variation, tension/release, stasis/activity and other broad principles can be examined in all the arts without fear of misrepresentation. While there are other areas of concepts that could be included here, large principles ultimately art as a framework within which we can safely proceed to compare and contrast the arts. This plan would allow us to select examples from any historical period, by any artist, and from any geographical or cultural source, for the unifying factor—the principles themselves—would remain constant. Further, this approach has obvious implication for multicultural application, a concern in all facets of education today.

And yet for all the simplicity and easy applicability of this approach, it can become impersonal and mechanical. To spend six weeks (as Reimer suggests) dealing just with repetition in the arts seems tedious. Surely, the arts can be subjected to the analytic microscope and neatly dissected; surely we can locate the repetition of note patterns, geometric shapes, color schemes, balletic gestures, and poetic phrases. But having done that, we still have no assurance that such an approach will touch the hearts and imaginations of our students. If Poszler is correct in recommending multiple approaches to the problem of combining the arts, then we need to include as part of our program something more than artistic principles alone, as fundamental as they are.

Absolute expressionists argue forcefully about directing the primary focus of aesthetic education on the "discussible" aspects of the arts, emphasizing the "feelingful" reaction that should go hand in glove with perception, and consciously avoiding the trap of interpreting the personal, human aspects of art works. It is clear that teachers who attempt to explain how Beethoven was feeling the day he wrote a particular sonata are comparable to litigants who act as their own lawyers. Nonetheless, what always is missing in the various curricula suggested for aesthetic education is the inclusion (not exclusively, but as provocative episodes) of those themes that are more personally compelling to our students, themes such as love, death, war, contemporary life, loneliness, etc.

The importance and power of incorporating the subjective, personal response to broad themes came to mind on reading a selection from a remarkable publication from the Tate Gallery. *With a Poet's Eye,* edited by Pat Adams and its companion *Voices in the Gallery* (Danny Abse, ed.), presents some winning entries in a poetry competition held in 1985 which provided amatuer and professional writers alike the chance to react through poetry to specific works hanging in the Tate. The results are thought provoking and refreshing, and one poetic "interpretation" seemed much to the point of this discussion. John Wain's poem in response to viewing Turner's *The Shipwreck* conveys his intensely personal reaction to the plight of the ill-fated passengers amid Nature's fury, and concludes with:

> Oh, it has "painterly values" too, and can be discussed in purely abstract terms: but not now, not now. Some other time, not in the presence of the human creatures, air-breathers, gulping their last, and the sea's roaring that never will be quenched, and beyond, the starfish at his supine vigil on the final beach whose shingle we shall be.

The idea of postponing consideration of both formal elements and identification of artistic principles here seems an appropriate signal that this picture speaks powerfully of human disaster and futility, well beyond any specific aesthetic and artistic concerns. The loss of life transcends such discussion, and it is precisely this immediately sensed drama that captures our attention.

From a historic perspective, we know that Turner opened his own gallery on Harley Street in 1804. As Diana Hirsch relates:

> "Among the works on display was *The Shipwreck* (1805), Turner's first major essay in Romanticism. The theme was of vital interest to a seafaring people—some 5000 Englishmen perished in maritime disasters every year—and it was also high in the Romantic's catalogue of sublime horrors, the epitome of man's helplessness against nature. The painting was Turner's most powerful yet, linking sea, sky, and victims in a triumph of turbulence incarnate.

Now if we select and allow pictures like this to speak to young viewers first, without dissection, and only later add historic footnotes and critical interpretation and explore the artistic properties and sensuous elements, have we not provided them some tools and insights that should help steer and shape their developing aesthetic experience?

And could we not follow Turner's great seascape with Philippe Loutherbourg's *Shipwreck* (1793) to compare and contrast? And then posit the ways and means used by painters to achieve their ends against the manner in which poetry—say, "The Brave Old Ship, the Orient" by Robert Lowell—describes such a tragedy at sea? The purpose of themes, used here as motivators or attention getters, is simply to help select content that has both broad appeal to students and, at the same time, that provides a series of common topics or bases. Rather than trying to show something patently false, such as the arts all do what they do in the same way, the inclusion of paintings, poetry, and even something from *Peter Grimes* by Benjamin Britten or Frank Bridge's *The Sea* should point up the difference between and among the arts. Rather than suppressing the uniqueness of each art, using appealing themes as a unifying approach to content should allow students to explore just how uniquely each art treats each theme. Comparisons could follow the general suggestions made by Leonard Meyer where he suggests matching music and visual arts in terms of formal structure; music and literature in terms of syntactical processes; and literature and visual arts in terms of subject matter.

Countless articles from the past suggest that themes and topics make reasonable unifying elements for allied arts lessons. And an equal number of disputations can be found that poke holes in these kinds of approaches. To select only themes/topics as organizers, to the exclusion of any purely artistic slant, limits the program content to art works that are rampantly programmatic, at least on the surface. To deal only with artistic "interpretations" of love, war, freedom, and the like would preclude the use of the bulk of abstract art, almost all sculpture, and every bit of absolute music (that is, without program or extra-musical title).

It is obvious that a broader general scheme is needed, one that can absorb and study the full range of artistic examples from around the world and from all epochs. And yet, themes can be useful as motivators bringing together well-chosen art examples from various realms that interpret or confront ideas of timeless and perhaps world-wide interest. Such themes are part of our daily existence, and students today are more likely to become absorbed in artistic experiences that deal with alienation or conflict or love, than they will with repetition or balance. The key here, as in every episode with the several arts is not to equate one art form with a different art form, or to attempt to choose which example does the "best" job at conveying some idea or emotion: the key is to use the themes to help select content and to keep the distinctiveness of the arts clear cut. There is a widespread but erroneous impression that the thematic approach is one that by definition tries to borrow vocabulary and elements and make valiant attempts to pretend that the arts are all very much alike. That need not be the case, and it is certainly not the definition suggested here. But carefully selected topics can help classes focus on overriding human concerns as they are reflected in the arts, and the teacher's job is to help point out the enormous differences between the arts along the way, and to show that each art deals with such themes in unique ways and means. Reimer suggests as an objective for an arts curriculum that it "improve each student's ability to respond affectively to works of art." As teachers are implored by him to remind the pupils to "respond with the heart as well as the head," then it is submitted that potent universal themes can work to our advantage and provide a portion of the multiplicity of approach Poszler spoke of.

The essential point to be made here is that themes or topics of global scope or presence need not be viewed as disdainfully as writers seem to want to do. If we are to capture the interest and heart of the student (which seems of more immediate concern than the head) we must deal with the reality that pupils today are media saturated. They expect visual images to fix attention and interest quickly, as commercials do. They expect what Meyer would term "immediate gratification" in their musical listening. They find elegant or graceful English usage difficult and needlessly heavy. Confronting such attitudes is a challenge to any teacher, especially if that teacher is to include several arts in one lesson.

To approach the arts *only* from the somewhat disembodied scheme of artistic elements and principles may fail to capitalize on the immediate appeal to students of artists' interpretations or reactions to universal themes. One need not study *first* all the painterly techniques of line, color, texture, mass, volume, and perspective before being able to grasp something of the terror in, say, *The Shipwreck*.

Yes, any art work regardless of genre should be studied at some point along the lines of elements and principles, but one should not omit the human factor, the riveting magnetism afforded by paintings, sculpture, poetry, and music that give us insight into the artist's world of feeling and sensitivity. By organizing our allied arts presentations around umbrella-like themes, we enable our content to range far and wide to include a variety of artistic interpretations from various ages and lands. While our selection may be based on broad human concerns, our exploration and investigation of each art can remain intra-genre and intra-artistic.

TELECTRONIC LEARNING

Imagine... -- John Lennon

After listening to an article about the novel in the on-line hypermedia encyclopedia, you decide to read (or reread) Mark Twain's classic, *The Adventures of Huckleberry Finn*. Select the "text" icon for an annotated version of the 1884 edition, illustrated by E. W. Kemble.

Twain's text surrounds you. Read on or travel "through" any word or phrase to access hypermedia databases on that word or idea.

Karl Gerhardt's bust of Twain appears in the upper left corner. You may wish to pick up and examine the 3-D bust. Drop it and out floods hypermedia biographical options which included, among other resources,

> —Everett Emerson's *The Authentic Mark Twain: A Literary Biography of Samuel L. Clemens*;
>
> —an audio-visual bibliography-gateway to the annotated hypertexts of Twain's other works and commentaries like Minnie Brashear's *The Art, Humor, and Humanity of Mark Twain*, and video excerpts from Hal Holbrook's Mark Twain one-way show;
>
> —scholarship on the Clemens' canon including today's work, like Joseph Gordon's 1991 Ph. D. dissertation, *A Comparison of the Social and Political Thought of Mark Twain and Henry Adams*;
>
> and
>
> —interactive-video discussion of particular texts and themes with some of America's finest Twain scholars, along with enthusiastic readers and ardent civil rights and anti-discrimination groups who label *Huck Finn* "unwholesome" and "racist."

Returning to the text, the second Kemble sketch gives you a "picture" of Huck. But how else has Tom's pal been pictured? Pick up and remove any of the Kemble sketches from the text to see the depth and diversity of Huck's images, in print and in the movies:

> —scenes from David O. Selsnick's 1938 film *The Adventures of Tom Sawyer* (with Tommy Kelly as Tom and Jackie Morgan as Huck),
>
> —scenes from the 1939 *Adventures of Huck Finn* (with Mickey Rooney in the title role), and

1561

—scenes from the 1985 American Playhouse Performance of *The Adventures of Huckleberry Finn Finn* (featuring Miss Lillian Gish).

This information is in turn a seque to an audio-visual comparison/contrast of the acting careers of Jackie Morgan, Mickey Rooney and Hal Holbrook, embedded within a history of cinema *a la* Lillian Gish.

After returning to the primary text and reading more of Twain's *Huck Finn*, you may want to use the VR Paint & Re-Create option to animate your visual description of Huck in relation to Twain's textual characterization and Kemble's visualization. You can create *your* image of Huck from scratch, or by appropriating digital bits and bytes from any of the images previously screened. You might also want to write a hypermedia *composition* to accompany your visual analysis of Huck's characterization.

Interacting with characters. Change the Widow's or Miss Watson's clothing to initiate an interactive-video discussion with Twain and his characters about their common Southern experience. Alternatively, focusing on the book Widow Douglas is reading to Huck in the "Learning About Moses and the 'Bulrushes'" sketch initiates a critical video discussion (with hypermedia summarizations and textual references) of the Moses-motif in fact and fiction, in *Huck Finn* and Twain's other works.

* * * * *

No, this is not some English teacher's techno-phantasy. It is a few moments in the *Telectronic Library* scheduled to go on-line in the next few years.

The resources of the *Telectronic Library*, which integrate the latest advances in interactive videodisc, CD ROM, CD ROM XA and "virtual reality" technologies, are used by students taking Disk-Courses from the comfort of their own homes, using their PC, MAC or 16-bit CD home entertainment system. When on campus, they can stop into the Electronic Learning Environment for a more visceral version of last night's lessons.

It's easy to see the education value of *Telectronic* learning. And it's just as easy to find "areas for concern."

Currently, when a student is sitting in the dorm room studying *Huck Finn*, she or he may or may not have someone with whom to discuss themes, or ask about the critical history of the novel, or biographical questions about Twain, or the setting of the novel (circa 1835-1845). The student has only the text, and whatever library books were checked out in anticipation of questions and curiosities not yet formulated.

If, while reading and studying *Huck Finn* and those other printed texts, the learner comes across some idea, reference or intriguing detail and wants more information about it, getting it means interrupting the train of thought, trekking to the library, finding the needed texts, reading them there and taking notes, or photocopying the material (provided the student remembered money, has enough to get everything needed, and the copying machine isn't "out of order"), trekking back to the dorm, and trying to re-enter the state-of-mind that prompted the research excursion in the first place.

But what of face-to-face interpersonal communication, group dynamics and socialization? Won't they be lost? Personality clashes and poor group dynamics can impede classroom learning, but aren't they intricate to the overall education process?

We invite you to explore these and other questions as a participant in the *Telectronic Project*.

HUMANITIES EDUCATION ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

ART TEXTS

Taylor, Joshua C. (Editor). *Nineteenth-Century Theories of Art.* (*California Studies in the History of Art*, No. 24.) Berkeley and Los Angeles: University of California Press, 1987. 56 illustrations, index, xii + 563 pp. $40.00. Paperback, 1989. $12.95. Reviewed by Roger Johnson, Jr., University of Southern Mississippi.

The late Joshua C. Taylor is remembered as a teacher, administrator, and historian. His meticulous scholarship was always enhanced by a generous measure of common sense and a keen eye. The book reviewed here is further witness to his abilities and dedication. It owes its realization to James L. Yarnall, who, under the aegis of the National Museum of American Art, Smithsonian Institution, assembled Taylor's manuscript and notes, completed some introductory material ("based on Taylor's notes"), and saw the book through publication. Students of humanities and art history owe James Yarnall a debt of gratitude for a job well done.

Taylor grouped the forty-seven selections of the volume in six sections: "Beauty and the Language of Form" (with, for example, writings by Reynolds, Gilpin, and Ingres); "Art and the Community of Souls" (with selections from Wackenroder, Blake, Minardi, Baudelaire, and others); "Truth to Nature and the Nature of Truth" (with Emerson, Ruskin, Corot, Thoré, Courbet, and others); "Art and Society" (including Taine and Proudhon); "An Art of Pure Vision" (with Zola, Fénélon, and others); and "Arts as Creation" (with, for example, Imbriana, Whistler, and Kahn). Each section has an introductory essay in which Taylor addresses the rationale of the grouping, explains concepts and vocabulary, and makes initial connections among the theorists. Each individual selection is prefaced by a short biographical sketch that includes bibliographical information and, usually, an evaluative summary of the theorist's argument. Footnotes by Taylor provide information of a factual nature and a few cross-references. Taylor himself translated a number of the selections from French and Italian and recruited translators for German material that did not yet exist in an English version that satisfied him.

The collection is astonishingly rich. As Yarnall points out in his preface, Taylor had a fondness for texts from the late eighteenth and early nineteenth centuries. Indeed, beginning with an excerpt from Reynolds' *Discourses on Art* (1771) makes good sense for an anthology in which the selections return again and again to the grand topics of the nineteenth century: invention, truth, use of color, sincerity, academic disciplines and individual creativity, ideal beauty, imagination, historical precedence and myth, science, the role of the artist in society, genius, and, above all, nature. Reynolds' comments, together with the subsequent selection from Francesco Milizia on the art of seeing (1781), make a splendid jumping-off point.

For example, it is fine to have, in one volume and in context, Valenciennes's 1800 remark on ideal beauty and Zola's 1867 contrary statement. The former wrote: "All artists are convinced that there exists in Nature an Ideal Beauty which the Greeks knew so well and which they succeeded in representing in their figures of the gods and heroes" (251). The latter dismissed Greek ideal beauty with a scornful remark that "there are even people who would prove to you that the artists of the Renaissance were great because they were imitators" (422). He continued: "Thus I put aside the past; I have in hand neither rule nor measure; I stand before new facts that I want to explain and comment on" (423).

Juxtaposition is the particular art of making an anthology, and in this art Taylor is a master. Because the whole collection hangs together, it could serve as a primary text for a study of art theory. *Nineteenth-Century Theories of Art* is not, however, just an exercise in juxtaposition and coherence. It can serve also as supplemental reading or resource material for more broadly based inquiries. Anyone interested in the cultural history of nineteenth-century Europe will find it illuminating. The selections are generous and sound. Many are interesting because they contain historically important concepts and terminology, for example, William Gilpin's comments on the picturesque; Tommaso Minardi on moral value in paintings; Théophile Thoré on seeing; Gustav Courbet on realism; and Félix Fénélon on the scientific use of color. How refreshing it is to find a collection that is thoughtfully and sensitively selected, efficiently introduced, logically organized, indexed, and well translated.

The book is not perfect. I would have appreciated some editorial reference backwards to Denis Diderot, whose commentary seems to have been important for later theorists. Among the commentary now available in English because of Taylor's efforts, I miss a selection from Zacharie Astruc; and I think that there might have been a selection touching on the aesthetic bases of japonisme in England and France. But these are minute items. More important, I believe, is the paucity of illustrations. The book is, to be sure, a collection of texts and not of visual art; but most of the theory properly deals with specific works of art. I realize that all cited works could not be reproduced in the volume. Readers would nonetheless have profited by inclusion of graphic references to appropriate works by Eugène Delacroix, Paul Signac, and Camille Pissarro, among others. Because Courbet's *Burial at Ornans* is so central to the theory of Champfleury and to other commentary, it should have been reproduced in larger format.

My minor criticisms aside, this volume ought be on the shelf of every library serving a college where humanities or art courses are offered. Its new inexpensive version makes it accessible, moreover, as a much needed text for students. It is destined, I believe, to be a staple text in academia.

TWO WORDS

William A. Graham, *Beyond the Written Word: Oral Aspects of Scripture in the History of Religion*, Cambridge: Cambridge University Press, 1987. 306 pp. $32.50.
Miriam Levering, ed., *Rethinking Scripture: Essays from a Comparative Perspective*, Albany, NY: SUNY Press 1989. 276 pp. paper $14.95. Reviewed by Phil Mullins, Missouri Western State College.

Teachers interested in a global approach to humanities education should note these two books which reflect an emerging trend in cross-cultural religious studies. Each of these two is readily accessible to the non-specialist; they are part of a growing body of scholarly literature which examines sacred texts in terms of the role such texts play in practical life of religious communities. Focusing upon exegesis of the Bible or the Qur 'an or any other sacred text is perhaps a necessary but certainly not a sufficient method of representing a culture and individual lives shaped by a particular text. Willfred Cantwell Smith, an historian of religion and Islamicist, has, for twenty years, been calling for a broader based approach to the study of sacred texts; these two volumes, which are the work of his students, indicate the potential of such a wider visioned historical and cultural consideration.

Both volumes open with philosophical reflections on the category of scripture as a part of the phenomenological and comparative study of religion. Graham summarizes the relational concept of scripture undergirding both books as follows:

> The study of a text as scripture . . . focuses upon its contextual meaning, interpretation and use—that is, the ongoing role the text has played in a tradition, not only in formal exegesis, but in every sector of life. To put it succinctly, "scripture" is not a literary genre but a religiohistorical one, and it must be understood as such (6).

Levering outlines some important issues with which scholars must struggle if they are to think creatively about the "fruits of the human tendency to 'scripturalize'" (5).

Rethinking Scripture continues the philosophical note struck in the editor's "Introduction" by including as its first two essays reflective pieces by Willfred Cantwell Smith. "The Study of Religion and the Study of the Bible" is Smith's 1971 essay first calling for a re-examination of assumptions about the study of the Bible: teaching the Bible ought to trace historically the roles of scripture "in the life of the imagination as an organizer of ideas, images and emotions, as an activating symbol" (22), argues Smith. In a new essay ("Scripture as Form and Concept: Their Emergence for the Western World"), Smith outlines the development of ideas about scripture in Western traditions. Levering's essay, "Scripture and Its Reception: A Buddhist Case," sets forth an interesting typology focusing upon the informative, transactive, transformative and symbolic functions of scriptural texts. Thomas Coburn's article examines and recasts traditional ways of conceptualizing Hindu religious literature; Kendal Folkert and Barbara Holdrege provide essays focusing upon Jain and Jewish notions of scripture which round out the collection.

Also included in the Levering volume is an essay by William Graham, "Scripture As Spoken Word," which is a nice summary of many of the concerns treated in depth in *Beyond the Written Word*. Essentially, Graham is interested in the way in which written and spoken word interpenetrate in practical life in historically and culturally different religious communities. He wants to "emphasize the oral aspects of written texts themselves and the relative neglect of these aspects in both modern scholarship and popular usage" (157).

Graham's book is nicely broken up in manageable sections and, like Levering's collection of essays, can be read in pieces. The first three introductory chapters discuss the historical evolution of contemporary attitudes toward written text, while the next three chapters examine oral and written aspects of the conception of scripture. Graham concisely reviews the contemporary "notion of the importance of writing for culture and history" (10); he comments upon the demise of rhetorical education and the development of the encyclopedia as two developments which suggest the impact of print on thought and social life. His third chapter explores the preprint relationship to the book and written word. Part I essentially exposes "the fallacy of the widespread presupposition that our modern Western relationship to mention that of other cultures" (45). The chapters in Part II aim to undermine the objectified image of scripture as tangible book. First Graham treats the historical evolution of the idea of scripture in the Judeo-Christian perspective; he argues that scripture has always had both written and oral associations in many traditions. Chapter Six explores in some detail the Hindu case which

> offers the one unassailable example of a highly developed scriptual tradition in which the importance of the oral word has been so central as to dominate and largely even to exclude the written word altogether over most of its long history (66).

Part III of *Beyond the Written Word* includes three chapters which show that in Muslim piety "the written word of scripture has always been secondary to a strong tradition of oral transmission and aural presence . . . (79)" Graham, an Islamicist by training, is most persuasive in his discussion here. He shows the development of Islamic notions of scripture and provides helpful comparisons with understandings operative in other contexts. He describes the recitative function of the Qur 'an and shows how recitation permeates personal and communal life in the Muslim context.

The final unit of Graham's book treats the oral dimensions of Christian scripture. After an introductory chapter on the early church and its sense of word and scripture, Graham has a chapter on the third and fourth century Pachomian monastics and a chapter on Martin Luther. The treatment of the Egyptian monastics and Luther are "historical cases of biblical piety in which this oral dimension is clearly evident" (118). What is most interesting about the discussion of the desert fathers is Graham's account of memorization as a basic discipline for monks and its connection with meditation. The interest in memorization carries through in the brief but quite cogent treatment of Luther.

Graham's conclusion nicely draws together the threads playing through his book. He solidly makes his case that the spoken word of scripture has been the "most important medium through which religious persons and groups throughout history have known and interacted with scriptural texts" (155). He ends with questions about modern culture, an era which challenges the "high-density vocal presence of scripture in public discourse" (167). Along with Graham's very readable thirteen chapters are over a hundred pages of notes and bibliography for those who wish to explore more thoroughly questions about the oral dimensions of sacred texts.

In sum, the Graham and Levering volumes will be excellent resources for humanities courses which treat sacred texts and cultural impacts of such texts.

BOMBS + LIFE

Robert D. Holsworth *Let Your Life Speak: A Study of Politics, Religion and Antinuclear Weapons Activism.* Madison: University of Wisconsin, 1989. 192 pp. Paper $14.75. Reviewed by Matthew Glass, South Dakota State University.

Nuclear weapons, gadgets so horrible to contemplate and difficult to understand that most of us chose to ignore them, are a difficult topic to either write about or teach. For the most part, those who focus on nuclear weapons either do so with the dispassion of strategists and engineers, or the fervor of moralism. In recent years, however, social scientists and humanities scholars of various stripes have begun a valuable study of the ways in which American culture has adapted to the existence of nuclear weapons. A notable feature of much of this literature, for instance Paul Boyer's *By the Bomb's Early Light: American Thought and Culture at the Dawn of the Atomic Age*, or A. G. Mojtabi's *Blessed Assurance: At Home with the Bomb in Amarillo*, is the authors' concern to establish the presence of nuclear weapons as a factor shaping our daily lives and discourse.

Robert Holsworth's *Let Your Life Speak* has managed to perform a similar service in terms of interpreting the lives of those Americans who oppose the existence of nuclear weapons. He focuses not so much on strategic arguments or political dynamics, as on the ways in which the ordinary dimensions of antinuclear activists' lives have been affected by their commitments. Holsworth, associate professor of political science at Virginia Commonwealth University, has provided a well-written study of religious antinuclear activists in Richmond, Virginia. Drawing on methods used more by ethnographers than by political scientists, Holsworth interviewed a number of activists in the Richmond area over a several year period during the 1980's. He chose to focus his efforts on religious activists for two reasons. The antinuclear weapons movement of that time was based largely in the nations' churches, a factor making it much more widespread, geographically and politically, than had it remained a concern of the secular Left. But more significant than his effort to get the movement's demographic features into focus, is his contention that the worldview and political motivations of the religious activists represent a growing characteristic of American political life, a trend which Holsworth calls "personalism."

Personalism, as Holsworth uses it, refers to tendencies within a growing number of political movements. Less systematic than a full-blown ideology, Holsworth says that personalists interpret our political dilemmas as requiring an integration of the values of public and private life. For personalists, the problem with our institutions is that they are not infused with the kind of caring, community-sustaining force that we find in the family or church. Personalists emphasize the political importance of individual moral responsibility, the potential for local action, and the need for an intertwining reform of both politics and culture.

The book begins with an overview of the religious intellectual roots of contemporary American activism. His survey points up the influence of earlier pacifists like A. J. Muste and Dorothy Day, the social reform wing of American evangelicalism, and the post-Vatican II Catholic Church. While brief, the survey is insightful, as when he underscores the way in which two often conflicting traditions of religious discourse, pacifism and just war theory, face a similar set of constraints when placed within the discursive setting of American politics.

In the bulk of the book, Holsworth presents the results of his inquiries into the lives of the Richmond activists. Chapters deal with the variety of ways in which activists respond to living in a culture that is unsupportive of their personalist worldview. Given this, Holsworth focuses on the arenas of the family and personal relationships, the problems of educating children to embody non-violence, the development of conscience and the maintenance of convictions, and the nature of citizenship in modern America.

Many authors in contemporary America do speak for what Holsworth identifies as a personalist perspective, and scholars have begun to analyze its role in particular issues. What makes Holsworth's study particularly valuable is the way in which he has connected the personalist perspective to several movements, both left and rightwing. Certainly feminists, anti-abortionists, radical environmentalists, the Moral Majority and peace activists have enormous differences among themselves. Holsworth's study of antinuclear activists is helpful in demonstrating how all of these movements, no matter how critical of this or that feature of our political life, have gained a public hearing by relying on many of the stock assumptions of modern American culture.

Holsworth's graceful style and lack of academic jargon alone make the book appropriate for classroom use. But even more valuably, he also manages to sympathetically, and critically, convey the depths of religious commitment which shape the political motivations of growing numbers of American citizens. I would use the book as a case study in a range of class settings addressing the issues of religion in American culture, political ideology, religious social ethics, sociology of religion or religion and politics.

ORDER! ORDER!

Bearers of Meaning: The Classical Orders in Antiquity, the Middle Ages, and the Renaissance by John Onians. Princeton University Press 1988. Reviewed by Fred Schroeder.

You've got to be really interested in European architecture to read your way through this volume, but it can be a rewarding, insightful experience. Moreover, in several chapters, it is a model for interdisciplinary humanities as we learn of the interrelationships of architecture, politics, liturgy, music, and mathematics. The book is copiously illustrated with over 200 architectural photographs and drawings as well as paintings that include architectural details. Not a picture is wasted, indeed what makes the reading rather slow going is that Onians (who teaches at the University of East Anglia) analyzes the illustrations so closely—and generally so surprisingly—that the reader lingers at each one, exploring at times with a magnifying glass.

For what the author is doing is teaching us to read architecture for its meanings, specifically in the classical "orders" of Doric, Ionic, Corinthian, and later, Composite and Tuscan styles. It is his contention that at least up to the year 1600 people's eyes were highly sensitive to architectural nuances; "Our ancestors used changes in their shape and placing to find their way through life. This book," he closes, "is intended to help us to relive their journeys." The different orders always have borne clusters of associations, associations such as ethnic and national self-esteem, personal status, institutional status, historical traditions and mystical significance. The Doric order of the Parthenon, for example, was an expression of pride to Athenians. The Ionic order was rejected in the Roman Christian church because it was associated with the Byzantine church. The apparent muddled jumbling of orders in medieval churches actually is subtly related to the spiritual passages through which the communicant goes. In some churches, the Composite (an Imperial Roman blend of Ionic and Corinthian) is the highest order, expressive of power, and therefore reserved for the sanctuary. In others, the Composite is viewed as an intermediate stage of the lower-status Ionic in the state of becoming the highest Corinthian. Some churches even have a kind of syncopated rhythm of orders in a colonnade, as a lowly order gradually is supplanted by the noblest order. A lot of numerology is involved, too, with twelve "apostle-columns" and a thirteenth Christ-column—of a different order, of course.

We learn, too, of deeply disturbing controversies about the propriety of building large, ornate Christian churches, especially using pagan columns. Onians sees this issue as the main impetus for the Gothic style, builders trying "increasingly to transform their churches from massive monuments into miraculous other worldly symbols." In this, and in many other things, Onians is an independent historian, flying in the face of many cherished opinions, such as that the Florentine Brunelleschi was a classical revival humanist. Not so, says Onians, he was a Dante "Tuscanizing" medieval forms. The bigger they are, the harder they fall in this book, or so it sometimes seems. Most disconcerting, though, is the way in which Onians will persuade you utterly of one rationale, such as the High Renaissance popes' insistence on the re-discovered Doric as the simplest, chastest, purist order for buildings, and then turns the reader about and gives an equally persuasive explanation for the Doric-loving Julius II building new St. Peters in the elaborate Corinthian. The lesson, is, though, that each structure must be taken on its own terms in its own context—what flies in Venice bombs in Florence, and "We must not expect the past to be simpler than the present and art simpler than life."

For integrative insights, I recommend chapters sixteen and seventeen on Luca Pacioli and Bramante, especially as it culminates in "architectural polyphony" and an analysis of Renaissance music theory, Leonardo's *Last Supper* and the combining of the orders in music-like harmony. It's not the only place, by any means; Onians' architectural reading of Titian's *Presentation of the Virgin in the Temple* is dazzling. The author's writing style is compact, but lucid. Most technical vocabulary is illustrated *en passant*, and if you have a fair command the outlines of western history, he manages to explain smoothly the specific political-religious contexts needed to understand the complex shiftings of orders through the ages.

PRELIMINARY CALL

for a special issue devoted to

BEYOND THE QUINCENTENARY

Articles are sought dealing with humanities teaching resources and curricula incorporating native American and relevant ethnic cultures.
To be published in 1992.

Paper deadline: October 11, 1991

Fred E. H. Schroeder, Editor
INTERDISCIPLINARY
HUMANITIES
c/o Interdisciplinary Programs
University of Minnesota, Duluth
Duluth, MN 55812

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity, humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have word-processed your article, please specify the program you used (we use WordPerfect). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

An introduction by the editor to:

UNITY IN DIVERSITY
Teaching the Global Humanities

The title of this special topical issue of *Humanities Education* was the theme of the National Association for Humanities Education's biennial national conference, held in Lafayette, Louisiana in April, 1991. All but the last of these half-dozen essays are versions of papers presented at that conference.

Global has become one of the watchwords of American education in the 1990s, although the origins of the pedagogical imperative to break loose from Eurocentric cultural studies are rooted in social studies movements of the 1930s. Like all the watchwords and tag phrases of educational reforms, *global* is a simplistic term, implying promises of covering all the cultures and histories of the globe as the venerable Sherwin-Williams paint trademark "covered the earth." Each of the essays that follows accepts the fact that while there is no responsible way to "cover the earth" comprehensively, there are many ways to diversify the Eurocentric curriculum, such as by introducing alternative life-styles, values and arts, by contrasting cultures, and by challenging the predominant western patterns of thought.

Burton Raffel, in his conference keynote address with which we start, pursues the problem and its solution in the smallest possible way, with the exploration of a single Indonesian poem. Jim Young Kim links the apparently polar opposites of ancient Greece and medieval Japan with the common element of "shame culture" in *The Iliad* and *The Seven Samurai*. Sharon Scholl, recognizing that exotic, nonwestern cultures are bewildering to most students, shows ways of classifying themes in traditional African art that provide conceptual handles for understanding alternative cultural values. Sheila Wright and Fred Schroeder both address the problem of integrating diversity into courses that are by *fiat* about the Western Heritage. Wright incorporates western works that challenge the values and practices of that heritage; Schroeder looks for contrasts in culture in the New World encounter of the Renaissance.

The final essay, by attorney-humanities professor Marilyn Garber is the most comprehensive globally. Using the unifying human theme of *ordeal*, she links diverse trials—real and fictional—from Socrates and Joan of Arc to Standing Bear and Jackie Robinson, in almost all of which a courtroom is a theater where the dominant society faces the challenge of alternative values.

Burton Raffel

TRANSLATION AS PEDAGOGY: TEACHING GLOBAL HUMANITIES*

My subject is so large, not to say immense, and to me is and always has been so exceedingly important, that truly to tackle it head on is pretty much impossible. So what I want to try to do—my deliberate and I trust not misguided experiment—is to immensely narrow down these immensities, to almost simple-mindedly limit myself to a single small door—and probably a back door, at that: I admit it—to the overflowingly rich and grand palace of knowledge and wisdom.

I have chosen as my approach a technique that might for lack of a better word be called "ping-pong." It has also been called, less positively, jerking your readers back and forth. You will see in a moment what I mean.

And I have chosen as my boundaries a single poem by a single poet, Chairil Anwar, who wrote in *bahasa indonesia*, the Indonesian language. My choice is predicated on several simple facts: (1) the very words *bahasa indonesia* were not invented until 1928 (which happens also to be the year of my birth); (2) Indonesian literature, at least in its modern form, did not begin until the 1930's, and did not truly hit its stride until the work of Chairil Anwar, during and after World War Two; and (3) not many people are likely either to know *bahasa indonesia*, or to have read much of Indonesian literature, or even to have heard of Chairil Anwar. And I'm afraid that what all of this means—the combination of ping-ponging approach and resolutely narrow subject—is that the mill wheels of my remarks are necessarily going to grind both slowly and terribly fine.

Two central facts about teaching global humanities which may seem utterly contradictory (but are not) have to be kept constantly in mind.

> First, it's a lot *easier* than it looks.
>
> Second, it's a lot *harder* than it looks.

It's a lot easier than it looks because, among other reasons, ours is an age of translation, and if there is a single absolutely essential requirement for entrance into the thought and expression of another culture it is a linguistic bridge across which those who do not know the language of that culture can walk. If you were to read in a reference

---

*This is the text of Professor Raffel's keynote address at the NAHE biennial convention, where the conference theme was "Teaching the Global Humanities."

1581

book, for example, or if I as an advocate of Indonesian culture were to assure you, that twentieth-century Indonesia's greatest literary figure was the poet Chairil Anwar, you might perhaps be impressed but you would not be significantly informed. That is, even if your source of information went on to tell you that, on a global scale, Anwar's literary stature and influence were approximately equal to that of, say, Federico Garcia Lorca, a singularly great and enormously important Spanish writer of incantatory poetry, magical plays, and fervent prose, even if you had a full and active knowledge of Lorca and his work you would still not have any adequate handle on who Anwar was and what he had accomplished. Told, further, that an entire literary age, sometimes known as *Angkatan '45*, or "Generation of 1945," was more usually known as *Angkatan Chairil Anwar*, "Chairil Anwar's Generation," you would not be much better off. If you then saw on the printed page, or heard on a tape, or even had read to you Anwar's most famous poem, *Aku*, you might be a smidgeon more aware of why such large statements were being made. But how *much* more aware? Here is the full text of *Aku*:

Kalau sampai waktuku
'Ku mau tak seorang 'kan merayu
Tidak juga kau

Tak perlu sedu sedan itu

Aku ini binatang jalang
Dari kumpulannya terbuang

Biar peluru menembus kulitku
Aku tetap meradang menerjang

Luka dan bisa kubawa berlari
Berlari
Hingga hilang pedih peri

Dan aku akan lebih tidak perduli

Aku mau hidup seribu tahun lagi

And how much more still would you know were I to add, truthfully, that one reason I myself am always so deeply moved by the poem's last line is the fact, which I can never forget, that an American woman I knew, who had spent a decade in Indonesia and then come home to the United States, only to fall ill and not long thereafter to die of cancer, came out of the anesthetic fog of the first of her many surgical procedures, hearing a voice, which after a time she realized was her own, saying over and over, "Aku mau hidup seribu tahun lagi." But if you also saw on the printed page, or had read to you, an effective translation of this poem, including the information that the title, *Aku*, means simply "Me," you would immediately be a lot further ahead of the game:

ME

When my time comes
I want to hear no one's cries
Nor yours either

Away with all who cry!

Here I am, a wild beast
Driven out of the herd

Bullets may pierce my skin
But I'll keep on,

Carrying forward my wounds and my
pain,
Attacking,

Attacking,
Until suffering disappears

And I won't care anymore

I want to live another thousand years.

And when you understand that the poem's final line, "Aku mau hidup seribu tahun lagi," means "I want to live another thousand years," you'll also understand both why my dying friend's unconscious mind was intoning it and why the memory still moves me as it does.

But it's also harder than it looks, because even knowing what the words mean, and even with my personal warranty that the translation is poetically sound (because it is my own translation and I spent fifteen years tinkering it into final shape), how much do you really know? You can probably figure out that Chairil Anwar was a rebel of some sort, perhaps a kind of James Dean figure—but could James Dean have any reality in Indonesian culture? (Note that Anwar was born in 1922 and died in 1949, aged not quite twenty-seven.) Is it possible from just the text of this poem to somehow infer that Indonesia is a collectively oriented society—so much so, in fact, that the word for custom, *adat*, is also the word for "law"? Knowing that, and understanding better what Anwar's rebelliousness truly involved, you would surely more fully appreciate why, once, an Indonesian doctor, met casually in a Philadelphia garage, started reciting this same poem to me, the moment he learned that I knew something about Indonesian literature, or why Indonesia has had a large and hugely celebratory national poetry contest named after Chairil Anwar. For all his appeal, James Dean has no such role in our national existence.

And is it possible to understand from a mere sixty-four English words (I have just counted the words in my translation) what it's like to walk down the streets of an Indonesian city, or to splash through the aqua-culture rice paddies where the country's staple food is grown? Is it possible from just sixty-four words in another language to understand the exotic flora and fauna, not to mention the incredible climate, of a country which sprawls for three thousand miles right across the Equator, a country which in just seven hundred and thirty five thousand square miles—the United States has three million six hundred and nineteen thousand square miles—throngs with just under two hundred million people? Our recent decennial census, whatever its final accuracy, assigns us a population of roughly two hundred and ninety million—that is, less than a third more people in a land area about five times the size. On one of my public relations visits to an Indonesian high school, I spent half an hour answering some of the trickiest—and yet most revealing—questions I have ever been asked. Indonesians of little income (that is, most Indonesians) do not own cars, nor is public transportation either extensive or reliable. In a hurry, at least in my days in a city like Jakarta, an Indonesian used to commandeer a kind of bicycle taxi, a rickety one-or two-seat affair (that is, two smallish Indonesians, but rarely more than one large American) in which the passenger sat in front and the driver, pedalling for his life, sweated behind. This inexpensive, effective, but (in heavy traffic) fragile and

1583

dangerous conveyance is known as a *betjak* or *tiga roda* (meaning "three-wheeler"). Was it true, one student asked me that, as she had heard, all the *betjak* in the United States had motors? Another student, a young man, asked me if Dorothy Lamour was a personal friend of mine.

Language, in short, is pretty much an insuperable barrier, as long as it dominates. But once that barrier is down, we still have a long, a very long way to go before we can with any degree of insight and accuracy present Indonesian culture to students who know even less about it than we do (and usually care even less than that). I am reminded of the first get-together my wife and I gave for the English Department at another university, shortly after I had joined the faculty. Thinking to please professors and their wives with what best pleased us, my wife prepared a large bowl of one of our very favorite party foods, steak tartar. When the get-together was over, we found that we ourselves were the only people who had gone near the stuff. Mind you, this culinary fiasco did not take place in a small cow-town in the middle of the boondocks, but in an American city of two million people. My colleagues had taken their PhD's at places like Harvard and Columbia and Northwestern; many of them had spent a good deal of time abroad. But raw meat—which was all they knew and all they wanted to know about steak tartar—was a global experience they were prepared to do without. Indeed, my own first experience of steak tartar, in Paris, was not dissimilar. I knew the name of the food from a song in Bertolt Brecht's *Die Dreigroschenoper*, "The Three-Penny Opera," but the name was all I knew; I did not know what it meant. Out of curiosity, and because I frequently sing the song to myself and like to know, when I can, what I'm talking about, I ordered it—and when it came, what I saw was a nice, neat pyramid of obviously raw ground beef topped by a shimmering and equally raw egg yolk. My stomach did flip flops; I seriously considered sending the whole thing back. And then my mind took over and I persuaded myself to try it—and I have been eating steak tartar, happily, ever since. Friends of mine have been served grotesque sea slugs on a bed of steaming white rice, and so on, and had no option, under the circumstances, but to smile and plunge forward, mouth wide open. Students do not usually feel any such compunctions.

But it is easier than it looks, because in the wake of swarming translators there quickly come historians and critics, as well as translators of nonliterary material, and the alert, curious mind can fairly readily fill in virtually all the major gaps. When I went to Indonesia in 1953, the proclamation of Indonesian independence was only eight years old, and true independence had existed for only half that time. Indonesia's former colonial rulers, the Dutch, did not give up control easily, or without a good deal of bloodshed. A few helpful books could be found in English, in those early days, most of them translated from the Dutch, but the pickings were exceedingly slim, and Dutch sources had their own biases. Today, the situation is very different. Not only is there a lot of Indonesian literature available in translation, including some first-rate novels and stories as well as poetry, but in addition to literary discussion there are excellent historical and political studies, and profoundly revealing books about Indonesian culture and religion. A few years ago I reviewed a fine account of early Dutch settlement in Indonesia, beginning two and three hundred years ago, a book which sheds a great deal of light on many subsequent developments, political, economic, and cultural. There are translated memoirs and autobiographies by sensitive and prominent Indonesians; there are travel books and technical treatises on subjects like *batik* fabric-making and *gamelan* music. The Republic of Indonesia has for many years put out a helpful free newsletter of economic data. There are superb books about one of Indonesia's major subcultures, that on the island of Bali, its rollicking art, its magnificent dance, its hypnotic music. Indonesian dance troupes visit the United States—and whether or not you have any interest in teaching about Indonesia, if one of those troupes comes anywhere near you, I urge you to get a ticket and go. Like other aspects of Indonesian culture, the dance is ultimately derived from that of India, and no less knowledgeable a cultural figure than Rabindranath Tagore, visiting Indonesia, declared with some sorrow but unimpeachable authority, that "the Lord Shiva has given them [that is, Indonesia] the fire and left us [that is, India] the ashes." Nor was Tagore speaking simply of Indonesian dance.

But to continue my ping-pong, teaching global humanities is also harder than it looks, for even the best translation is of necessity both partial and imperfect. The common Indonesian word for "want" or "desire" is *mau*. There is another word, considered to be considerably more *tinggi* (that is, higher, loftier in origin and tone), *hendak*, which means the same thing. I once heard a man ordering stamps in a post office, but using *hendak* rather than *mau*—and when I told this to one of my Indonesian friends, he got a beatifically happy smile on his face and sighed, "Oh, that's beautiful." How does a translator, no matter how skilled, no matter how sensitive, carry across such subtleties? The answer, in a word, is that to a large extent he or she cannot and does not. Robert Frost used to say that poetry was what gets left behind in translation, and though I disagree I certainly understand what he meant. I have on other occasions cited the time when, teaching an Indonesian poem in my own translation, a student discovered a pattern of imagery I had never before seen—and my immediate suspicions were fully justified, when I got home and took down the Indonesian text, for the fascinating pattern was something that had managed to creep into the English version but which had no parallel in the Indonesian original. That happens—and in bad translations it happens even more often. Ours is as I have said a great era of translation, but that does not guarantee the quality or even the accuracy of any specific version. I have on my shelves an alternative version of the line in Chairil Anwar's *Aku*, which as you may recall was rendered by me as "Away with all who cry!," which this other translation renders, limply, "There is no need to sob." And I have also seen a draft version of this same line, by a talented but very English Englishman, which turns *Tak perlu sedu sedan itu* into "All of this weeping is really not necessary." The title of one of Anwar's books, written jointly with two other rebellious young poets, is *Tiga Menguak Takdir*, usually translated as *Three Against Fate*. But *takdir*, which means "fate" or "divine decree," was also the name of a leading literary figure of the generation which preceded Chairil's, namely Sutan Takdir Alisjahbana, and the pun is not accidental. Since a homonym of *menguak* can refer to the croakings of frogs or the mooing of what passes for a cow in Indonesia, namely a *kerbau* or water buffalo, I have also seen a translation of *Tiga Manguak Takdir* as "Three Who Moo at Takdir"—a hopelessly absurd rendering that would have left Chairil himself, who knew English, rolling on the floor. But suppose you knew no Indonesian and "Three Who Moo at Takdir" was what you had in front of you and thought the words actually meant? It helps, surely, to know that in the line *Hingga hilang pedih peri*, which I have translated "Until suffering disappears," the word *peri* is a loan word from the Persian and thus has profound religious and historical associations. But if the version you have in front of you reads, like the same version which declares, comfortingly, that "There is no need to sob," "Until the pain is lost," the reader—and teacher—without an independent command of Indonesian is quite simply hung.

But it is also easier than that, because there are obvious indicia which any reasonably experienced teacher can use in order to evaluate both translations and other sources of material. We are all of us informal book-reviewers. It is not simply that we know what we like, but much more specifically that we come, over time, to know what seems to us sound and what does not. A translator into English who talks about poets mooing at other poets is in general not a translator to be trusted. I mean nothing racist when I say that a translation from Indonesian into English by Liaw Yock-Fang is, all other things being equal, less likely to have native-speaker authority than a translation by someone who is in fact a native speaker of English. There are extensive files of book reviews in any decent library, which can and should be consulted: nothing should be taken for granted. There are also indices of magazine articles, which can pretty easily lead to important though little-known material. There are annotated selective bibliographies put out by organizations like, in this case, The Asia Society. There are centers of Indonesian studies at places like Cornell, where I myself studied Indonesian, and Berkeley and Yale, places to which it is perfectly sensible to write for information and assistance. There are recordings of Indonesian music, and books full of gorgeous photographs of one of the most beautiful countries anywhere on the globe. There is an active Indonesian Embassy in Washington and assorted active consulates elsewhere in this country.

My experiment has of course been predicated on what might be called a worse-case scenario. It is manifestly harder to gain an adequate command of Indonesian materials than, say, those in French, German, or Spanish. Not only is the strictly linguistic distance greater—Indonesian being a Malayo-Polynesian tongue, while French, German, and Spanish all belong to the same Indo-European language family to which English also belongs—but there are all sorts of historical discontinuities to deal with. The English-speaking peoples may have fought wars with those who speak French, German, and Spanish, but they have also shared with them a good deal of relatively common ground. In sheer accessibility, as well as in range and quality of materials available, it is plainly easier to present French, German, or Spanish materials to exclusively English-speaking students.

But there are many other variables to be considered, if one is approaching the teaching of global humanities from a more or less logical position. Nigeria, for example, is a black African nation, yet much of its literature, at least in the twentieth century, is in English, thus presenting no significant linguistic obstacle. And it is a superb literature, including the novels of Chinua Achebe, Cyprian Ekwensi, and the plays and novels and poetry of Wole Soyinka—black Africa's first winner of the Nobel Prize for Literature. For both China and Japan, where the linguistic obstacle is perhaps still greater than for Indonesia, there is a rapidly growing and wonderfully helpful secondary literature, as well as a good basic selection of primary texts in translation. For classical Chinese and Japanese texts, in fact, primary works are often available in a number of translations, which plenitude offers the non-native speaker of these languages the opportunity to see a Chinese or Japanese original from a variety of perspectives. We now have in English excellent, marvelously detailed studies of how these languages work, and how their different linguistic operations are applied in literary situations.

In this age of translation, every year sees the availability in English of material once totally unapproachable except in the original tongue. Fifty years ago, who could have imagined even the possibility of a course in Catalan literature? It is now a completely real possibility, and the course could include both older and contemporary works, as well as both fiction and poetry. The situation is still not as good for such other important bodies of work as Hungarian, which has stunning poets and novelists. Czechoslovak, Polish, and even Italian literature are still insufficiently represented in English, though things are I think slowly improving. Most importantly, teaching global humanities is not a simple logical problem, to be approached or "solved" like a proposition in plane geometry. It is an area of deservedly intense emotion. Both the challenge and what seems to me the obvious basic reason for attempting to teach global humanities in the first place are issues quite possibly of even more than global importance. We humans are a diverse and widely scattered species, with incarnations in many sizes and colors, in many climes and times, and with almost uncountable variations in social structure, philosophy, and artistic expression. Just as one who knows only the Pekingese, or only the Great Dane, does not know much about dogs, so too one who knows only the United States does not know much about humankind—or about him- or herself. Nor can I think of a time in human history when this was a fact of more urgency than it is today.

SHAME CULTURE IN THE "ILIAD" AND THE "SEVEN SAMURAI"

Addressing the Conference Theme of The Global Humanities: Unity in Diversity, I have chosen the topic of "Shame Culture in The Iliad and in The Seven Samurai." In this paper I will bring together certain common elements in Homeric Greek and in the traditional Japanese cultures via the concept of shame. To begin though, I must first make an assumption that you have read the Homer's *Iliad* and have seen the *Seven Samurai*.

First, I would like to retrieve from your "permanent hard disk" memory parts of Homer's "Iliad" to illustrate what E. R. Dodds called the "shame culture." Cultures are either a *guilt culture* or a *shame culture*. By definition, in the guilt culture, people feel the pressure from God and will do things because of God's all consuming presence. The sense of guilt for the moral transgression comes from one's belief in the all pervasion power of God: Omniscience, all knowing, Omnipresent, all present God. In shame culture, on the other hand, the pressure to "do" or "not to do" something, comes from people, not God. In it group pressure makes people do things. It is this shame culture that we will be discussing from this point onward.

The 1954 film, *The Seven Samurai*, directed by Aikiro Kurosawa (who collaborated on the script by Shinobu Hashimoto and Hideo Oguni) was proclaimed by Donald Richie, (he has written several books on films) as the greatest film that Japan has produced. Because of its greatness, several westerns were made. You recall that the *Magnificent Seven*, directed by John Sturges in 1960, with Yul Brynner, Steven McQueen, Eli Wallach, Horst Buchholz, James Colburn, Charles Bronson, Robert Vaughn, and Brad Bexter was a remake of Kurosawa's *The Seven Samurai*. In this western, gunslingers try to rout the bandits who are devastating a small Mexican town. Memorable music, Marlboro theme, was by Elmer Bernstein. This film was followed by three sequels, starting with *Return of the Seven*. The fourth sequel was *Magnificent Seven Ride*, 1972. Directed by George McGowan, it stared Lee Van Cleef. Some of you may have seen even this 4th sequel. And you will recall that it was about a newly married gunfighter who decided to help his buddy fight bandits after they kidnapped his wife, a theme that is part of both our Greek and Japanese art-works.

The Seven Samurai itself is set in the seventeenth century Japan when feudal lords have been unified, and there are numerous "ronins" loose looking for masters to work for and, if need be, die for. Ronins are samurai without a

1589

master. Thus, seven masterless samurai are hired (at a price of three meals a day) by a village which is periodically raided by bandits, numbering 40. Previously, these bandits had kidnapped the wife of a Rikiche. He reminds us of Homer's Menelaus. You remember that it was Menelaus who lost his wife, Helen, to Paris, or as some claim, for example, Helen herself, that she was kidnapped against her will. Be that as it may, on with our subject matter at hand.

Through the device of "shame," of an appeal to the excitement of the battle, of the sense of honor, and of sheer sense of fearless duty to their profession, seven pass the test to defend the farmers. These seven are Kambei, Kikuchiyo, Katsushiro, Gorobei, Heichachi, Shichiroji, and Kyuzo.

In the course of the film's three and a half hours, we perceive not only the sense of "shame" that works in the Japanese society but several colorful subplots underlying it. This motion picture not only echoes many of the "shame" situations in the *Iliad* but several of its subplots as well. For example, Achilles is publicly shamed in front of all Achaeans when Agamemnon takes his Briseis. Ajax commits suicide because he was "shamed" by Odysseus. Also, the prized arms of Achilles went to Odysseus and not to Ajax. We read this in the *Odyssey* and in *Ajax* by Sophocles. In the Japanese film, a "Helen"-like character commits suicide by running back into the burning building that she had just walked out of, because she was too "ashamed" to face her husband. What these bandits had done to her, we will never know but we can imagine. It was so "shameful" that, in a split second decision, she made the choice that it was better to die than to explain why she did not kill herself before. We will see this again when we discuss the plot of the film. In the Book III of the *Iliad*, we find Paris "ashamed" for running away from the agreed-upon duel with Menelaus. Hector gives him a tongue lashing for his cowardice where upon Paris agrees to fight Menelaus.

As the greatest samurai, Kikuchiyo, contemplates his fate before the final battle in which he is killed, we are reminded of Achilles contemplating his fate of long but unremembered life or short but glorious one.

As the first recruited samurai, Kambei, lies to a thief and a kidnapper as a ruse to confuse and overcome him, we remember the fate of Dolon at the hands of Diomedes (Book X). There are several subplots. For example, as Katsushiro matures to manhood in the film, so does Achilles in the epic.

We also notice some parallels between the film and the epic. For example, Shino seduces Katsushiro. Hera seduces Zeus (Book XIV). And the duel scene in the film reminds us of several duel scenes in the *Iliad*. Kyuzo duels with and kills a brash samurai. To a samurai life and death is not important. Similarly, there are many instances of Greeks proclaiming their lineage and/or facing each other for a duel: Diomedes against Glaucos (VI), Paris against Menelaus (III), Hector versus Ajax (VII), and Achilles against Hector (XXII). Life to the Greeks in this respect is very Japanese-like: I quote from the *Iliad* Book VI, lines 145-150, (Richard Latimore translation):

> As is the life of leaves, so is that of humanity. The wind scatters the leaves to the ground: the vigorous forest puts forth others, and they grow in the spring-season. Soon one generation of men will grow while another dies.

Similarly, when Kambei asks his close friend, whom he had accidentally run into on a street, to join him in defending the farmers even at the risk of getting killed, he immediately answers affirmatively. The issue of life and death to a samurai is light as a feather. Consider what a legendary Japanese swordsman said:

> For the samurai to learn
> There's one thing only,
> One last thing..
> To face death unflinchingly
>
> Tsukahara Bokuden, 1490-1572
> (This passage is taken from D. T. Suzuki's *Zen & Japanese Culture*)

Hector wants to live but not in shame. Let me quote Book VI, 430 ff:

> Andromache begs: "Hector, thus you are father to me, and my honored mother, you are my brother, and you it is who are my young husband. Please take pity upon me then, stay here on the rampart, that you may not leave your child an orphan, your wife a widow..." Then tall Hector of the shining helm answered her: "All these things are in my mind also, lady; yet I would feel deep SHAME before the Trojans, and the Trojan women with trailing garments, if like a coward I were to shrink aside from the fighting;... (Richard Latimore translation)

For nine days Achilles drags the body of Hector around the barrow of Patroclus. The film also shows a warrior being dragged by a horse. Is this by accident?

The Greeks cannot quit their assault on Troy, even though it took more than nine years, because quitting would be "shameful." And all of the 40 Japanese bandits cannot quit either, and therefore die in the process of trying to plunder the farmer-peasants. For both Greeks and Japanese, it was better to die in battle than to live in "shame."

Another parallel between the two cultures has to do with their views on nudity. Nudity in Japanese society is not shameful. We know that traditionally a family bathed together. They considered it a natural thing. Community bath houses are commonplace in the Asian landscape. In the film we see one of the samurai almost naked. Similarly, ancient Greeks conducted Olympics in the nude.

As Odysseus is an untypical hero, so is Kikuchiyo. And finally the kidnappers (like the Trojans) lose the war and their lives. These are several similarities between the ancient Greek and the traditional Japanese cultures.

Now let's turn to the plot of the "Seven Samurai." This movie, like Homer's work, starts "in medias res," "in the middle of things." First, we see the bandits riding to a village only to realize that they raided this one already, and that they should return after the harvest. They ride off. Hidden nearby was a village wood cutter, and he reports the intention of these bandits to the villagers. Gathered together in a circle, they bemoan their condition (reminiscent of cacophony of pandemonium in chorus of Aeschylus' *Agamemnon* after Klythemnestra slew her husband) and the farmers decide to ask their oldest member for advice. "Hire hungry Samurai!" the patriarch says. Thus, a representative of villagers go to the nearby town looking for samurai. With the promise of only three meals a day, farmers have a hard time luring in willing Samurai. After being soundly rebuffed for several weeks, they observed a commotion in town. By a river a samurai in a Buddhist "habit" was being saved. A person in their midst explained that a thief blundered in his burglary attempt, was discovered, cornered, and to escape capture, had taken a child as a hostage, and was now inside a home. No one knew what to do until a samurai in his early 50s came along, asked for three rice cakes, changed his clothes, and was now shaving his head. Shaved, he looked just like a Buddhist monk. Giving his long and short swords to the monk who saved him, the samurai went to the home where the thief was and said: "I am a priest, don't be afraid. You must be hungry. I have some rice cakes." When the thief screams back to throw the food in, the samurai purposely cast it to the left of the thief. Presently, the samurai waits a few seconds and we see him rushing into the room. Villagers and we take notice. Then, we see the thief rushing out, taking five steps from the front door, and falling to the ground in slow motion, as Homer says, "biting the dust." The heroic samurai emerges with a child in his left arm, and a sword covered with blood belonging to the thief in his right hand. He drops the sword near the dead thief. The mother of the child cries in happiness as she runs to her child. All are impressed: the townsmen, the representatives of farmers, the very young samurai, Katsushiro and even the rough and worldly Kikuchiyo who has a sword that is so long that he carries it on his shoulders.

In the next scene, we see Kambei, the samurai who fooled the thief with his Buddhist monk attire, walking up the hill away from the town. As the representatives of farmers all agree that he is good enough, youthful Katsushiro rushes past these farmers, and grabs Kambei's leg begging to be made his student as he respectfully bows to the ground. Kambei is embarrassed and asks Katsushiro to get up. Kambei explains that he is a "ronin" searching the countryside looking for work himself. Soon, the uncommon samurai, Kikuchiyo, runs to them as if to congratulate Kambei for a job well done, but his familiar manner displeases Kambei, and they depart with distrust. By the time the farmers get enough courage to ask Kambei for assistance, they are in the next town. At a town's inn, Kambei listens courteously to the plight of these farmers, finds out the physical layout of the village, the number of bandits raiding them, but decides not to help them. One of the customers of this inn who witnessed this social intercourse, tells the farmers to die, that the life of farmers are worse than dogs. Youthful Katsushiro objects to this harsh retort but is too young and inexperienced to take up the challenge to aid the farmers himself. Kambei is made to see that farmers eat cheap and unpalatable millet while the expensive and much preferred rice would be given to the samurai. Kambei is thus "shamed" into taking this job that he did not want and he becomes the first of the seven samurai hired.

Kambei finds that recruiting others is not so easy. Samurai, as the highest among the four classes in the traditional Japanese society, has pride and shuns working for a group of poor farmers, especially when the pay is only three meals a day. In descending order, the hierarchy of Japanese is 1) warrior samurai, 2) farmers, the producers, 3) artisans or craftsmen, and 4) at the bottom were the merchants because they were considered parasitic, not producing goods as, for example, farmers did. Understandably, the samurai would rather serve a lord of a clan than the poor farmers. In his quest to quickly find suitable samurai, Kambei accidentally ran into his old friend in arms, Gorobei. After reminiscing their olden days, Kambei asks Gorobei if he wants to join him in his latest adventure: defend the poor farmers against the 40 bandits. Without batting an eyelash, Gorobei agrees.

In another scene, we see two samurai dueling in public with hundreds of people watching. First, they duel with bamboo sticks, and then because of a disagreement as to who won, they use their swords. In the 2nd slow motion, we see Kyuzo cutting his opponent in half. Kyuzo's victim would still be alive if he weren't "shamed" in front of the entire village. It was because he felt so "ashamed" that he risked his life to regain his honor. A samurai, worth his salt, must save his face.

In time seven samurai are selected and they travel to the village. There the young samurai, Katsushiro, falls in love with Shino, a village peasant girl. They are not supposed to cross the class line but under the stress of battle, they consummate their erotic desires. In the center of the village, there is a huge bonfire devouring itself. When these lovers are discovered by Shino's father (Manzo), Katsushiro, the samurai, is so ashamed that he cannot move. He stands frozen with his head stooped in shame, while Manzo beats his daughter, chasing her around Katsushiro. He is helpless to lend a hand in her defense. He knows that he has done wrong. When villagers become aware of this commotion, Manzo, to protect his honor, claims that Shino was seduced by a samurai. He says *a* samurai not Katsushiro but everybody can see with their own eyes who that samurai is. No need to affront the establishment. But we know that she is the one who made advances to Katsushiro, just as Hera had seduced Zeus (Book XIV). At any rate, it starts to rain. Katsushiro hadn't moved a muscle. Shino lies nearby, crying. Symbolically and graphically the exterior bonfire starts to die out, reflecting the aftermath of consummation. The villagers' curiosities also being satisfied, they take cover and begin to go home.

Before the battle is fought in the village, the leading samurai, Kambi, decides and others consent (Japanese act by consensus) to make a raid on the bandits' fortress to reduce their number. Accompanied by Rikichi (Menelaus), the feisty farmer as their guild, three samurai ride horses to the camp of the bandits. Catching them asleep, Rikichi sets fire to their rear, while Kikuchiyo, Heihachi, and Kyuzo wait for the bandits to get out the front door. Inside, one of the females gets up, sees the smoke but does not alert others, but

1593

instead smiles with a mysterious inner grin. This reaction surprises the three samurai but in a few seconds everybody inside starts to flee the fire. Several bandits are cut down as they run out of their lair. The last to emerge is that lady with the strange smile. Recognizing Rikichi at the door, she screams and runs back into the burning building. We learn that she was the wife of Rikichi and that she was kidnapped by the bandits last year. She was so "ashamed" that she preferred death than to live and explain herself to her husband. (This is a Japanese film, set in the 17th century before modernity and women's rights.)

At the end of the story, Shino (Hera), tearfully sings her dirge as she transplants rice in the fields with others. Katsushiro, her one time lover, is unable to comfort her. She is a peasant. He is a samurai. And twin should not have met. He knows his place in society. She knows hers. His life was enriched by surviving the battle. And he has a better notion of the human condition. But he will move on. She will survive in the village, and when she gets married, her parents will arrange her wedding with a boy in another village far away. And he will be, at first, ignorant of her bonfire experience with Katsushiro.

There are several more things that I could say about the Ancient Greeks and the Traditional Japanese society, but let me conclude here with a few observations. Greeks and Japanese are both shame cultures in which their citizens behave according to group pressure. It is interesting that from our "Conference Theme of Global Humanities: Unity in Diversity" that both of these cultures seem to share many affinities. They indicate unity in that they explicate the human condition, our condition. Because Greeks and Japanese show unity in what they are about, one race, human race, we can understand them and appreciate them.

AFRICAN THOUGHT IN AFRICAN ART

One of the most important challenges for interdisciplinary Humanities is the integration of worldviews of non-Western cultures into our teaching process. It is also difficult to do because so few of our natural assumptions can be relied upon. So much background material is needed before we can make any sense of the blizzard of images, sounds, and concepts pouring in from places whose very geography is tentative in our minds. If a few general organizing principles can serve as anchors in the flood, many puzzling particulars can find a foothold in our syllabi and perhaps make some sense to our students. This paper proposes three such principles around which a great deal of traditional African art can be clustered with some confidence and without doing violence to the individual expressive integrity of specific works. These principles are broad enough to encourage movement across two disciplines, visual art and religion, and thus reinforce the interdisciplinary approach.

Why use traditional art at all; isn't this tribal stuff really over the hill by now? Though areas of Africa are thoroughly urbanized and as modern as downtown Chicago, most of it is rural. The majority of Africans still live in villages and carry on some forms of their traditional life. The worldviews and their artistic realizations that this paper proposes are still current in much of Africa, surviving in altered forms in the most sophisticated cities. There are traditional carvers making a decent living producing traditional images for a newly aware world market. The fascination they exert upon African-Americans alone insures a steady market into the foreseeable future. Finally, there are major collections of traditional art in museums throughout the Western world; our students are very likely to visit some and will want to know what these images are all about. Books on traditional African art continue to issue from Western publishers and are bought to grace coffee tables as well as library shelves. Traditional African art is so consistently available that students have plenty of use for whatever instruction we can give them as to its appropriation.

All over the world people who live in tribal groups have similar world views. There are certain basic conclusions about who we are and what the world is all about that are held in common. One of these conceptual characteristics is called **animism**, the belief that a spiritual presence in the universe animates all reality. There is an invisible power that can be translated into physical change. Specialists trained in such matters can lay hold of this power and use it for good or evil. We would call such transactions dabbling in magic and label practitioners witches, sorcerers, etc.

Animism has relatively crude forms, such as the belief that rocks and trees have spiritual presences which must be appeased before these natural forms can be disturbed in any way. (Even so, would we not have a better world if every bulldozer operator had to make peace with every tree he demolished and find another equally attractive place for the spirit of that tree to occupy?) Yet the basic perception which animism describes is remarkably like that of British physicist David Bohm, who describes the universe in his book *Wholeness and the Implicate Order*. He understands the cosmos to be a single hologram; information about all of it is encapsulated in every part of it. The "holomovement" of the universe is a kind of higher-dimensioned reality, a sea of energy in which the ripples on the top are the pieces of reality we are able to witness. When we look at a tree, Bohm asserts, we are simply seeing an unfolded aspect of this higher reality. Now, your average pygmy would hardly describe his experience of the world that way, but at its core he and David Bohm are speaking as animists.

There is a whole class of African art made to focus or capture the free-flowing power of the universe: the fetish. Fetishes come in all sizes and shapes from the smelly charm worn around the neck to keep bullets off to statues bathed in chicken blood resting on village altars. To be sure, fetishes have their humorous or unsavory side (from our point of view), but the thought process they represent is deep and powerful. They are made to capture protective spiritual energy in order to bring about desirable results for the buyer. They contain a "power pack" not unlike our concept of a battery, except that the power is spiritual and is typically composed of hair or other remains of a powerful ancestor.

Figure 1 is a rather large fetish originating among the Bakongo people of central Africa. Into the stomach is carved a niche where materials thought to be effective would be placed. The polished shells set into the eye sockets give the figure an aspect of life as light shimmers over their reflective surface.

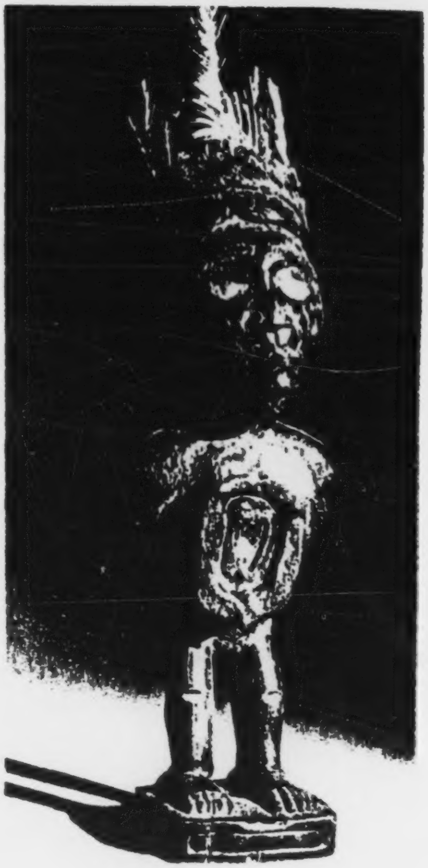

Figure 1

The elaborate headdress is composed of two parts. The base may be tightly braided hair from a powerful individual, while the top is composed of a ring of chicken feathers. These latter tokens give evidence that the requisite sacrifices have been performed, and the postulant is serious about his request. One should not think of this object in artistic terms; it is a functional construction. If it is used properly and fails to bring about the desired results, it will simply be discarded.

Figure 2, from the Ashanti people of Ghana, is interesting in that it is used only among women. Though these images are coveted by Western museums, they were originally fetishes made to guarantee that a woman would become pregnant, and that the resulting child would be all her heart desired. These doll-like figures were made small so that a woman could tuck one into her waistband, and larger so that it could be set upon a home altar. With their broad foreheads and tiny, closely set features, such figures represent the Ashanti standard of feminine beauty. Because this people is traditionally matrilineal, girl babies are particularly desirable, and this fetish represents the maternal fulfillment for which every woman yearns.

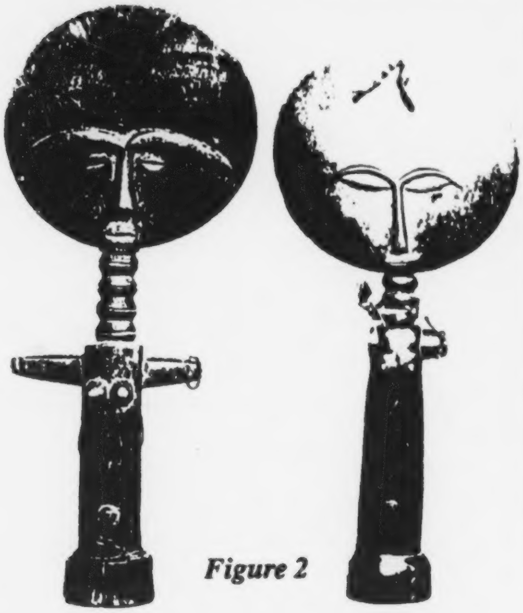

Figure 2

Figure 3 derives from the Baluba people of Zaire, and exhibits the indwelling of that spiritual force which animates the universe in a particularly vivid way. It is used at the initiation of young men into their adult social roles and represents the spirits revered by the Baluba. One of the adults charged with the instruction of the young would don this mask, clothe himself in obscuring garments, and speak with the voice of a spirit to impart the symbolic history of that people. The white swirling lines made by insets of kaolin on the wood surface wonderfully symbolize the spiritual energy of the universe, its radiance pulsating to dance and the beat of drums. This mask testifies to the limitations of book illustrations, or

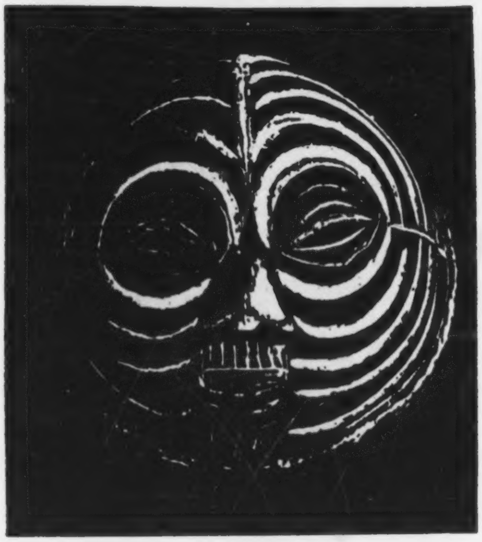

Figure 3

even museum exhibits; a work like this has to be seen in action for the passionate energy it captures to be truly felt.

Animism, the unseen spiritual power of the universe, is generally thought to be resident in natural phenomena. Much of nature is, then, sacred in traditional African thought. Figure 4 is an unusual realization of the mystic power that animates nature in that it is humorous. Homer was not the only ancient to represent gods as comic beings. The Ibo of Eastern Nigeria revere Amdioha, the thunder god, and his wife, Ala, the earth mother. The Ibo are not above modernizing their gods in somewhat bizarre ways. Here the thunder god is riding a motor bike and carrying Ala in a side car. Another metaphoric set portrays Amdioha as a European explorer with a large (presumably noisy) pistol, and Ala as his elaborately dressed wife complete with beehive hairdo.

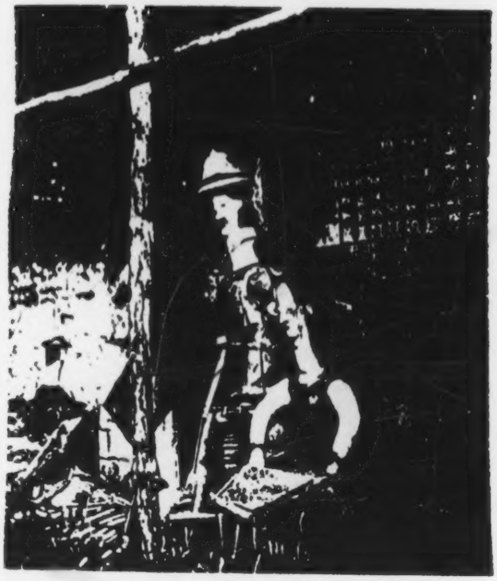

Figure 4

The sky and earth deities of the Ibo are enclosed in Mbari houses built at the beginning of the planting season and during times of emergency. The clay representations symbolize central spiritual functions of life giving and taking, as well as arbitration in human affairs. Building Mbari houses is a special work commissioned by a cult official, and is an extended project of several months' duration. The objective is the symbolic incorporation of spiritual power which conveys life, and by which the earth and the human family are constantly renewed by birth and death. Animism, thus realized, is a significant aspect of traditional African mentality, teaching us our place in the universe and offering the hope that the tremendous unseen forces that surround us can be used for beneficial effect.

Equally important as a fundamental orientation is the belief system generally termed *ancestralism.* It celebrates the inviolate connections between human generations that persist past the boundary of death. Traditional Africans are guided throughout their lives by the counsel of deceased persons; they are the "living dead" in the best sense of that expression. Of course, if they are not honored properly, they may cause illness or bad luck. Some portion of every person's time and resources must be spent in sustaining these spiritual presences which most often visit in dreams.

A Westerner might wonder what possible purpose such a belief could serve. It is an extremely comforting idea, assuring us that we are never alone—not even in death. Someone we have known and loved is always available to us. Someone closer to the spirit world has a protective interest in us and will spare us many difficulties if we will heed their counsel. No estrangement, alienation, or nihilism need apply where this ancient belief holds sway.

African art is replete with ancestral images, and their symbolic content can be as complex as that of a Western Medieval altar triptych. Figure #5 is a case in point. It is an ancestral image from the Dogon people who, before the descent of the Sahara Desert, inhabited much of the northern area of Mali. Such a sculpture would be placed on a village altar or a home altar of its prosperous commissioner. Like many similar African images, the Dogon piece represents both male and female characteristics, a possible reference to the period in the creation story before sexual differentiation. It also reflects upon the period after death when such characteristics are of little consequence.

The figure is holding a child, conveying the idea that babies come from the same time zone inhabited by the deceased—that they pass each other coming and going, so to speak. Sometimes the larger figure will have an infant-proportioned face and a mature body, delivering that same message. The main figure is seated on a stool, the legs of which are carved to represent the eight original Dogon ancestors first created by God. This symbol of eight is a recurring motif in Dogon art. The style is highly geometricized, indicating that the image has been worked over for many generations until certain classical proportions have been settled on by master carvers and their workshops. The carvers have worked within the universal framework of traditional ancestral figures: formal frontality, symmetry, delicate internal decoration, and glossy surface. They have also left room for the exhibition of high technical skill in the extreme attenuation of arms and legs, reaching a successful balance between individual showmanship and communal expectation.

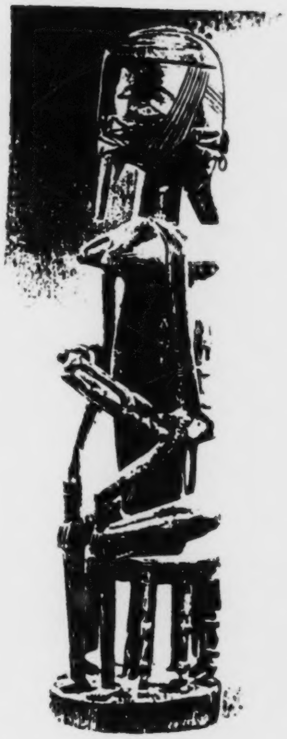

Figure 5

The Ibo people have been subsistence farmers from time immemorial, their attention naturally focused upon the crop cycle. Yams have been their staple crop, and the spirit which gives and protects the yam harvest is a major object of veneration. Figure #6 is a large pottery ensemble placed on the altar of Ifijioku, the yam spirit, and represents in a symbolic manner the continuity of the family in this agrarian tradition. The three wives of the head of the household are the dominant figures, each shown holding a baby. Other figures incorporate extended family relationships; they are engaged in appropriate acts of worship (making offerings and an animal sacrifice). In this weave of ideas the family extends down the generations and outward through age groups. Their collective action, as passed through these human chains, keeps everyone safely sustained in the spiritual grace of Ifijioku, their protector.

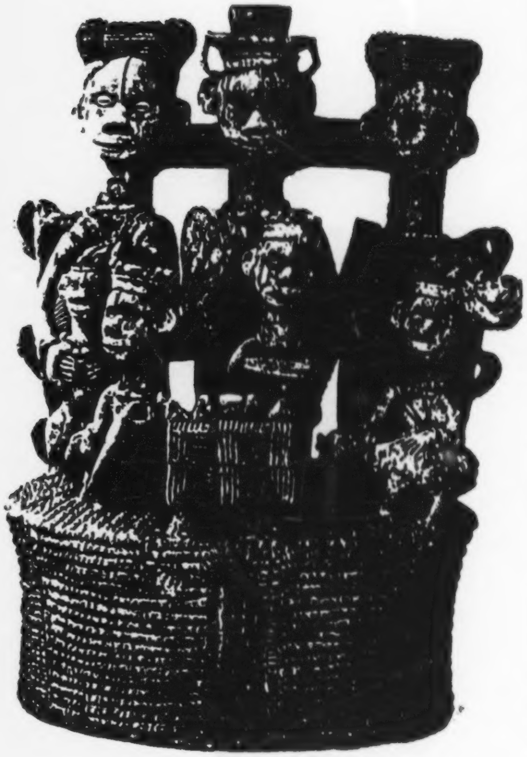

Figure 6

Artistic representations of ancestralism include a wide variety of styles and forms ranging from highly abstract to naturalistic. The sleek simplicity of Dan masks (Figure #7) has made them popular with peoples throughout Liberia, Guinea, and Sierra Leone. Sexually amorphous in appearance, they are used in varied ritual roles. This one is a mother mask, used to summon the spirit of a deceased female ancestor to protect newborns and to settle strife. Its symmetry and orderliness of design radiates the proper sense of calm. Such masks may be more specifically personalized by incorporating hair from a special ancestor. The idea that the spirit summoned resides beyond the boundary of death is conveyed by the use of slit eyes (as though someone looked through the mask from far away). White color often used to outline the eyes also suggests death, as it is metaphorically linked with the white of bones. The general sense of these matters is that the dead continue to care for us and are able to effect changes in circumstances that work to our benefit. Maintaining the proper ritual link with these ancestral spirits is an important, though time-consuming task, and objects created by master carvers can aid the process.

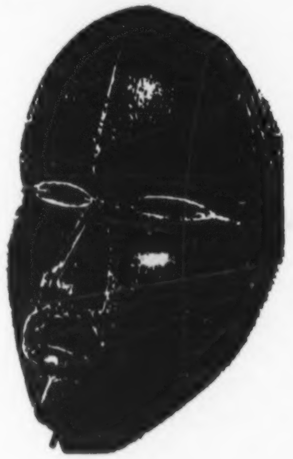

Figure 7

The third grand organizing concept typical of traditional life all over our planet is **totemism**, the belief that humans are mystically linked with other forms of life. The fact that we destroy animate life to use for our food supply leads to a crisis of conscience: how can we thus misuse our kindred? In an attempt to restore this constantly torn relationship, peoples select one form of life to reverence, this representing their ideal but impractical feelings about other life forms. The item selected is usually animal, though there are palm tree clans and butterfly clans, along with other exceptions. The chosen life form will be linked with the spiritual life of the clan and become, as it were, a motivic signature of that people.

Figure #8 is a Chi Wara mask from the Bambara people living in the Niger Bend region of Mali. It is a mask only in the sense that it sits atop the head of the wearer, who is otherwise covered in layers of raffia so that the illusion of his becoming the spirit invoked is complete. The mask is used as part of a vigorous spring planting dance and represents the antelope who, at the beginning of tribal history, taught the Bambara people agriculture. The work is a complex of symbols. The body is actually that of an aardvark which burrows in the earth, suggesting the act of planting. A zig-zag pattern incorporated in the neck section represents the path of the sun across the heavens. The mane is depicted in a pattern that resembles ripples of water, the third element needed for plant growth. Finally, the tall horns incorporate tassels or fans of cut leather to simulate the flowering millet stalk, the staple grain of that area. In the ritual at which the mask is used men dancing the role of the antelope spirit have women partners who dance behind them, thus generalizing the concept of fertility to the human plane. In vast, dramatic gestures the horns are swept in great circles over the plowed ground, to the accompaniment of instruments and singing. Thus an animal becomes a link between humans and the mysterious forces of gestation and growth.

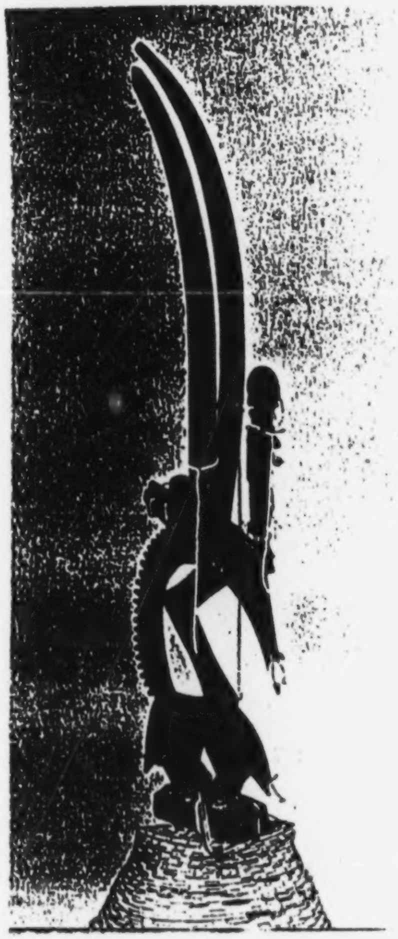

Figure 8

Geography and economics play some role in the choice of totemic animal. Figure #9 is a mask representing the buffalo spirit revered by the Anyang people inhabiting the Cameroon grasslands. Some African groups who make a partial living by animal husbandry do not ordinarily use cattle for meat, for they constitute wealth which is to be spent sparingly as an animal ages and does not produce milk. The vast bulk of the carving with its decorative detail and glossy surface testifies to the dignity of these beasts and the regard in which they are held by their owners. The very attitude projected has much in common with Albert Schweitzer's phrase, "reverence for life."

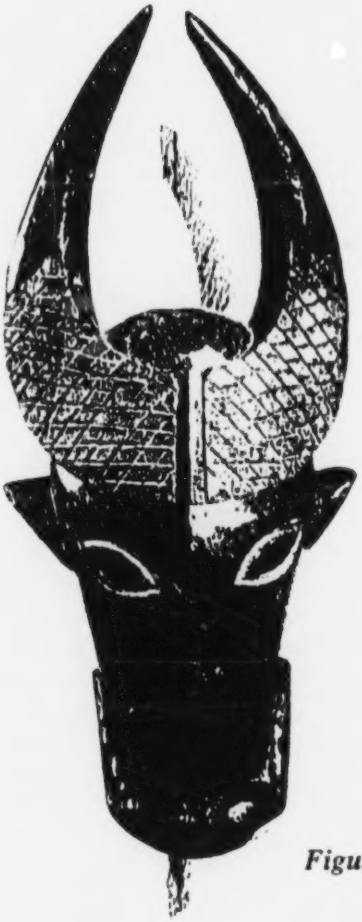

Figure 9

In summary, there are thousands of artworks that share these same three generative thought processes. Each work, of course, is a significant expressive item which is worth individual analysis and appreciation. The points of view of animism, ancestralism, and totemism are so fundamental and pervasive that they can be quite useful in organizing the mass of African visual material and linking it with other aspects of the culture that would be included in an interdisciplinary Humanities course.

PAINTED BIRDS AND MOTORCYCLES: EXPANDING VISIONS OF WESTERN HERITAGE

"A Western Heritage: The Humanities" is one of eighteen interdisciplinary courses in the All-University Curriculum (AUC) at the University of Hartford. Through interdisciplinary courses emphasizing classical and contemporary knowledge, this curriculum focuses on the core of learning that is essential for the well-educated adult. All students in baccalaureate programs at the University are required to take at least four All-University Curriculum (AUC) courses during their four years—one course from four of the five breadth categories. Each school and college of the University determines which of the four categories are required for its majors. The five breadth categories are: Living in a Cultural Context - Western Heritage; Living in a Cultural Context - Other Cultures; Living in a Social Context; Living Responsively to the Arts, and Living in a Scientific and Technological World.

"A Western Heritage: The Humanities" is one of four courses presently offered in the Western Heritage category. Approximately eight sections of this course are offered each semester. Although faculty are free to choose their own texts, *Zen and the Art of Motorcycle Maintenance* and some works by Plato are taught in all sections. In addition, many of the faculty now use *The Painted Bird*. Other readings differ by professor and by semester. The course, which integrates selected readings in literature, philosophy, history and the humanistic social sciences, considers the contemporary search for solutions to the age-old problem of establishing a common understanding of truth, art and ethics. All of the readings, writing, discussion and activities compel students to grapple with the perplexing questions of value and meaning that have plagued humankind through the ages.

In many ways, these are extraordinarily charged times to be teaching a course in western heritage. Never before have the questions been so pointed and so poignant. Whose heritage is it? What is worth claiming and what needs to be disclaimed? Is there a western heritage, a "one size fits all" legacy to be transmitted from generation to generation? Are there absolute truths or is a Euro-centered curriculum inherently racist, sexist, classist? The debate on the canon has trickled down from the ivory tower to the streets. Everyone has a "great books" theory.

I don't propose to answer any of the above questions, tempting as they are. This paper simply focuses on two of the central works I use in "A Western Heritage" that successfully move the course from a traditional and somewhat exclusive view of the humanities to a more inclusive vision of western heritage. The two books, *Zen and the Art of Motorcycle Maintenance: An Inquiry into Values* by Robert Pirsig and *The Painted Bird* by Jerzy Kosinski provide rich opportunities for exploration of values and expansion of the meanings of 'western' and 'heritage.'

The course begins with Pirsig's autobiographical work, a piece posing contemporary American problems and perspectives. The narrative is one in which the search for "Quality" is set out in a series of chautauquas, reflections or dialogues. While on this physical, mental and spiritual journey, the narrator posits that a central problem of contemporary Western culture is the separation of society into romantic and classic modes of perception, the former associated with "feelings" and art, the latter with reason, analysis, science and technology. The narrator attempts to dissolve the dualities, both metaphysical and workaday, that he sees as the roots of civilization's problems: subject and object, mind and machine, thought and action, romantic and classical thinking (DiSanto, Steele 1990). His "solution" is a return to pre-Socratic, action-oriented, *doing, with care*—as in motorcycle maintenance, with sidelong glances at Eastern modes of perception and action in Zen (Brayfield 1987).

The solution proposed in this work inevitably leads to a discussion of an ethic of care and the role of human values in the search for knowledge and the good life. A look at other cultures' ideas of 'doing with care' and the works of Gilligan (1982) evoke lively discussion of the ethic of care in the context of rights versus responsibility. Excerpts from *Women's Ways of Knowing* (Belenky et al, 1986), especially the chapter on connected teaching, encourages examination of the concrete, everyday experiences in our educational settings.

Belenky *et al* argue that students can develop authentic values if educators emphasize connection over separation, understanding and acceptance over assessment, and collaboration over debate (1986). Connected teachers understand Pirsig's statement that "The real cycle you're working on is a cycle called yourself. The machine that appears to be 'out there' and the person that appears to be 'in here' are not two separate things. They grow toward Quality or fall away from Quality together" (1979). Analysis of student disengagement in the learning process, the lack of 'doing with care', the relationship between alienation and issues of race, gender and class, readily emerge from the readings. Student journals and group discussions are useful here. In all discussions, the reference point or touchstone is *Zen and the Art of Motorcycle Maintenance*.

Students begin to observe the dualities and the sense of isolation that accompany persons or cultures when ideas are cut off from action, heart separated from mind, science, art or religion posited as value-free. For example, They better understand Richard Rodriguez's statement that he felt divorced from his body in *Hunger of*

Memory, the concept of private and public language, the concept of "Double-Face" in *The Joy Luck Club*.

Conversely, they find a richer, 'connected' Socrates in his willingness to die for his ideas, understand better Martin Luther King's reference to Socrates in his "Letter From a Birmingham Jail," and feel the sense of care and responsibility in Antigone's actions. Of course, they continue to question why those leaders who act with care, attempt to do the right thing, are such threats to society that ultimately they must die. *Zen and the Art of Motorcycle Maintenance* expands students' understanding of the complexities, the gains and losses, the dichotomies that have accompanied the development of western heritage. It provides a lens through which they can better frame contemporary problems while re-focusing on the past.

The Painted Bird, Jerzy Kosinski's brutal novel about a young boy separated from his parents during World War II, casts another light—shadow might be a better term—on western heritage. There is no book I have ever used, in any course, on any level, which captivates students more than this savage work. Students are at once repulsed by and attracted to the tale of the young boy abandoned by his parents, wandering from village to village in Eastern Europe. Students are forced to look at humanity in its most inhumane trappings—the trappings of war. They search for good, justice, an ethic of care in a world where survival and self-protection are constant concerns. They begin to grasp the levels and layers of the image of Lekh's painted bird, killed by its own because its appearance is different. The young boy, abused because he is dark-haired and dark-eyed, represents all painted birds, outcasts from cultures, groups, or social institutions because they look or sound different.

The image of the "Other" is powerfully planted in the students' minds—one student, in fact, portrayed it as a "laser image right in the middle of my forehead." Regarding the peasants in *The Painted Bird*, Kosinski says they symbolize and personify the level to which the so-called European Civilization was forced by World War II. They became part of the persecution and lawlessness which the war had been preparing them for. They understood this terror, because it occurred within the elementary categories of brutality, committed by the strong against the weak, the victors over the vanquished (Kosinski 1965). *The Painted Bird* provides unusual glimpses of both brutality and kindness, the beautiful and the sublime; the boy is beaten often and unmercifully, yet, at times, individual peasants and German soldiers risk their lives by caring for him.

In previous years, I have ended the semester with *The Painted Bird*. However, as the student population changes and as I begin to revise my own ideas on the 'what' and 'how' of western heritage, I find that this book provides a provocative opening to an examination of power and powerlessness, 'primitive' versus civilized terror, and the image and role of the Other. The idea of a 'marginal' life becomes real to students. Students begin to see other 'painted birds' on the subways, under the bridges, in shopping malls, in the student union and in the classroom.

Sometimes they see the image in the mirror. They understand that the boy's experiences make him *feel* like Lekh's painted bird. There are countless works that can be used in conjunction with *The Painted Bird*. Ellison's *Invisible Man*; Camus' *The Stranger*; Morrison's *The Bluest Eye*; Walker's *The Color Purple*; Kingston's *The Woman Warrior*; Barnes' *Nightwood*; Huston's *Their Eyes Were Watching God*; and countless other novels and short stories illustrate the painted birds' perspectives on the meaning and value of western heritage.

And, of course, with Kosinski's shocking suicide in early May of this year, the book will take on another dimension, opening the way to new questions, concerns and reexamination of the relationship between art and life. Certainly Kosinski's death will extend the metaphor of the painted bird.

My enthusiasm regarding the power and effectiveness of *Zen and the Art of Motorcycle Maintenance* and *The Painted Bird* has been affirmed by a recent study conducted at the University. A fifteen question survey on general education was given in the spring (1991) to a random sample of students graduating from the seven four-year colleges at the University. In response to the question "What book, play or performance made a lasting impression on you?" *The Painted Bird* and *Zen and the Art of Motorcycle Maintenance* were the most often cited. No other work came even close to eliciting as many responses as either of these.

Zen and the Art of Motorcycle Maintenance, often criticized for being a 'masculine' book inaccessible to women, and *The Painted Bird*, often criticized for its sexual violence and sensationalism, both provide extraordinary opportunities for expansion and inclusion of diverse ideas, values and meaning in any course on western heritage.

The National Association for Humanities Education

announces

CALL FOR PAPERS

FOR A SPECIAL ISSUE OF ITS QUARTERLY JOURNAL INTERDISCIPLINARY HUMANITIES ON MUSIC: THE LOST DIMENSION IN THE HUMANITIES?

Papers are sought on the theory and practice of music within the interdisciplinary Humanities context. Many different approaches are welcome and our readers are interested in all levels of humanities learning: university, adults out of school, secondary, etc.

How do you integrate music into various Humanities contexts (historical, thematic, comparative arts)? What are the workable links between music and other materials?

What to do about the "great works"? How do you create useful resolutions to the abyss between art music and commercial popular genres?

In a Humanities context, how much of the technical features of music is too much? What is essential and helpful?

What should be the outcomes of music study within a Humanities course? How does one assess these outcomes?

Within the Middle School and High School curriculum what should the aims of music be in a Humanities course? What experiences have teachers had in integrating music into a team approach in Middle School?

How can the live program be used as a learning experience rather than just as entertainment?

Articles should be 10-15 pages, double-spaced. Instead of footnotes, provide a list of sources or a bibliographic essay.

Also WANTED: "Great handouts"

Do you have useful analysis guides? Listening charts? Music and History outlines? Musical definitions?

To subscribe to Interdisciplinary Humanities, make out a check for $20 to N.A.H.E. and send to J. Stanaway, Subscription Manager, 365 ABAH, University of Minnesota Duluth, Duluth, MN 55812.

SEND YOUR PAPERS, HANDOUTS, ILLUSTRATIONS, ANALYSIS GUIDES, ETC. TO THE GUEST EDITOR FOR OUR SPECIAL EDITION BY JANUARY 1, 1992:

Dr. Donald Metz

GLOBALIZING THE EUROPEAN RENAISSANCE: PROBLEMS AND ANSWERS

Whenever we plan and teach a humanities course we tell lies. Sometimes we lie out of ignorance, sometimes we lie because we prefer to forget the truth, and sometimes we lie on purpose. All three kinds of lying are endemic to globalizing the curriculum, indeed, the more we try to be culturally inclusive, the more likely will be our prevarications. Ignorant lies are easiest to comprehend, especially as to factual data, but when we don't acknowledge the existence of an Islamic literary tradition because we know nothing of it, or ignore African culture because we don't have a degree in African history, it is a studied ignorance, not mere innocence. Preferring to forget the truth often takes the form of burnishing the images of non-western societies so they'll get the respect due to them. Or, conversely, maintaining the traditional canon because it's easier to forget other traditions than to make an honest effort to investigate and incorporate them. Purposeful lies might be evil: deliberate racism, sexism, ethnocentrism and the like; but what I really mean is the suppression of ambiguities and nuances that would over-complicate the curriculum and bewilder the student. It is, for example, better to tell the students that there was a Rebirth of Classical Ideals, a Renaissance, than to bring it into question with equally valid demonstrations of medieval continuities in almost everything.

I've said "we" are liars, but of course I'm speaking of myself, because this essay is about my redesigning a freshman humanities course and about my awareness of the compromises, omissions and simplifications that are entailed in planning a responsible, attractive course. The nature of the course that is being replaced will emerge as I proceed, but briefly, here are some significant administrative details. The old course was mine alone, three credits per quarter. The new one is four credits per quarter, and new scheduling allows for Tuesday-Thursday two-hour sessions, making possible the use of feature length films, discussion in a variety of modes, in-class writing and so on. No longer a one-man show, our department will divide and share the duties, and we intend to build program flexibility into each quarter to allow for different styles and preferences. Moreover, we are thinking of enlarging the offering into a core curriculum course for liberal arts majors, incorporating writing training.

What I address here, though, is simply the question of introducing global diversity into one of the most important bodies of knowledge that is inherently European, masculine and elite. In redesigning this course, I have several principles to adhere to. The first is that although this is the middle part of a three quarter-term course, it should have its own unity of a beginning, middle and end. It should, though, also refer to topics and threads of thought from the previous quarter and foreshadow such themes of the following term. The second principle is the use of primary sources, or rather what we loosely call primary sources—cultural artifacts in translations, reproductions, excerpts—rather than books *about* such artifacts. There will however be a departure from this personal prejudice, because we have decided to use a world history handbook as a supplement throughout the year, particularly as a bridge for the periods that we vault over. The third principle really is stylistic, because I compose my courses like personal essays, or a play, with by-ways, nooks and musings that don't reveal their interconnectedness until the end. It's sort of a curricular keep-away that is not congenial to all students.

As to "globalizing," I also self-imposed some principles. The first is to avoid tokenism, that is, merely salting the mine with ethnic nuggets. The second is to avoid the standard approach to non-European or non-Western world histories and art histories of adding a chapter or two at the end (the coyest approach I've seen recently is to put this otherwise unrelated chapter *first*, so we know it's not really a token afterthought). A third principle is to avoid sentimental liberal lies, the sort of thing that propounds that Muslim women have greater equality than Americans because the Koran protects women's property rights, or one I heard some years back from an earnest teacher that there was no warfare in America until the white invasion, or, at a much more scholarly level, the Metropolitan Museum of Art's magnificent 1990 exhibit "Mexico: Splendors of Thirty Centuries" which managed not to mention one of the most salient features of Meso-American culture that is essential to understanding much pre-Columbian art and architecture, *viz.*, human sacrifice. A fourth principle of globalizing is not to throw the baby out with the bathwater; this *is* a course about the European Renaissance and its ideals that contributed so much to the modern world *globally*. So, from this, it will be seen that the challenge I set for myself is one of integration.

One possible approach that I rejected was to define renaissance as a cultural period of efflorescence in any society, a Golden Age, if you will, so permitting comparative renaissances of Lorenzo's Florence, Kublai Khan's Shangdu, Atahuallpa's Cuzco, et cetera. It's a good approach, and I've taught a course called "Urban Images" that did something like this, but for this case I rejected it out of hand because it would produce a different kind of course, one that would downplay the seminal importance of the European renaissance.

The approach to integration that I took was to slightly redefine the term *renaissance*. In the year-long course we are replacing, renaissance was defined in three broad concepts: classical revival, the Renaissance Person and Utopian thought. Each was a primary theme for an academic quarter, and the last, utopia, was extended to mean human perfectibility, allowing a fairly extensive section on religions of India. The necessary redefinition needed for revising the course was actually contained in the syllabus for the "Renaissance Person" quarter, the definition of having "*a combination of ambitions for cultural versatility, for individual self-fulfillment and expression, and for exploration of the limits of nature and of human potential.*" So there it was on a platter: *exploration.* The Renaissance, as we all know, was also the Age of Discovery. I knew it, but in the old course, I ignored it, because the "exploration of the limits of nature and of human potential" that I chose to emphasize were the space exploration of Brunelleschi, Piero, Alberti and Galileo, and the limits of human potential in Dr. Faustus. How much of this I'll keep in the redesigned course remains to be seen, but interconnecting lines are clear from Piero and Fra Luca Pacioli in the court of Urbino, to Toscanelli and Columbus.

In the back of my mind, though, was a passage from Albrecht Dürer's diary of his trip to the Spanish Netherlands. On August 27, 1520, he wrote:

> I also saw the things which have been brought to the King from the new land of gold, a sun all of gold and a whole fathom broad, and a moon all of silver of the same size, also two rooms full of armour of the people there, and all manner of wondrous weapons of theirs, harness and darts, wonderful shields, strange clothing, bedspreads and all kinds of wonderful objects of various uses, much more beautiful to behold than prodigies. These things were all so precious that they have been valued at 100,000 florins. All the days of my life I have seen nothing that has gladdened my heart so much as these things, for I saw amongst them wonderful works of art and I marvelled at the subtle Ingenia of men in foreign lands. Indeed I cannot express all that I thought thereby.

From this, deep in my soul, I knew that finally I would be focusing to some degree on Mexico and the encounter of two civilizations, but I set forth on more extensive reading on renaissance exploration, in search of usable and available primary source material that might capture the imaginations of college freshmen, and possessing sufficient humanistic depth to stand along side writings of Leonardo, Thomas More and Galileo. At this point in my research, I had not yet settled on whether to take a broad global view, that is to say with several alternative cultures, or to select one to explore in some depth. It is, of course, a difficult decision that ultimately requires the kind of compromises I have characterized as "purposeful lies."

I began my search for material with some secondary sources that I heartily recommend to any humanities teacher as a model for comparative culture history. This is the new Time-Life book series called "Time-Frames." Each volume takes a time period—in early history, several centuries; in recent history, half-centuries—and focuses on three or four regions, often with surprising and illuminating commonalities. I won't bore you with book reports, but for a while I concentrated on chronicles of Portuguese explorations in Africa and India, and I'd like to share two tidbits that were surprises to me. One was, that upon rounding the Cape of Good Hope, the Portuguese had no problem communicating with Africans and Indians because they knew Arabic, the Moors having only recently been driven from Iberia, and Arabic being the lingua franca of the Indian Ocean. The other tidbit is that the Portuguese commissioned the artisans of west Africa for carvings and woven goods that made their way into the collections of Renaissance connoisseurs, and in the case of a Congo rug, right into the home of the Virgin Mary, in an Annunciation painting! Black Africans had been known to Europeans for centuries: There even was a black Crusader, and quite authentic depictions of blacks show up in paintings of the Gifts of the Magi. True, European exploration of the African interior waits until the nineteenth century, with only fantastic legends to substitute for direct observation, but through Egyptian and Arabic trade routes the African connection was virtually unbroken from ancient times. So the African encounter was a real possibility.

The New World was a different story. For how different, I turn to Octavio Paz's elegant and perceptive introduction to the sumptuous catalog to Metropolitan Museum's Mexico Exhibit (which unlike the exhibit, *does* discuss human sacrifice):

> In {the Indians'} mental universe there were only two categories for classifying human beings, barbarians and civilized. The Spanish were neither. The Meso-Americans were ignorant of a reality entirely familiar to peoples of Asia and Europe: the existence of other civilizations. . . . To deal with the unknown, they had but one special category, the sacred. . . . Not another civilization, but other gods. . . . *Otherness* is a constituent dimension of historical consciousness. He who is without it is defenseless before the new and strange. (p. 20)

In short, for Cortes, this was *another* exotic civilization; for Moctezuma, it was a *first*. Nevertheless, by 1500, Renaissance Europe knew that this was a new world, and it fed their imaginations. Regardless of how much Sir Thomas More's *Utopia* was informed by Plato's *Republic*, it was *inspired* by the reality of a new world, and we must remember it was written before Cortes had found a new civilization, whose arts were so to astonish Albrecht Dürer. There's depth here, and connections with Renaissance masterworks that need not be contrived. Moreover, the intercultural encounter is one of the most intense and dramatic stories of all history. We know this because of the primary sources of eye-witnesses and participants on both sides. The accounts of Cortes and Bernal Diaz del Castillo are thrillers. Had Machiavelli been able to hold off *The Prince* for seven years, he might have found a different heroic model than Cesare Borgia in the person of Cortes. The psychology of Moctezuma is such that it bears comparison with Shakespeare's Richard II.

But what finally persuaded me to focus in some depth on Mexico is the abundance of literature of the Aztecs. As you may know, the Aztecs (like the Mayans) were not illiterate in the same sense as North Americans and Africans were. They also had a powerful feeling for history, not only mythic and legendary, but chronological history. One of the disasters of the conquest is that most of their books were destroyed, but Aztec artists were trained to make drawings of events (Moctezuma sent artist-reporters to the Gulf coast to bring him pictures of the visiting gods), and, through the humanistic interests of churchmen, artists drew pictures and described them in Nahuatl, which was then translated into Spanish. Fortunately, an edited version of some of this is available in paperback: *The Broken Spears: The Aztec Account of the Conquest of Mexico*. But unfortunately, a beautifully reconstructed autobiography of a pre-Columbian Renaissance Person is out of print. He is Nezahualcoyotl, King of Texcoco, who lived from 1402 to 1472. Frances Gillmor, an anthropologist and folklorist, worked from a variety Aztec codices (mostly from thirty-five to seventy years after the conquest) in her scrupulously footnoted "autobiographical novel" *Flute of the Smoking Mirror* which tells the life-story of this:

> . . . . only poet on the American continent whose name comes out to us from the pre-Columbian mists. He was an engineer. He codified Aztec law. He established a commission of arts and letters which held regular meetings to pool information, to teach, to award prizes for artistic achievement and punishment for poor craftsmanship to musicians and poets, to goldsmiths and feather-workers.

In addition, as a youth he was a hunted fugitive from rival kings, a superstar on the ball-court, and something of a sexual athlete. Sometimes cruel and unscrupulous, he erected a temple to an abstract god, with no idols and therefore no need for sacrificial blood as was needed for the more corporeal pantheon of nature gods. Nezahualcoyotl is a Mexican hero; it is clear that at the time of the conquest, only fifty years after his death, he was already of legendary stature, but even allowing for apocryphal embellishments, he is a historical king of many talents, not a legend from once-upon-a-time. In short, there's god's plenty in Mexico, with direct connections to many other aspects of the European Renaissance, and therefore a high potential for true integration rather than tokenism or a "ghetto" add-on.

There are a variety of ways to produce an integrated interdisciplinary course. One way is the integrating *problem*, such as I use in a Black Heritage course, where the problem is: Suppose you are a black artist (literary, musical, visual, etc.) from Africa, North or South America, and you choose or practice black art, what is the heritage that you can draw upon? What emerges, as you can imagine, is an incredibly rich heritage and a sympathetic context for understanding black aesthetics and the black experience.

Another way of producing integration is the *extended definition*. The term to be defined cannot be chosen lightly, for it should have sufficient ambiguities, ramifications, applications, expressions and human significance to require an extended definition. 'Renaissance' is certainly such a term, well deserving a ten week long definition by way of examples from literature, political thought, educational theory, art, architecture, science, biography, and by way of contrast with the medieval world that preceded it and with the new worlds it discovered.

Finally, the full name of the course is *The Renaissance and Its Legacy*, and so there is a final purpose to suggest to students the meaning of the Renaissance to the Twenty-first century and to themselves. It is a rich and terrible legacy of individualism, arts, high technology, environmental exploitation, nationalism, global politics and economics, racism, schemes for perfecting social systems, the explosion of information, and the brash faith that even the sky is no limit. And that's no lie.

TEACHING TRIALS

RATIONALE

Bringing a trial from the courtroom to the classroom presents endless opportunities to study a significant and powerful event, the action of an individual being judged by society. As an intellectual force, the trial has served as a bridge between art and reality; it is myth in the making. The world of the trial is a coherent, interconnected universe, a living artifice.

For virtually everyone the judicial or jury trial is a thrill, a drama in the courtroom. It is a moment of suspense, where the love of conflict, the tension of an undecided matter, the tug of war between good and evil, the quest for truth in conflict with the compulsion to victory, force one to give absolute attention to an issue. The exercise of state power inherent in the procedure and the possibility of a horrifying outcome mix the underlying strain with a note of terror. During the process, its participants rise beyond the personal, to mythic simplicity, losing any concern for inconsequential detail.

After the relief of decision, there is a new vantage. Everyone jumps into the fray, examining, weighing, probing. As the trial is untangled, what seemed simple unravels to reveal endless complexity. The process, the personae, the philosophies, ephemeral matters and eternal questions can be explored to engrossing depths. For a time nothing is too unimportant to be ignored. At this point, even trivia have the potential for generating fertile insight.

Nearly every field in the social sciences, arts and humanities has dealt with courtroom trials, civil or criminal. Their form stirs the imagination, raising the challenge to make something of them. Social scientists and humanists closely examine trials, each from their own perspectives, each bringing to the study assumptions and concepts prized by their disciplines. To the social scientist the trial and its analysis represents and reflects the essence of social activity, showing social conflict, the clash between the individual and the system, the class, the nation or the society as a whole. A psychologist focuses on an individual accused of malfeasance, examining intent, motive, excuse, understanding. To the philosopher, at the heart of the theme of wrongdoing lie notions of social values and moral conduct, issues of right and wrong, and questions of the nature of intention, action and meaning. Historians find themselves concerned with actions and relationships, the stories of events, of people, and the analysis of connections, with the careful study of documents. All inquire as to truth and justice.

Writers and filmmakers have been drawn to great historical trials, particularly when there appears to have been an egregious injustice. Socrates, Joan of Arc, Galileo, Sacco and Vanzetti, have been tried and retried on stage and screen throughout the world. Using original transcripts and other sources, artists have created new visions of grand historical figures standing strong, self justified, innocent before powerful accusers.

Institutional wrongdoing is not the sole attraction of the courtroom setting to the artist. Focus on the process itself is as intriguing and absorbing to the creator as to the scholar and the critic. Dramatists, raising questions of motivation, purpose and meaning, also use the trial as an opportunity for showing the character in court revealing, explaining and justifying. These protagonists attain epic proportions, transforming themselves into myth and symbol.

Similarly, creators of popular fare, weekly dramas or mysteries and television mini-series find enormous resources in the courtroom drama, both fictional and historical. Some of the most popular shows have been devoted to the lawsuit, its troubles and tribulations: *L.A. Law*, *Matlock*, *Perry Mason*, have enthralled viewers as they educated them. Devotees of the video courtroom closely monitor the exploits of their defense attorneys, their prosecutors, their rules of evidence and procedure. In *L.A. Law* the creators' sense of the gripping nature of the trial gives no guarantee to the audience as to the outcome of the contests they present. Unlike the shows named for the always victorious defense attorney, *L.A. Law* concedes that either side's powerfully convincing arguments might lead to victory.

For everyone, high and lowbrow, observer and participant, the trial formula works a magic not reproducible in any other context. It is an unscripted ritual with which all are to some degree familiar, participants in the unfolding and making of myth. Though it is a public ceremony, the trial is made coherent by the actions of private individuals. Everyone knows what to expect, yet each has the power to take something new and special from the situation, and at the same time to create surprises for the audience and for the other participants. Therein lies the great potential of the trial form for the classroom.

THE COURSE

Recently I designed and taught a course in which selected trials were linked by history, film, literature, law, and student activity in mock trials. Students viewed and analyzed films, read literature, perused and evaluated transcripts, watched television drama, and digested a miscellany of handouts from historical and documentary sources. They acted as prosecution, defense, witness and defendant. I lectured on historical, literary and social science background, instructed on ways to read a play and critique a film, and, using my experience as attorney and Judge *Pro Tem*, demonstrated techniques of conducting a trial.

All of these provided bases for discussion and stimulants to the student imagination. The use of film and literature in conjunction with popular pieces evoked strong response. Television rarely attains the heights of literature, but our students are mediawise, as familiar with TV characters and situations as a Shakespeare scholar is with her Lear. Courtroom theatricality, whatever the content, awakens them to intellectual activity.

Trial allows for "argument live": asking questions, discovering and defeating points, dealing with unpredictable witnesses, reacting to unexpected turns in the logic of the case. Argument is fun. Since people don't ordinarily permit themselves the freedom of vigorous debate, they enjoy the chance to criticize and to challenge, to take pot shots, to struggle to make the last detail relevant, to advocate. They feel a special thrill about advocacy in this ritual and formulaic context. The obnoxious, the elegant, the excessive, the bombastic, are all understandable and enjoyable, all forgivable.

An abundance of historic trials from every continent and nation, every period of history, compelled careful selection. Because I wanted to weave interdisciplinary objectives with other ends, the showing of a variety of types of trials, coverage of several periods and different jurisdictions, and the introduction of key "defendants" whose trials continue to fire the imagination, the process became quite complex.

Working with a theme brought lists into focus. I linked a group of apparently unconnected trials to create a powerful conceptual link which was intellectually interesting, emotionally moving, and morally ambiguous. I wanted a topic that would stick, that would drive the students to ask questions and raise doubts long after the course had finished. As important, the focus I selected had to fascinate me, to allow me to be a student in my own course.

I chose the theme of the trial as *ordeal*. The experience of ordeal was not only that of the defendant, but of the prosecution as well. Both accused and trier were on trial. The meaning and function of testimony were equivocal. Defendants were called upon to answer for themselves in the context of the hearing, but also testified and stood up for the sake of principle and spiritual obligation. Issues of innocence and guilt, morality and venality were blurred. Among the defendants I selected were Socrates, St. Joan, Standing Bear, a Ponca Indian chief who challenged the U.S. government's power to hold him prisoner, Jackie Robinson, who refused to submit to the U.S. Army's policy of racial segregation, and the Chicago Seven. I also asked the students to read Bertolt Brecht's *The Caucasian Chalk Circle* which continued the thread of ambiguity in its image of the judge, Azdak, who used power arbitrarily to do good, punish evil and right wrongs.

These accused were not simply lawbreakers brought to bar by the state. They were persons who were being tried for actions stemming from their very natures, for example, Socrates for his lifetime of ironic inquiry and search for truth, Joan for the conviction and imagination that drove her. These, unlike ordinary criminals, could have stopped at any time. They chose to be tried. The list included a variety of types of trials, from different periods

1627

and jurisdictions, famous and little known. The Trial of Socrates in ancient Greece presented interesting options in terms of procedure and the structure of the jury. Joan was tried before Churchmen, Robinson before a military court. Standing Bear was not accused of anything. Using the petition for a writ of *habeus corpus*, he sought to prove to the U.S. government which had arrested him to compel him to return to Indian Territory that he was entitled to his liberty. The trial of the Chicago Seven illustrates the equitable powers of the judge in Anglo-American courts, particularly the contempt power.

THE MOCK TRIALS

Mock-trial segments were linked to each historical selection. Such trials have been used by political moralists, Bertrand Russell, for example, to educate the public as well as the participants. They have been held in various countries to make an historic or political point, often about the failure of legal systems to protect human and personal rights which appear to transcend local or regional interests or powers. Questions of war, the building and using of massive destructive weapons, environmental waste and devastation and the wanton taking of life, have been debated in internationally based mock trials.

In the classroom mock trials have another impact. As students actively sift data to build their cases, they become radically committed to the project and to the characters. The become part of the process; they are the process; they identify with, in a sense become the characters. Rather than learning in a linear manner, they are finding information and materials as needed, in a context which they have created. They do not simply take a story from beginning to end as someone else has ordered it. They move in and out of the texts and sources, becoming dedicated to shaping their own conceptions from what they have before them. As the students order and structure the activity, they take control of their learning. This process leaves them invigorated, making the material part of their thought as no other approach can.

Of the alternatives for the student mock-trial experience, three seemed most workable. We might have selected actual historic trials and using the court record, replayed them defining new approaches and searching out previously unadmitted evidence. Or historic figures whose actions have raised great controversy might be put in the dock. Finally, we might have selected mythical or literary figures whose conduct has raised significant questions of ethics, morality, or propriety over the centuries. From the propadeutic perspective, it seemed to make little difference which method was chosen. In each, the figures took on a grand and mythic stature, simplified to retain only their most significant and characteristic qualities.

Each approach presented useful opportunities and difficulties. Actual historic trials, widely described, fictionalized or depicted in film might excessively influence students' choices and perspectives. On the other hand, the large body of materials usually available would make such a retrial quite fruitful. There would be opportunities to discuss strategies, to analyze characters, to evaluate logic, to redo appeals to the jury, and to reconsider issues in light of changing law. The second method, trying historic figures who never appeared before any tribunal for actions still debated, seemed to prevent the problem of excessive influence. Students would have the chance to gather fresh materials on both sides of a question. Yet, this kind of trial would demand a large time commitment of individual and group work. It would not make sense to require participation in more than one, given the rest of the workload. On the assumption that trial skills, particularly proficiency in evoking information to support a point of view, ability to refine issues, and intellectual sensitivity to nuances would increase with each project, I wanted at least three mock-trials.

The third path, using a mythic figure, seemed to satisfy many requirements. The heroic character though submerged in controversy did not have endless documentation and irrelevant detail associated with it. Accounts of the myth were usually succinct. Such a figure could be tried so that students would be free to use all their intellect, imagination and knowledge in structuring the trial to deal with the central issues. Further, this approach permitted flexibility for the instructor. I could select myths linked to the key trials of the course. The choice of the mythical figure also allowed me to use works of literature which students may or should have encountered in other contexts, or which they surely would encounter in the ordinary cultural life of the city, adding to their underlying general cultural knowledge. In a sense, my dream was to make Electra or Faust as ordinary a household figure as Perry Mason.

Ultimately I decided on three mock trials, two of mythical figures and the last a trial of a single historic personality. To add to the richness of the experience I selected three whose actions and natures were contrapuntal to the trials studied. Orestes, Faust, and Joseph McCarthy would stand before the bar, required to account for themselves. Each committed actions which required explanation, forgiveness or excuse. The three were driven, but for ends that were private, personal, even demonic. Their deeds and values compelled their society to reflect upon itself, and in that sense, they challenged the community at large, leaving doubt, uncertainty and ambivalence. But they lacked the appeal or moral standing of the main trial figures. Thus their defense and prosecution took on a different quality. Students could explore the ways in which the accuseds' images were shaped. What could be said to affect the ways in which we saw and judged Joan or Faust? In each of the cases the defendants did a great deal to explain themselves. What help did they need to explicate their position and to justify their actions?

Procedurally, the mock trials were intertwined with the historic ones. Following the trial of Socrates, I provided the class with the "Orestes Trial File" which contained the family history of Agamemnon and his children and wives going back to Pelops. This included a "Personal Detail" for all members of the family, the stories of curses, lovers, murders, but concentrated most directly on the Agamemnon-Orestes story. I informed the students that there was additional information in various plays, stories and operas, from which they could draw if they wished to expand the defense or prosecution.

Adding to everyone's pleasure, during the class trials of Orestes, Strauss's opera *Elektra* was performed at the Los Angeles Music Center. Several students brought in reviews of the performance and were very excited that "their case" was on view locally. In New York at the same time, the Metropolitan Opera presented both Hofmannstal's *Elecktra* and the Strauss opera, and the class followed the performance. Students stated they knew these characters personally, and now took a special interest in their affairs and reputation.

Goethe's Faust character was the second mock defendant. Now the students were more adept and confident. Skills from the Orestes mock trial and the study of Joan, Standing Bear and Socrates were refined in this second endeavor. Students had hands-on experience in developing a point of view, in using evidence to support a conclusion, of gathering material to strengthen advocacy, and using logic to deal with and defeat an opponent's point. They learned the relevance of literary perspectives to the art of judgment and decision-making. So many Faust stories and possibilities, so many Orestes stories and possibilities, widened their cultural as well as their litigation perspectives.

The highpoint of the mock trial series was to be the trial of Joseph McCarthy, who had been judge, jury and high priest. Sources were plentiful. McCarthy had appeared on television. The Army-McCarthy hearings were televised and available with hearing transcripts in our library. Theatrical analogies to McCarthy's work were abundant, and were performed in the city. Films were made about the general subject, including *The Front* and *Guilty by Suspicion.*

McCarthy had been the subject of much hyperbolic indictment. Now he was a defendant in a formal tribunal where fact and clear argument would be pitted against innuendo and excuse. Students prepared to recreate the characters of Joseph McCarthy, his cohorts and opponents. The success of this final project was determined by the students' remarkable energy and involvement. With a month to set up this project, they searched everything: literary sources, news reports of the time, video footage, newspapers, history books. They were free to pull all stops: write letters, sign documents, create testimony, and did so.

Abundance of materials produces its own difficulties. Because the teams shared discoveries only to a limited degree in the early stages, the documentation uncovered by one side sometimes overwhelmed the other. Limiting the topics by the judicial fiat requiring that the prosecution clearly state the charges and present the defense with a list of witnesses in part solved the problem. Still, a post mortem revealed that students would have preferred a circumscribed body of materials shared by each side to prevent surprises. From my perspective the open ended research was enormously productive and interesting as it allowed individuals to find angles for analysis, and to frame for themselves the crucial points and themes.

To my delight and surprise, in each of the mock trials, students asked for recesses, and moments to confer and plan strategy. As I listened to these discussions, I found them reviewing and considering the impact of witnesses' testimony on their cases, and poring over the texts and materials for evidence of character and intent that might be useful in impeaching witnesses or bringing out further evidence. During the second and third trials, this process of assessing, evaluating and planning became increasingly intense once the students had become comfortable with unscripted role playing. They were in fact writing the script as they proceeded.

Each mock trial was originally planned to last two class sessions (one hour and fifteen minutes per session). But in the Faust trial, students found that they needed another full session, a pattern later followed in McCarthy. When the trial was adjourned after the first round, they left the classroom preparing to scour their materials for this point and that, to document an assertion or to rework their plan of attack. During an ordinary lecture discussion class I could not have created so much voluntary return to text.

Legal background is not necessary to carry on this course, as mock trials need not be held to contemporary courtroom rules of evidence or procedure. Rules of procedures can be established by the class, using ordinary awareness of court process. As in my course, trial structure can be set in a time-warp, with no historical limitations. Key objections allowable may be fairness and relevance, concepts which underpin any legitimate court process. These limitations give students room to move, to argue and to discuss as issues arise. They allow any instructor to teach such a course using common knowledge.

UNANTICIPATED CONSEQUENCES

To reinforce these experiences, I videotaped each of the trials, and then played them to the class. After students' fascination with their own performances ebbed, they concentrated on what they and their fellow students might have done better. How might speaking skills have been improved? How might argument be strengthened? How might a certain description be enhanced? How better might evidence have been adduced? Should they control the information their witness released? Could a lying witness be detected? What choices did the artists and historians make? Were there alternatives?

Accidentally the video taping raised the issue of audience. These trials had no outside viewers other than the young cameraman. One day, at the end of the Faust trial, in which students continued to argue for a long time after the class, he admitted to them that he had favored the defense. When asked why he had not said something, he responded that they were so involved in what they were doing, he became anxious that they might bring him into the trial as a witness.

The videotaping originally was planned as a record to allow me to evaluate the project. But as the shooting proceeded, possibilities of a new project emerged.

I am editing the tapes of these trials to make a single film. The students will then have material evidence of their participation and growth, as well as something to bring home. They can study these at their leisure to learn more about their own thinking processes. Tapes will be available for educators who wish to use them as exemplars for this type of course, or to show in other settings such as courses in critical thinking or social science.

The trial format offers endless remarkable options and opportunities for instructors in every area of the social sciences and humanities. The mock courtroom was a simulated, protected world where students experimented with roles and levels of consciousness and awareness. As instructor and participant, I believe I learned as much if not more than the students about the materials, my thinking processes and theirs, about structures of teaching and learning, and about the possibilities of using the mock trial as a nurturing ground for many kinds of university classroom activities.

FILMS/VIDEOS

The Trial of Socrates, BFA Educational Media (distrib.)

The Trial of Standing Bear University of Nebraska

Joan of Arc Faucett Multimedia (distrib.)

Conspiracy HBO, based on a play by Ron Sossi

The Court Martial of Jackie Robinson, HBO

Inquiries regarding distribution of the completed video film of student mock-trials may be sent to American Media in Academe Institute, 1327 Palms Blvd. Venice, CA 90291.

HANDOUTS

There were critical to the class since there is no collection of transcripts for my cases. For the trial of Joan, I selected Scott, 1956. For the case of Standing Bear, I circulated Judge Dundy's opinion in *U.S.ex rel.Standing Bear v. Crook* 25 *Federal Cases* 695-701 (Cir.Ct.D.Neb.1879).

ANNOUNCEMENT

In January, 1992, the quarterly journal of The National Association for Humanities Education will change to

INTERDISCIPLINARY HUMANITIES

Editorial policies and format will remain as they are.

We are planning two special topical issues under the new title: see pages 12 and 32 for calls for articles on "Music and the Humanities" and on "Beyond the Quencentenary."

HUMANITIES EDUCATION
ABSTRACTS & REVIEWS

Summaries of significant reports about interdisciplinary humanities education.

---

100 MOST

Doug Estell, Michele L. Satchwell, and Patricia W. Wright, *Reading Lists for College-Bound Students: The Books Most Recommended by America's Top Colleges*, Englewood Cliffs, NJ: Prentice-Hall, 1990. 256 pp. (pap) $8.95. Reviewed by Charlotte Templin, University of Indianapolis.

Doug Estell, Michele L. Satchwell, and Patricia Wright, the high-school-English-teacher authors (from Carmel, Indiana) of *Reading Lists for College-Bound Students: The Books Most Recommended by America's Top Colleges*, wrote their book for students who asked, "What books do I need to read to prepare for college?" The volume could attract a large audience, judging from the responses of college and secondary teachers I know—all the individuals I have shown the book to have become engrossed in it at once. It will be of particular interest among professors caught up in the controversy over canon restructuring. At the heart of the book is a list of "The 100 Most-Often-Recommended Works," a compilation based on responses by 103 colleges to the authors' requests for lists of recommended reading. Also included in the volume are the original lists (some apparently reading lists for freshman humanities courses), along with introductory material listing the benefits of reading: the familiar litany of the English teacher—vocabulary building, improvement in writing ability, success in college, and self-knowledge.

A response to the book must take up the problematic of "best" and "top." Though the authors talk, not about "best" books, but about those "most frequently recommended," there is an implicit suggestion that the composite list reflects what American colleges agree are the important books. Many curriculum reformers are against the idea of any list. High school readers, who will presumably take the book's bourgeois gospel to heart and read it in the spirit of self-improvement and quest for success implicit in the project, should be cautioned against accepting a compilation such as that found here as a definitive list—"the list" recommended by America's colleges. One hundred and three colleges are, after all, not many, nor is the basis apparent for calling these particular colleges, who happened to answer the authors' queries, America's "top colleges" (though some illustrious names are included). The list of the 100 most frequently recommended titles will be a fascinating study for students and humanities instructors, but the volume has another, perhaps even more important, value: that of introducing students—through the 103 individual lists—to many titles they may not have heard of.

Some readers will applaud the traditional bent of the lists; others, who wish to see an "opening up" of the canon, will be disheartened by the fact that these lists suggest that the traditional canon is still very much in place. Judging from these lists, feminism and black consciousness movements have not yet had a great impact on the canon.

Analysis of the lists reveals a number of noteworthy things, including a lack of attention to twentieth-century literature, especially poetry. There is in fact little poetry on the lists if one excludes the epic and the verse drama, probably owing in part to the prejudice in favor of book-length works implicit in the idea of a booklist. The prominence of English literature in the hierarchy of national literatures is evident. While English literature dominates many lists, some universities include only classical writers from Aeschylus to Vergil (George Washington, Davidson College of North Carolina, Hillsdale). Barnard sent a bipartite list, half British and half Greek and Roman classics. Very much in evidence are highly traditional lists of English and European classics, along with a handful of indisputably canonical Americans, e.g., Faulkner, Hawthorne, Thoreau (Alabama, Montana State, Mt. Holyoke, Smith, Ohio State, Presbyterian College in Clinton, S.C., U.C. Davis, Butler University of Indianapolis, Indiana—where the largest single category is the medieval romance). Four institutions deserve special mention for diverse and stimulating lists: Brandeis, Marquette, Wright State (in Dayton, Ohio), and Vassar. These lists do justice to the traditional canon and at the same time include a variety of modern and contemporary works. Thus on the Brandeis list we see Tillie Olson next to Nietzsche, and on the Vassar list we see Salman Rushdie next to Shakespeare.

Women and minorities are present on the lists, but not in great numbers. On the composite list are six black Americans and no other writers of color. As a feminist I am troubled by the paucity of books by women writers. One hundred and nine names appear on the composite list (names beyond the first 100 are poets singled out for special emphasis in an annotation of a most-recommended volume of poetry). Of these only seventeen names, or fifteen per cent, are women. Those who follow the subject of women and the canon know that figures of between 10 and 15 percent keep popping up as percentages of space allowed to women in anthologies and curricula. One is prompted to ask whether there is some unspoken quota system at work. On the bright side, however, the appearance of women such as Kate Chopin, Zora Neale Hurston, Toni Morrison, Tillie Olson, and Alice Walker on the composite list, plus many others on the individual lists, would not have been possible without the feminist movement. Women writers most popular with the establishment, based on these lists, are Jane Austen, whose name appears 48 times, according to my count, and

Brontë, who appears 31 times. Brontë's prominence may be accounted for by the fact that she, like Plath (whose name pops up intermittently on individual lists) and Dickinson (who appears on the composite list), is seen as the madwoman or eccentric so often chosen to represent the female writer in a male-dominated literary tradition.

Estell, Satchwell, and Wright's book provokes a number of different emotions, for various reasons, but it never fails to interest. A good read for English and other humanist professors, it's guaranteed to stimulate discussion in the corridors and coffee rooms of academia.

CANON FODDER

"Distinct Models: Why We Teach What We Teach" by R. V. Young on *The Inter-Collegiate Review* 26:2 (Spring 1991). 14 South Bryn Mawr Avenue, Bryn Mawr, PA 19010-3275. $10/four issues.

Emily The canon of humanities is under attack, as we all know. The adversaries are numerous. There are important defenders of the canonical Great Books; there are many moderates who are working to incorporate alternative, fresher and more varied viewpoints without destruction of the classic core; there are strident minority voices who would like to replace all the rascals with a new curriculum; and there are those whose disdain for the canon is based on the idea that there never have been any Great Works.

It is these last that Young, who teaches at North Carolina State University at Raleigh, opposes. He maintains that these are the "revolutionaries who currently dominate academic discourse in the humanities," and he particularly identifies Stanley Fish and his cohort at Duke University as villains. Drawing upon statements by several of them, Young says that the essence of their critical school is that "textual objects" are "inherently nothing." The only importance that works have is what critics do to them. The interpretation is what matters, not the subject of interpretation. "Under this new interpretation, then, neither *The Scarlet Letter* nor *The Scarlet Pimpernel*, neither *The Color Purple* nor *Riders of the Purple Sage* has any intrinsic significance; indeed, they only exist as a result of the critic's conjuring."

Young is firmly in the camp of Matthew Arnold and Cicero. There *are* great works that can be the best models for contemplation, imitation and assimilation. These should be central to liberal education. But there are also justifications for also using less-than-great works. Young's examples are all literature (indeed things that have been in standard American anthologies for four decades), but they can serve the purpose of helping students to understand the historical societies and political, religious, etc. issues that were the environments surrounding the masterworks (which nonetheless *can* still stand alone). (F.S.)

MULTIPLE PERSPECTIVES

"Getting Beyond the Criticism of History Museums: A Model for Interpretation" by Thomas A. Woods in *The Public Historian* 12:3 (Summer 1990). University of California Press, Berkeley, CA 94720.

Telling the whole tale about an historical period, place, event or person is a challenge that all humanities educators face at some time or another. In this article, Woods, who is director of the historical sites for the Minnesota Historical Society, is specifically addressing museums, but much of what he says might be adapted for various classroom settings, including research-writing exercises.

In recent years museum interpreters and educators have become possibly the most self-critical practitioners of interdisciplinary learning. Especially in "living history" exhibits, they are constantly being plagued with dilemma-horns: too popular/too dull; too simple/too obscure; too elitist/too mundane, are only some of the attacks that Woods summarizes and footnotes fully in the first five pages of the article. After this, though, he proposes a multi-perspective approach to interpreting the raw data of history—in a museum, the material artifact—which he calls "inductive, perspectivistic interpretation." The goal is to transcend the typical obsession with the accurate historical description of objects to where we "analyze the cultural significance of those artifacts critically." He draws on several models, such as anthropologist Clifford Geertz' distinction between "thick" and "thin" cultural interpretation. A "thick" example is Kenneth Ames interpretation of a Victorian hall stand, "a meaningful object that represents social relationships between individuals and classes of individuals."

For multiple perspectives, Woods modifies Fred Schroeder's "seven ways of reading artifacts" to move from simple and concrete to the complex and abstract. Another source is Gene Wise's idea that historical experiences (all human experiences) are viewed from "frames of reference," both socially and personally. Thus, an event, artifact, task or whatever is experienced differently by a young woman, an old man, a freed slave, an Irish immigrant. Literature has experimented with this—Woods mentions Lawrence Durrell's *Alexandria Quartet*, but one can also think of Faulkner's *The Sound and the Fury*. Thornton Wilder's *The Bridge of San Luis Rey*, E. M. Forster's *A Passage to India*. Such multiple frames of reference can be used in exhibits, too, to get at the complexity of whole meanings, as Nick Westbrook and Carolyn Gilman did in a Great Lakes Fur Trade exhibit at the Minnesota Historical Society: "Gilman combined artifacts with oral histories. . . to show how Buffalo Bird Woman, her brother Wolf Chief, and her son Edward Goodbird all responded differently to the changes in their lifestyles."

Finally, Woods suggests using "the varying perspectives of scholars who disagree on the interpretation of the past." All in all, this article provides an arsenal of techniques that can take our understanding of the past far beyond identification, description and authoritarian interpretation.

RECYCLING UNIVERSALS

"Scientific and Ethical Beliefs: The Rutherford Model of the Atom and the Constitution of the United States" by Charles M. Wynn, Sr. in *Perspectives* 20:3 (Winter 1990). Association for General and Liberal Studies, Penn State York, 1031 Edge-Comb Avenue, York PA 17403. $30/yr.

A cunning interdisciplinarian can probably find connections between any two things, but the atom and the U.S. Constitution seem a bit distant from one another. But Wynn, who teaches chemistry at Eastern Connecticut State University is using these examples to get at the question of "what are the natures of scientific and ethical beliefs?" He begins with a brief explanation of the idealized scientific method: observations whether predictions can be made and supported by experimentation, and "recycling" hypotheses that do not bear out the prediction. Recycling can either mean modifying or discarding the failed predictions.

His example is Lord Ernest Rutherford's belief in the atomic model of Sir J. J. Thompson. Rutherford performed an experiment that should have had a predicted outcome, but didn't, so he recycled into a new model, which since has been further modified, and may be again, for "beliefs in scientific hypotheses are tentative by their very nature."

One of the chief differences between scientific and ethical beliefs is ethics is concerned about what *ought* to be. Scientific laws are descriptive; ethical laws are prescriptive. But a similarity is that both strive for the simplest statement (we're thinking of the Constitution, not tax laws!), and both are "meant to be as general as possible. Rutherford's model should apply to all atoms; the Bill of Rights should apply to all American citizens." Furthermore, both derive from revolutions. The revolution of the 1600's produced the idea that scientific beliefs are universal "applicable everywhere." The American revolution also universalized a belief that human beings do indeed have rights, and we are striving to apply this principle everywhere.

MURDEROUS HISTORIANS

The Wench is Dead by Colin Dexter. Bantam: New York, 1991 (1989 hard bound). $4.50. Reviewed by Fred Schroeder.

We rarely review works of fiction in *Humanities Education*, and although we have published several articles on the uses of detective and courtroom fiction and film, this review of a popular mystery is unusual. It is one of Dexter's

1629

Inspector Morse mysteries, some of which have been dramatized recently on PBS, and like all Dexter's novels, it is a cracking good story filled with urbane literary, musical and linguistic allusions and puzzles. This puts it solidly into the tradition of playfulness which is an essential ingredient of the "classic English mystery," of the ilk of Dorothy Sayers, Agatha Christie, Gladys Mitchell, Edmund Crispin, Jonathan Gash and many others. *The Wench is Dead* also shares in the sombre psychological and sociological soul-searching that has made such authors as P. D. James and Ruth Rendell recognized as major novelists who use the conventions of murder, detection, pursuit and solution as a framework for the exploration of profound human concerns.

But *The Wench is Dead* also is part of a smaller subset of detective-mystery fiction, the mystery in a historic setting. The twelfth-century Brother Caedfel novels of Ellis Peters (there are seventeen at the moment) immediately come to mind, but Anne Perry's Victorian settings, Peter Lovesey's Sergeant Cribb mysteries, Leonard Tourney's Elizabethan husband-wife sleuths, and Lillian De la Torre's Dr. Sam Johnson, Detector are further examples. (For more recent history, there are Elliot Roosevelt's stories casting as detective, his mother, Eleanor Roosevelt.) Mysteries of this type are generally well-researched, accurate in most details, and at least food for discussion regarding the historical verity of characters. (There is a tendency to inject characteristics of feminism, political liberalism, rational skepticism, and I suspect, of literacy and cleanliness, that are more wishful hindsight than real historical psychology.)

The Wench is Dead is in a further subset, because it does not strive to recreate a historical period. Rather, it is a modern story about solving a historical crime. Inspector Morse is hospitalized for ulcers, and for light reading is given a tract by a local antiquarian recounting the rape and murder of a woman on the Coventry to Oxford canal in 1859. The retro-criminology from a hospital bed is a direct steal from Josephine Tey's *The Daughter of Time* (wherein Inspector Grant addresses a crime of Richard III). The value of this novel to humanities students is in the processes of historical research. It runs the gamut of written documentary evidence: court records, timetables, maps, letters, newspapers; but it also uses several kinds of artifactual evidence: articles of clothing, tombstones, household woodwork. In short, fictional as it is, and with all the serendipity that fiction allows, the novel is an excellent chronicle of the process of historical research from identifying a problem that seems worthy of investigation, through the sifting and weighing of evidence, to the ultimate answer, which is ultimate, but like all human affairs, not certain. Another literary value to this novel is the chapter epigraphs, which are singularly varied and apt.

1639

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity**, **humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)

CONTRIBUTOR INFORMATION

Contributors should consult the Editorial Policies sheet carefully. As will be seen, HE is wide-ranging, quite permissive and has no "party line" in respect to definitions of **humanities, interdisciplinary** and **education**, but the wide boundaries are nonetheless firm. Please do not submit articles over ten pages long unless you are planning to revise.

Wayne Narey

THE DISCURSIVE, SOLIPSISTIC APPROACH TO TEACHING

My final class evaluation as a Graduate Assistant took place in an Introduction to Literature course, where I taught the standard fare, which many of you will recognize as the one-semester class meant to acquaint students with the different genres of literature. Our department allowed us to choose whatever we wanted from drama, fiction, and poetry; thus it was possible to teach a play of Shakespeare's, followed by Hemingway's short stories, and then jump across the centuries in poetry. That particular semester, I taught Eugene O'Neill's *Desire Under the Elms* as the first dramatic work on the syllabus; by using this modern play I could explain the sub-genre of tragedy to my students, then turn to a discussion of classical tragedy as well—O'Neill's play emulates Euripidean drama.[1] For the final work in the class, I came back to O'Neill's *Long Day's Journey Into Night* in order to point out the differences in dramatic style, symbolism, and thematic structure between it and *Desire*. I liked the class and was pleased by the way I had organized it.

So it was that when a senior member of the English faculty observed my first class on *Long Day's Journey*, I was a bit cocky; I felt comfortable, as it were, about being watched. The class went well. I always spent the first session on a new work giving students the necessary background to understand material in a particular context, or providing familiar analogues from other generic types; if we "discussed," so be it—I never pressed them my first class. As it so happened, several students did ask questions during our brief 50 minute session, while I presented them with questions of my own. Everything seemed to click, and I was not a little relieved when student questions fell in with what I had prepared. Even after four years of teaching, evaluation days made me anxious, but on this occasion all went well in my estimation, it could not have been a better class.

To my surprise, when I met with my observer I got a "mixed evaluation"—much like getting a "C" grade—my first in nine semesters. My inadequacy: a failure to give students enough discussion time. The "Socratic method of teaching," I still remember being told, "has been proven to be the most reliable; the classroom must be a place of give and take." I wasn't sure who had proved this statement or how the test was conducted, but in my defense I pointed out the unSocratic problems I faced: it was a 50 minute class, a large one of 35, and at least 20 minutes had in fact been nothing *but* student discussion. However, I told her that whenever

I approach a new work I like to set up the material before we talk; otherwise students, when they speak at all, comment upon things they usually know nothing about, having no point of reference for discussion. As a result the same students, those who like to talk, dominate the class, usually asking what I'm about to give them, or leading us into areas not relevant to the material. And those who must be gently pushed into taking part become frustrated, trying to say what they think "I want," yet having no sense of direction or confidence in their observations.

These are typical problems in a one-semester course that attempts to give students an introduction to a core-curriculum discipline. I asked my evaluator some questions of my own. Wouldn't a little set-up information on American drama help to spur discussion? or to explain O'Neill's symbolism? or his concept of the family as a destructive entity? or perhaps to point out the autobiographical nature of *Long Day's Journey*? I asked too if she were talking to me about his play (not her area of specialization), wouldn't she like to hear about or be refreshed on a little background before making assessments or discussing the work? My evaluator listened politely and offered to type on her form exactly what I had said under "comments." However, I was quietly angry and foolishly said that the report could remain as written. I did what graduate students, but not assistant professors, are permitted to do: I sulked.

I didn't realize then how much the experience would help me: it made me rethink many of the things I had been taught about teaching in Graduate School. Now, several years later, I still look back on that evaluation, questioning her premise about the Socratic method more than ever—not that I don't believe in it; many times I have let my students talk about a new work before pulling in the reins and structuring their remarks in the light of what I want them to see.[2] But it isn't *always* the best method for teaching, and this past semester I tried an alternative.

I want to do two things in this essay: first, relate my teaching style (for that course), arguing why it can be effective; second, include a generous sampling of the class material, because the two cannot be separated—I chose the works because they would facilitate my intentions. I should mention too that I don't wish to argue pedagogy or to explain how we deal with the problems I asked my evaluator, but to present an alternative technique for classes where the material complements a discursive, solipsistic teaching style.

Of course my title for this essay, only marginally in jest, gives away the technique: I loaded up the class with more material than we could possibly discuss in three semesters, doing most of the talking myself. While I was organized, the material was purposely discursive so that we could not lump our generic eggs into one basket. Let me turn to the syllabus first and explain why it contained as many works as it did.

When taking classes for a Master's Degree in Liberal Studies, I had a course in Baroque literature—one of the best classes I've ever had—which combined some visual art with the poetry and drama listed in the course outline. In proposing a one-time Honors class for

Arkansas State, I wanted to emulate what had been for me an exciting, fascinating course. However, I expanded the genres according to my own preferences and changed the reading considerably, adding far more works. My course was listed as "An Age of Sensuality, Conflict, and Inquiry: The Baroque in Literature, Visual Art, and Music," a title only somewhat less robust than the amount of material promised. Included with the modes of artistic expression found in the title, we looked at the scientific, philosophic, and religious changes that took place from about 1530 to 1750.

I picked the Baroque—an amorphous, multicultural period that many scholars deny as a singular, definable historic era—because of the astonishing corpus of artistic expression and philosophic thought, undeniably the greatest outpouring of humanistic endeavors that history has ever known. Part of my thesis for the course was that at times of crisis the arts and sciences flourish: besides the religious, sociocultural conflicts between Catholicism and Protestantism, the era presents the confrontation of two variant worlds: a neoplatonic microcosm/macrocosm set against the Cartesian despoiling of fixed hierarchial orders. So I inundated my students with all the expressive forms caught up in those tensions: the poetry of Donne, Herbert, Vaughn, Milton, Teresa of Avila, and St. John of the Cross; the drama of Shakespeare (*Hamlet* and *Antony and Cleopatra*), Calderón (*Life is a Dream*), and Corneille (*Le Cid*); the visual art of Correggio, Caravaggio, Titian, El Greco, Murillo, Velázquez, La Tour, Rubens, Rembrandt; the sculptures of Bernini; the philosophic concepts of Descartes and Spinoza; the scientific advances of Copernicus, Kepler, Galileo, and Newton; the Thirty-Years War; the Counter-Reformation and Inquisition; the music of Locatelli, Vivaldi, and Bach; opera. We had no time to *discuss* anything. Pardon the '60s connotation, but we "experienced" the material. My primary intention was to entice my students, whether through the visual arts, philosophy, science, poetry, or history, into further inquiry of their own.

I began the semester by outlining the elements that many scholars attribute to Baroque painting, then asked that the students seek them out in other modes of literary, philosophic, or musical expression. Visual art came first because it presents a more defined means for illustration, that is, a painting has concrete form that can be projected on a screen and commented upon. We first looked at the movement and circularity in the art of Correggio, the theatricality, the interrupted, frozen moments of captured time, and the dramatic contrasts between light and shade. From Correggio we moved to other Italian artists who painted figures with garments blowing in the wind, soaring angels, boldly foreshortened cherubim, horizons that disappear into infinity, or, as in Baroque architecture, the deeply recessed perspectives that replace the direct, clear lines of Renaissance finite space, and the multiple, repeated Baroque linear patterns that suggest a soaring, boundless energy. I might add that in saying how the Baroque differed from the Renaissance (or Mannerism), I gave them information on other often-disputed historical periods as well.

From visual art we then turned to the poetry of Donne and the metaphysicals.

1637

That scholars cannot agree on the validity of such a term was in no way detrimental to my intentions, nor, I might add, did it slow me up: it merely confirmed what I *wasn't* going to do in the class—let the students stop and discuss the matter. I presented the arguments for and against the label "metaphysicals," suggested a few references, let them decide for themselves—whenever and if ever they wanted—whether there was clearly a literature that could be said to reside within that designation, and then went directly to the poetry.

We *read* Donne. I would call on a student after going over a few lines of the poem myself, and then sit back. This we did slowly, and I felt no hesitation at stopping the reader and asking that a line be reread, reread more slowly this time: savor the sound, the idea, the *feel*. Of course, there were questions as we went along, and I never discouraged them; but I regarded theirs as different from those in my other classes: our class sought their own reference points, wherever they wanted to fix them; I *wanted* them to anticipate what I would say; and how could anyone lead us astray? we were going *everywhere*. I simply did not encourage discussion for discussion sake. There was never that "proven Socratic method." I wanted my students to be awash in the magnitude of the creativity and philosophic inquiry of the era, to feel it through a generous, representative sampling of its people, and to find for themselves what interested them.

Thus, I did most of the talking; except for their reading aloud, classes consisted of my lectures, fitted into that old standard: 50 minutes, 3 times a week. My class was admittedly solipsistic. I should admit here that I worked as an actor for a number of years performing Shakespeare and Molière before returning to Graduate School. Performing has always been an enjoyable experience for me; teaching and the stage are remarkably similar. Yet I don't use the classroom as a sublimation for the theatre. While it takes skill to manipulate and organize discussion, we all know that it's an easier hour or two than continual lecture.[3] My point is, whatever talents we have *they* should be used in the classroom rather than molding our abilities to a "proven method" of teaching. Vladimir Nabokov said it far less prosaically in *Pale Fire*: commenting upon teaching Shakespeare, John Shade says, "dismiss ideas, and social background, and train the freshman to shiver, to get drunk on the poetry of *Hamlet* or *Lear*, to read with his spine and not with his skull." I did everything I could to reach their spines.

The opportunity for them to speak, aside from the questions that arose, came with their oral reports, of which there were two: the first individual, the second paired with another student. I asked that students give a ten minute report on a work not listed on the syllabus, but one germane to whatever I was currently teaching—a poem by Richard Crashaw, for example, when we were reading John of the Cross. The second report, fifteen minutes in length and later in the semester, was meant to present two comparable works in different disciplines: for instance, a Jacobean play by John Webster or Cyril Tourneur in relation to an anamorphosic painting.[4]

My payoff for the semester came with their papers, wherein I also encouraged comparisons, and which again dealt with material not on the syllabus. I was rewarded with interesting, imaginative efforts that drew upon a more complete understanding for a distinctive corpus of work, rather than the usual particularized areas of study. Again, I don't argue that this is preferable in every instance, merely that their papers demonstrated the wealth of inherent possibilities in a discursive, interdisciplinary romp across two centuries. Theirs were fun papers that reflected analytical, comparative thought and encouraged the same from the reader.

Of course there's a drawback to all this, and I wouldn't be honest were I to say that no problems arose. First and foremost was the amount of my preparation, one reason why many of our faculty at ASU don't submit Honors proposals. Such classes require lengthy research and go beyond one's specialization (the Honors seminars come from submitted proposals, the primary requirement being their interdisciplinary content). The possibilities for team teaching, however, can overcome this—I had a philosopher give a lecture on one occasion; so too, if one looks at the course preparation as a step toward personal research and publication it makes sense. Second, I had to contend with the "snowball effect" of presenting so much material in such a discursive manner. I rushed when it wasn't necessary and was often tempted to add ever *more* material. Organization and adequate preparation are a must: *Hamlet*, for instance, had but three days, and my inclination was to teach everything about the play rather than to concentrate on the baroque, metatheatricality of the Players' scenes.

The drawbacks were few, however; and, no, I won't teach all my classes like this one. But when the material warrants it, and you've got the energy—and desire—to reach spines as opposed to skulls, the discursive, solipsistic method has much to recommend it. The pageantry of the humanities has its own vagrant beauty that lends itself to a good romp every now and again, one in which you can indulge yourself while profitably sharing in the pleasures of artistic and philosophic achievements.

Notes

[1] See my "Eugene O'Neill's Attic Spirit: *Desire Under the Elms*," an essay arguing for O'Neill's attempt at true Attic drama, not inaccurately perceived—as he believed most Greek tragedy was—but as a rendering of malevolent chthonian deities and spiteful gods: *The Eugene O'Neill Review* (spring, 1991).

[2] A former professor whom I had the greatest respect for, the late Frank Brady, used to let everyone discuss material for most of our two-hour seminars. Magically, he would then spend the last fifteen minutes putting everything into context, gently correcting false assumptions or praising observations. I came to marvel at his talent for reorganizing discussion material into a cogent, informative brief "lecture" based on the assigned material in the light of our remarks. But that was Graduate School, and by that point most of us had some contextual understanding for our reading, even if the particular work was new to us.

[3] A colleague of mine, a full professor, was amused by my plans to do most of the talking in the class, commenting that I was obviously "a recent Ph.D."

[4] A trick of perspective that demands a viewer's active participation in deciphering a seemingly blurred image of or in a painting. The image is unrecognizable but comes into focus when the viewer enters into the "game" and looks at the image obliquely—much like a fun-house mirror. "The Ambassadors" by Hans Holbein (1553) is perhaps the most famous example; the blurred image at the bottom of the painting is that of a skull, a *memento mori* and pun for Holbein's signature ("hole bone"). See *Anamorphoses: Games of Perception and Illusion in Art*, New York: Henry N. Abrams, Inc., Publishers, 1976—a pamphlet-length guide to a touring exhibit of anamorphosic works in 1976.

Karl H. Kregor

MISHIMA'S "PATRIOTISM": SAVING THE ALIEN TEXT

In 1986, Yukio Mishima's short story "Patriotism" appeared to be an excellent candidate for a first-year student seminar whose theme was "Freedom and Responsibility." A faculty member urged its adoption to approximately 35 professors representing a dozen different disciplines from the humanities, sciences, and social sciences, who were considering texts for the seminar. "Patriotism" was described as an accessible tragic tale, likenable to Romeo and Juliet, told in a realistic style. In it, a young lieutenant commits ritual suicide as a consequence of a failed military coup begun by his friends who do not include him. Expecting to have to lead a unit to attack them, which he cannot do, he resolves to end his life. Before that act, he and his wife engage in tender intimacies and exquisite lovemaking. His wife witnesses his death and takes her life.

To a faculty sensitized to issues of cultural diversity, the tale seemed perfect because Mishima, though deeply affected by Western Romanticism and classical culture, retained deep respect for ancient Japanese cultural mores. We were encouraged not to have misgivings about using this Japanese text for the seminar because, to paraphrase the argument, "Its setting only appears to be alien to our students and ourselves, and its emotional core is one we all understand at some level of human commonality."

However, my colleague Scott Baird who is fluent in Japanese and works with native speakers to translate poetry, prose, and edit texts on intercultural issues, said (in his gracious way), that while the observations were understandable—and that Mishima's fascination with the west even *invites* those views—we might be off the mark. To a Japanese reader the lieutenant and his wife are naive, mis-educated, and their behavior is an embarrassment. On the basis of his brief but trusted remarks, the workshop faculty wondered if they could teach the story well, doubted the tale fit the seminar theme, felt too pressured by a deadline to explore the matter in depth, and, as a result—voted out the work.

Now begins a cautionary tale: After the workshop I was curious to understand Baird's position and, with his help, explored the problematic elements which could undermine an apparently accessible reading. I began reading Japanese medieval epics, particularly the "Heike," from the *Heike Monogatari*, a collection of epic military tales tied to major wars of 1180-1185, to establish a baseline of expected samurai values and cultural contexts. In the meantime, Baird reviewed the story's sociological details in order to determine how a

Japanese reader in 1961, reading a story set in 1936, would "read" the couple's behavior in light of class, status, and relations to ancient traditions. We agreed to work apart, reconvene, and compare notes.

I found many traits characterize the epic military officer and his world, three in particular which are relevant to "Patriotism"—1) displays of feudal loyalty ("an unworthy death is a lasting shame"); 2) erotic potential is sublimated into a kind of stoic arete; 3) demonstrated sensitivity to (and even talent in) music, art, and poetry. In virtually every instance, the lieutenant's character and narrative context either fails to reflect these traits or undercuts them.

First, regarding loyalty, we are told the lieutenant is "disturbed" and "indignant at the imminent prospect of Imperial troops attacking Imperial troops" (93). However, though he had known that his "closest colleagues had been with the mutineers from the beginning" (93), the lieutenant never stands for either side. The narrator tells us: "His farewell note consisted of one sentence: 'Long live the Imperial forces.'" But *which* set of Imperial forces? Nor does his first response to the news clarify where his loyalties lie: he returns home and locks the door to insure his privacy.

Second, regarding eroticism and sublimation, the lieutenant believes the "urges of the flesh and the sincerity of his patriotism" are two aspects of the same thing, or as somehow synthesized. But the epic warriors are never depicted in erotic or sexual contexts, much less do they speculate on such relationships, even though epic narratives place warriors in elegant homes, consoled by attentive women of their own class. Patriotic *duty* takes precedence over sexual desire, and not in western "dualistic" terms, but in terms of social and literary decorum.

Third, regarding sensitivity to art, Mishima's lieutenant has no "music" in him. Whereas the medieval warrior composes poetry, can play an instrument, responds to art with sensitivity, and moves in courtly circles where singular exquisite artifacts are part of the warriors' social setting, Mishima's lieutenant doesn't demonstrate any esthetic sensibilities beyond the esthetics of his impending suicide. While his home has some artifacts, they seem undistinguished and are associated with his wife: (ex. small china animals: a dog, a squirrel, a bear, and a fox).

Having found these differences between the corresponding planes of literary military heroes, I wondered if I had taken for granted other aspects of the couple's life and generated a list of questions to ask Baird. When he and I reconvened to compare notes, it turned out I was right to be suspicious! As we described to each other what we found or had questions about, we had those kinds of "aha!" experiences that make interdisciplinary work so exciting.

For example: When I described how the lieutenant has no music in him, and how his setting lacks fitting art, Baird pointed out that the setting's artifacts demonstrates the couple's middle-class status. A samurai demonstrating proper reserve would have a minimalist, severe setting, on the principle that one does not "advertise" experience nor do significant experiences need external confirmations. Other discordant details include a farewell letter the lieutenant's wife composed before their suicide. In it, she apologizes for her "unfilial conduct" in preceding her parents to the grave. But by not describing any provisions for her parents' old-age care, which a traditional wife would have made, she reveals to a Japanese audience an embarrassing failure to fulfill an expected responsibility. Moreover, the shameful failure has an even deeper, but implicit, embarrassment: her *parents* have apparently failed to train her well.

This couple is also a bit off the mark in other matters relating to marital "instruction." We are told the couple had not met until a few months before their marriage, and they took no honeymoon "on the grounds that these were times of national emergency." Also, on the first night they spent together, he "had bestowed upon her a soldierly lecture... that her husband's death might come at any moment [and] was she steadfast in her resolve to accept it?" (94-95). Her response is to put "the most prized of her new possessions, the dagger her mother had given her, . . . on the mat before her." For her, he had become "the sun about which her whole world revolved," who "Constantly admonished [her:] *never to think of the morrow* "(italics added) (95-97).

As his wife's teacher, the lieutenant had also taken to heart the Education Rescripts' injunction that "husband and wife should be harmonious." The lieutenant reads it as vigorous passion and raw sexual vitality, so much so that: "begrudging even the time it took to remove his mudsplashed uniform, the lieutenant had pushed his wife to the floor as soon as he had entered the house" (95), to which the wife gladly assents.

For a Japanese audience these passages on their marriage and his instruction have nuances which we can easily misread. First, honeymooning would not have been a traditional expectation in 1936, the time of the story, but evidence of growing western cultural inroads. So the lieutenant's choice not to honeymoon, on the grounds of "national emergency," is not a major sacrifice. Ironically, his choice overstates his importance in the rebel movement in which he never plays a part. Second, their hermetic relationship is pointedly asocial, and her 'satellite' role to her husband's 'sun' would be inappropriately subservient in the respected decorum of a samurai warrior's wife.

Third, their narcissistic, intense sexuality is also indecorous. The sensuous relationship is *not* that of a responsible couple, but that of secretive lovers. The passionate quality of their sex, despite their married state, signals the kind of self-absorption which threatens social coherence, not sustains it. Their sexuality so clouds the lieutenant's thinking, in fact, that we are told he sees the "urges of the flesh and the sincerity of his patriotism" as two aspects of the same thing—when, traditionally, they are never to be equated. Finally, the lieutenant's instruction to his wife: "*never to think of the morrow*" is most significant. As Baird remarked: "It is simply not Japanese."

I thought I had saved one trustworthy east-west corollate when I told Baird that at least the lieutenant's ceremonial

1643

disembowelment becomes him, it has a "touch of class." But no. Another misread on my part. First, it's too private. There ought to be some witness from among his military peers, friend or enemy. *Seppuku* takes on substantive meaning only if it is in some way public. Second, to do it properly, the knife (or sword tip) is inserted in the lower left portion of the abdomen, pulled across to the right, then turned at the ribs' edge, drawn up across the chest (still in the flesh), then into the heart. The lieutenant never turns the corner. To a Japanese *seppuku* afficiando, the lieutenant's final self-fashioning gesture leaves behind a mess, not an honorable memory.

Even if we think such socio-cultural misreadings are intellectually correctable by the kind of work Baird and I did, there are still emotional and connotative matters in "Patriotism" which resist *empathic* understanding. For example: even if I can internalize being a military officer, I cannot begin to internalize a loyalty shaped in the cultural context of Emperor worship, nor how such conditioning shapes one's psychological processes, especially denial. And about his marriage. I *can* imagine myself at 31, having a bride 8 years my junior, and I *can* understand how their honeymoon might be postponed, how their household is middle-class, and I can even understand their mutual esteem and exquisite lovemaking. But—that my bride would be "earth to my sun," hang upon my every word, that she would be a true *tabula rasa* for my complete instruction, well, these demands require faith in science fiction and fantasy, not reason.

And how can we "save" ceremonial disembowelment? Here, suicide is private, hidden in accidents, and motivated by despairs unique to each actor. There, in Japan, *seppuku* is a specific kind of suicide, a subset within a cultural genre, for which we certainly have no corresponding model. Most importantly, to appreciate it requires an exquisite appreciation of shame. *Seppuku* is an ethical gesture, demonstrating a warrior's integrity and courage, a response to a public perception that behavior had been shameful. Mishima once explained *seppuku* to an interested Englishman:

> I cannot believe in *Western* sincerity because it is invisible, but in feudal times we believed that sincerity resided in our entrails, and if we needed to show our sincerity, we had to cut our bellies and take out our *visible* sincerity. And it was also the symbol of the will of the soldier, the samurai [and] proved the courage of the samurai. This method of suicide was a *Japanese* invention and foreigners could not copy it. (Scott-Stokes, 5)

Shame, for the Japanese, is a pervasive cultural force beyond our comprehension. Can we, in many ways a shame*less* culture, internalize and convey to students how shame, sincerity, courage and ritual suicide work in the heart of a 31 year old Lieutenant in the Japanese Imperial Army and his 23 year old bride in 1935?

This brief description of what I would now call "mis-cued empathic responses" and unfathomable demands are only two dimensions in which misreadings can occur. If we think it's easier to save "Patriotism" at the levels of biography and genre, we'll discover that even these more disinterested strategies can be problematical.

For example, regarding Mishima's life and its relation to "Patriotism": By age 45, Yukio Mishima was an incredibly successful and prolific author, with a world wide, jet-set reputation, powerfully attracted to western romanticism and to classical models of physical beauty—prompting him to compulsive body shaping and the pursuit of excellence in all the Japanese martial arts. Politically, he held some vision of the medieval samurai way as a patriotic model for modern Japan to internalize and, in the process, rid itself of the sins of material prosperity, rebuild its armaments, and end the *unauthentic* sovereignty forced upon them by America after WWII.

On November 25, 1970, he led a group of followers to a defense base. To the puzzled surprise of the base commanders—who thought he was coming for tea—he held the commanders hostage. As Stephen Chan put it: "His attempt at a coup was certainly symbolic," because after an "impassioned and, often, inaudible harangue of the assembled soldiers. . . without offering a programme for an uprising, he retired to the commander's office and in front of the bound commander, committed *seppuku*" (134). Japan's response to the news was one of puzzled surprise compounded by awkward embarrassment. How could Mishima believe neo-samurai values had a place, much less supplant, a new constitutional order whose benefits were obvious to all who participated?

Since the benefits of the new order were as obvious back in 1961 as they were in 1970, perhaps we can save "Patriotism" by reading it as an ideological parable, a call to the Japanese public, with the lieutenant's *seppuku* foreshadowing—even prophesizing—Mishima's, and both acts of *seppuku* symbols of what Japan has been doing to itself since its opening by the west. Set in 1935, the tale might be said to epitomize the values which the future (1961), should be reminded to cultivate. However, the narrator tells us that those who saw the characters' wedding portrait "wonder" at their "bearing," and consider their suicides "tragedy." Apparently, the narrative shows us a Japanese public in 1935 who can no more understand the couple's suicide motives than the Japanese public in 1970 could understand Mishima's. One might conclude that the tale's link to Mishima's life demonstrates a common sense of tragic irony, especially through the word "tragedy."

But if one seeks to spin out the biographical thread in relation to tragedy, we find the expected generic traits have been undercut by the narrator. For example: while the observers in the story consider the couple "tragic," Mishima has given us enough detail about their lives—and in a cool dispassionate style—to suggest the couple was actually naive. As we have seen, the lieutenant and his wife seem mis-educated, and unable to understand the values *seppuku* truly embodied. If this is the case, then the story sags as tragedy and can be read as a tragic-comedy, replete with wry ironies.

This is how I read the tale as a consequence of my critical training, and I'm not alone. Hisaaki Yamanouchi, taking the broad view of Mishima's career, says his life "was one of paradox" (152); and Dick Wagenaar and Yoshio Iwamoto conclude: "As paradoxical as it may sound, it may be said that he redeemed his life by suicide and his art by installing within it its own negation" (60). Edward Seidensticker also charts a changing curve of attitudes in Mishima's work and finally says: "So it may be that even the writings of Mishima's last decade [including "Patriotism"], which seem so honest in their espousal of tradition and nationalism, take on a cynical cast. . . . Now, perhaps, they may be seen as exquisitely planned and elegantly executed nose-thumbings. . ." (282).

But here is what Mishima himself said of "Patriotism":

> This is neither a comedy nor a tragedy but simply a story of happiness. . . . To choose the place where one dies is also the greatest joy in life, and such a night as the couple had was their happiest. . . Somewhere I obtained the conviction that if one misses one's night one will never have another opportunity to achieve a peak of happiness in life (Scott-Stokes, 234-35).

Happiness! In addition to "mis-cued empathic responses" and unfathomable demands, we can now add "idiosyncratic genre." If the tale is *not* cynical, paradoxical, ironical, comic or tragic then we will have to rewind our reading and replay this couple's sentiments and actions from a new perspective. That is, the narrative presents a state-of-mind, mutually harmonious "happiness," and is not to be seen as demonstrating or reiterating familiar literary types. Mishima's comments force us to conclude that discernible categories matter less than that the narrative form express an empathic experience for us to enter.

I said at the outset of this cautionary tale that the seminar faculty was encouraged not to have misgivings about this tale because any apparently alienating matters were less important than its emotional core which we can all understand at some level of human commonality. But I think this "Transcendent Appeal," so well articulated by diversity advocates such as Diane Ravitch, begs the question of apparently accessible material which we misconceive, or intractable material which we must respect. That is, we can too easily begin with esthetic and emotive effects and, to account for them, mistakenly assume they have their source in common cultural values.

Ironically, the cautions we must take to wisely teach another culture's art are cautions which will promote the very act of teaching. From my experience with "Patriotism" I've restructured my research/teaching patterns. First, I begin now by tapping *people* who are themselves from the culture in question or who are demonstrably knowledgeable—colleagues, students, campus and civic groups, etc. Second, I look for supporting scholarship whose primary bent is cultural/anthropological/sociological/or biographical. Only thirdly will I look for interpretive criticism, and then preferring authors who are from the culture in question before others.

When I study works, I now look at minor gestures, details or remarks, subsidiary action, etc. with a heightened suspicion that they are meaningful in ways I do not see. Even if subsequent research suggests there is *nothing* more than met my eye, the artifact in question is more detailed and fixed in my mind than could ever be when I assumed an easy accessibility. Of course, none of these strategies guarantees wisdom. Invariably, tapping the points of view of many people reveals discrepant responses, and there is greater sophistication about classical Athens among German scholars than contemporary Athenians.

But the process has invigorated my teaching by rethinking the notions of authority, respecting an unsophisticated audience's response to art's impact, and reordering search priorities. It has also allowed me to re-see texts and ask students new questions (with nothing up my sleeve) to promote self-awareness and experience a sense of otherness: "What, honestly, is strange in this work?" "What values or beliefs would a person have to hold for this material *not* to be strange?" "Imagine yourself such a person. What kinds of conflicts might you have with your first self?"

If we ruthlessly press those questions, perhaps we can connect their intent to the Conference theme: The Global Humanities: Unity in Diversity. I have come to understand the phrase "Unity in Diversity" as one in which the term Unity is driven by this notion of experienced empathic Imagination. That is, through Imagination, we permit ourselves to "let go" assumed givens, and in the alien artifact experience some potential "other" that we are not. Through the imaginative act of becoming that other, then that awakened sensibility defines "unity in diversity." Unity is not a *thing* to be claimed exists among artifacts but rather a dynamic experiential process with varied intensities. Unity is our latent integrity to *be* many others. However, that kind of awakened sensibility is not quantifiable or permanent. In time, the empathic experience fades as we re-engage our usual operative strategies. But consistent imaginative experiences with diverse works will leave traces. To the extent we can have our students increase their stores of residual "otherness," then Diversity stands defined as the *means* by which Unity contributes toward the ethical ends—empathy and respect.

Unity in Diversity, understood as experiencing the other in the self, is the perfect complement to the notion of global humanities. By changing the focus of our questions from artifacts to ourselves-in-relation to artifacts, we enact the kinds of cultural behaviors which define a global humanities. The givens in this evolving culture are we *value* the world's diversity and seek to sustain them, and know them, in order to know ourselves. In short, interdisciplinary work in the humanities is driven, at heart, by an ethical imperative, redefining the Humanities as "humanitarianism," and challenging the conventional ends of art, expression, research, and instruction.

LONDON AS LABORATORY: A WRITING CLASS ABROAD

One of the most frustrating things about working with freshman writers is that they have travelled little, read little, and expanded beyond teenage mass culture even less. When we meet them in the classroom, we often assign "personal" essays that are doomed to be either shallow anecdotes about events from their high school years just recently past or predictable and cliché-ridden opinion papers that take one side or another of a current debate. It is just as difficult to interest a typical beginning student in fiction or history; sadly, their imaginations are so underdeveloped from exposure to so few stimuli that they experience resentment and boredom at the prospect of reading something that will take hours more than the same "material" could have been presented in a movie or that may demand their own analysis of facts, alternate conclusions, or the motivations of various personalities, real or fictional.

An ideal solution is an exciting change of locale, a challenge to cultural assumptions and habits, a dramatic confrontation with a different way of life. At Michigan State University, several members of the Department of American Thought and Language have conducted for the past three summers a writing program for freshmen in London that fulfills all of these dream criteria within an English-speaking, physically safe environment that offers enough cultural overlap (pizza, rock and roll music, video games) to produce a certain level of familiarity while placing students in a large and exciting city that will impress them simultaneously with its contemporary vibrancy and a sense of the past. Dorm space and classrooms were rented from the University of London. Faculty are familiar with the city and able to help students plan routes and make choices; further, assignments are designed to force the students to assess what they are learning through writing about their experiences in a variety of ways.

We used our own packet anthology from a local print shop; it contained excerpts about travel writing and about London in particular that were culled from the work of about twenty-five famous Americans, whether professional authors or not, who had visited or lived in London in the past. These essays and chapters of books, all in the public domain, included Jack London, Booker T. Washington, Mark Twain, and Henry James. Each student was required to read a number of these for class discussion according to the topic of the week (Washington Irving and Mark Twain on Westminster Abbey when the class visited the Abbey for a group tour, for example) and to write two-page personal "reactions" to six separate readings selected from among those assigned or from the remainder in the anthology. We also have used a book now sadly out of print: *Americans in London* by Brian N. Morton, an intriguing book from William Morrow that describes and maps the favorite locales or living quarters of a number of American celebrities, including not only writers but figures such as John Adams, Fred Astaire, Wallis Simpson and General George Patton. Each person is discussed briefly within the context of a certain London neighborhood; maps of those neighborhoods are numbered to show the exact location of the hotels or apartment houses associated with the celebrities. An assignment derived from this text was "tracking" a certain famous person to the actual place where he or she lived, trying to imagine what it was like for that person to be there, and describing what the locale is like today. The only limitation on this assignment, sadly but predictably, was the ignorance of the students about the identity of many of the figures, who were usually pre-sixties personalities, not contemporary entertainers or politicians. Perhaps a revised edition is in order!

The five-week class met four times a week, Monday through Thursday, from 9 a.m. to noon; the long weekend was deliberately created in order to allow students and faculty time to travel around the British Isles, to Ireland or the continent. The discovery by students that they were only one hour by plane from Dublin, Paris, or Amsterdam was a geography lesson in itself. For several who had never been far from home, it was reassuring to find that they could in fact organize a group trip to Wales among themselves and come back alive and unharmed even after missing their train and arriving at their destination without reservations. In dealing with the inevitable problems of travel, they gained confidence in their coping abilities and an experiential awareness that things eventually will work out, even with delays, cancellations and missed connections. Many took day trips to Oxford, Greenwich, Kew Gardens, Leeds Castle, or Hampton Court. Weekend trips within the British Isles included Dover, Cornwall, York, Stonehenge and Stratford-upon-Avon.

Everything the students did or saw was recorded in a journal along with their reactions. This personal writing provided the raw material for all their other written work; along with that, Monday morning saw the first hour devoted to a "de-briefing" of each student on his or her weekend activity. In this way, everyone knew what had or had not been worth attending among local shows and museums (the experienced faculty were of value here as well), and the less imaginative had the more reflective students as models for the sorts of responses that one could have to new and diverse places and experiences. One of the persistent themes was their perpetual exhaustion. Did they walk a great deal more than at the large Michigan State campus, they were asked? No, but at Michigan State everyone naps during the afternoon to make up for the fact that the dorms are too noisy to let one get enough sleep at night; the University of London dorms are just as noisy, but no one wants to nap because they're afraid they'll miss something!

On the first day of class, when the students were suffering from jet lag and nodding off in their chairs (the faculty had arrived several days earlier), they were assigned an in-class essay for no credit; the topic was "What I Expect to Learn This Summer." Students were instructed to file and forget these essays until the last week of class, when they would write an essay for credit on whether and how well they had realized or exceeded their expectations. This assignment was an excellent way to encourage them to summarize the total experience at the end and to be consciously aware of how they had changed and learned. Most, as might be expected, came away with much more than they had ever anticipated.

On the second day of class, everyone met at the Trocadero in Piccadilly Circus and took a double decker bus tour of London. The trip, which filled one and one half hours, helped orient the students and re-acquaint the faculty with the city geography. In future class discussions and de-briefing sessions, the initial tour provided a common experience which allowed the various speakers to remind others of the location of spots like Tower Bridge, the London Dungeon, Green Park or Big Ben and to use them as direction-finders.

Aside from the summary essay during the final week, students wrote six other full-length papers, three short, generally due on Wednesdays, and three long, due on Thursdays. Since all papers were hand-written, no word processors being available overseas, class time was set aside not only for peer editing, but also for revision. First drafts and journals were written out of class, as was a group project, "A Student Guide to London," also due the final week, but the rest of the work was done in class in order to allow students as much free time as possible to explore the city and its attractions (including pub life) or attend plays.

The three shorter papers, which were two to four handwritten pages, were of three types and could be written in any order the writer wished. One paper had to be descriptive; while most wrote about a park or building they admired, one woman elaborated upon her reaction to the painting "The Execution of Lady Jane Grey" in the National Gallery. When she later visited the Tower of London and saw where Jane Grey had been imprisoned and executed, she experienced history as "real" for the first time in her life. Another short paper had to be a narrative of something the writer had done; nearly everyone recounted a day trip taken with one or two others, a few the experience of waiting in line for "return," or unsold, tickets for major shows like *Miss Saigon* or *Les Miz*. The third paper was to be creative; sketches and poems were typical, many concerning the beggars and buskers that were abundant in the streets and subways.

The topics for the three longer papers, which all had to be done in the specific order they were assigned, varied with the instructor. In one case, the first paper (for the second week of class) was called "First Impressions." A rather obvious choice, the paper allowed students to verbalize their sense of excitement, bewilderment and even fear at the prospect of having to function in such a huge and complex city. They were given inspiration by their reading in an 1888 essay of the "horror" of Henry James upon having to leave his hotel and enter "the uproar of Piccadilly" in order to get a meal for himself. Briefly, he said, he was so filled with fear of the "infernal town" that he would rather have starved. When they saw how many entries there were for James in the *Americans in London* text, and later when they saw his plaque in Westminster Abbey, they realized not only that even the great and famous can be insecure, but that it is really possible for love to cast out fear.

The second longer paper was the "Tracking" paper. Some students found the hotel in which Henry James had first stayed in London, and added to that at least one other locale with which James was familiar. One woman tracked Wallis Simpson to the two houses mentioned in the book, one that she had occupied at the time she met the future Edward VIII and one to which he apparently moved her, a more elegant home that bordered (and still does) Regents Park. Others tracked various people they had heard of, but the value of the text and maps was diminished by the ignorance of the freshmen about the identity of many of the personalities.

The third long assignment in one class was on the lessons of history, one might say. A proposed title and source of inspiration was a quote from one of the travel essays in the anthology, "Travel... is a means of visiting other centuries." The theme was the way in which exposure to other places, and especially to their antiquities, makes a modern student-traveler aware of the past. Most, coming from the midwest, had never even seen a building as old as those on the east coast dating from the colonial period. Indeed, Michigan celebrated its 150th birthday in 1987! When those who have such a shallow conception of "the past" realize that there has been something on the site of Westminster Abbey since the seventh century, and they see the grave stone of Sebert, the first ruler to have built there, in addition to many royal tombs, including those of sisters Queen Elizabeth and Mary Queen of Scots, or when they see the Coronation Chair with the Stone of Scone, or Stone of Destiny, captured in 1296, encased within as a symbol of English dominance over the conquered Scots, they are appropriately awed. They are also amused to hear that Scottish nationalist students managed to "liberate" the stone briefly in 1951, only to return it later.

Of course, London is also contemporary theater, cutting-edge rock and roll, punks and dance clubs. Students were encouraged to go to matinees or museums in the afternoon and to go out somewhere every evening. Since the major museums are free, they were told to attend several times and to take places like the British Museum in small easily digestible doses, not to "do" it or the National Gallery or the National Portrait Gallery or even (free on Thursdays) the Imperial War Museum all in one massive dose. It was pointed out that relaxation time in a beautiful royal park was free, good for the soul and also terribly British. As the month wore on, free attractions became more and more important. While nearly every student had a credit card, cash in hand was always vitally needed; prices in London are rather inflated even within the English economy, but when the exchange rate does not favor the dollar the cost of an afternoon or evening on the town can be terrifying.

When, during the final week of classes, students formed groups of three and four to produce their guide book for future students in London, they never failed to point out the free or economical alternatives, including the half-price ticket booth for same-day theater tickets in Leicester Square, student discounts on various admissions (a special summer ID card helped ease the way in these situations), discount Underground passes, and the joy of walking. Another popular theme was the low cost food they'd discovered in sandwich shops and supermarkets; this was vital information because the dorm did not offer lunches. Throughout, they spoke with confidence and an authority rarely seen in freshman essays in East Lansing.

The value of this experience went beyond the insights and experiences mentioned above. More important, students who had never been much of anywhere and had never had much to say now wrote every day and were never at a loss for words. They produced personal, poetic, narrative, descriptive and expository writing in a variety of lengths and forms in addition to their short "reactions" to the assigned travel writing. Altogether, there were fourteen grades per student at the end of five weeks, not counting the personal journal; with a student-teacher ratio of twelve to one, that amount of grading was not an unconscionable burden for the instructor. Beginning writers must write; those who had had trouble in the past (several had been in remedial or "developmental" classes the previous fall) wrote at least as well as anyone else, and sometimes better. Not only were they thrilled at their progress, and at their learning how important involvement in one's material is for good writing, but they knew their parents would be full of joy and praise. What more can one class do?

The National Association for Humanities Education

announces

CALL FOR PAPERS

FOR A SPECIAL ISSUE OF ITS QUARTERLY JOURNAL INTERDISCIPLINARY HUMANITIES ON MUSIC: THE LOST DIMENSION IN THE HUMANITIES?

Papers are sought on the theory and practice of music within the interdisciplinary Humanities context. Many different approaches are welcome and our readers are interested in all levels of humanities learning: university, adults out of school, secondary, etc.

How do you integrate music into various Humanities contexts (historical, thematic, comparative arts)? What are the workable links between music and other materials?

What to do about the "great works"? How do you create useful resolutions to the abyss between art music and commercial popular genres?

In a Humanities context, how much of the technical features of music is too much? What is essential and helpful?

What should be the outcomes of music study within a Humanities course? How does one assess these outcomes?

Within the Middle School and High School curriculum what should the aims of music be in a Humanities course? What experiences have teachers had in integrating music into a team approach in Middle School?

How can the live program be used as a learning experience rather than just as entertainment?

Articles should be 10-15 pages, double-spaced. Instead of footnotes, provide a list of sources or a bibliographic essay.

Also WANTED: "Great handouts"

Do you have useful analysis guides? Listening charts? Music and History outlines? Musical definitions?

To subscribe to Interdisciplinary Humanities, make out a check for $20 to N.A.H.E. and send to J. Stanaway, Subscription Manager, 365 ABAH, University of Minnesota Duluth, Duluth, MN 55812.

SEND YOUR PAPERS, HANDOUTS, ILLUSTRATIONS, ANALYSIS GUIDES, ETC. TO THE GUEST EDITOR FOR OUR SPECIAL EDITION BY JANUARY 1, 1992:

Swearing: A Social History of Foul Language, Oaths and Profanity in English by Geoffrey Hughes, Basil Blackwell Ltd: Oxford, 1991. Reviewed by Fred Schroeder.

This historic study of foul language appears at a time when anyone in America is aware that there seem few if any refuges from such language. Movies, stand-up comedians of both genders, comic books, popular songs, fiction in nearly all genres, committee meetings and casual conversations overheard in school hallways are peppered with words that were *verboten* or *sub rosa* as little as two decades ago. This change is true throughout the English-speaking world, although the specifics differ from nation to nation. Geoffrey Hughes' book is partly motivated by questions that arise from the far-reaching permissiveness, and we might say his book also profits from it. Hughes draws heavily upon earlier studies, for example by H. L. Mencken, Ashley Montagu, and of course the Oxford English Dictionary, but there is no self-censorship, for he "calls a spade a spade," with no dashes, dots or bleeps. But the proverbial phrase I've just used illustrates another of Hughes' points: there *are* limitations and restrictions, for while religious profanities and even genital and excretory words are employed almost indiscriminately, racist foul language has become intolerable in many settings. In South Africa "kaffir" is tabu, in Australia "abo" is, although Australian speech continues to be one of the most oath-prone English dialects. The phrase I used, it should be said, refers only to a spade as a blunt instrument, but it is questionable now through guilt by association.

Another phenomenon of the license to use any words and phrases is "loss of intensity" or "verbicide" of swear-words. The more one uses and hears the words, the less potent they become for what they were intended. In *The Virginian*, the line "When you say that, smile," refers to the standard in the wild west that permitted the friendly use of a then unspeakable epithet, though one that retained its insulting potency in the wrong social exchange. That potency has eroded further, and many, many "unspeakables" have joined it. Related to the loss of potency is the total loss of grammatical or lexical function—some words can be inserted anywhere, occasionally with a hint of poetry as in the Aussie's "kangabloodyroo."

Swearing is a serious social history of one aspect of English and its historical antecedents, Anglo-Saxon and Middle English. To understand some of the earlier forms and their place in society, a modicum of language history is helpful, but also the three functions of swear-words: to swear *by*, swear *to*, and swear *at*, e.g. "I swear *by* my father's grave to avenge his death," "I swear *to* uphold the code of our clan," and "I curse your immortal soul to eternal damnation!" All three were solemn, binding and even magical in early English societies; all three have diminished to the degree that the last vestige of *by* and *to* is fossilized in the legal process, and *at* has succumbed to the child logic of "sticks and stones will break my bones but names will never hurt me." Historically there has always been a process of losses in intensity, and there has always been some kind of censorship (racist swearing is an actionable offense in several countries today, as is religious profanity). As to the first process an early example is the reduction of the profane oath "by God's wounds" to the "minced" form "'swounds" to the meaningless (and mispronounced) "zounds" and "zauns." As to censorship, in the seventh-century, the laws of the kings of Kent provided for fines for insulting words uttered in another man's house of a shilling to the house-owner, six to the insulted party and twelve to the king. Puritan England was even severer: Cromwell's troops were subject to physical punishments. Before his time the Master of Revels censor forced Shakespeare's characters to use oaths by pagan gods, minced forms, euphemisms and cunning codes.

Geoffrey Chaucer comes off as virtually the first and last author to have a free hand in foul and profane language, and to use it brilliantly to delineate character. Hughes' analyses of the *Canterbury Tales* are perceptive and lively. This chapter can be read by itself, but other readers may prefer to start with "Sexuality in Swearing," "Schismatic Vituperation: The Reformation" or "The Age of Decorum: Augustan and Victorian Attitudes," or just browsing the many charts and graphs. Teachers of linguistics, communication and literature may find specific value in this book, but for general humanities, it can provide worthwhile historical perspectives on ethical, aesthetic and legal issues of today.

BILL'S BIG BUCKS

"Art Imitates Business; Profit and Business Practices in the Elizabethan Theater" by James H. Forse in *Journal of Popular Culture* 24:2 (Fall 1990). Bowling Green State University, Bowling Green OH 43403. $25/yr.

Ben Jonson may have said that Shakespeare wrote for all the ages, but Forse makes a strong case for Shakespeare's writing for money. First, though, we should understand how much money we're talking about because Shakespeare's cash legacy in his will of £ 387 doesn't sound like much, and the per play fee for a playwright of £ 6 sounds downright shameful. As we all know, conversion of historic monies into contemporary equivalencies is rife with problems, but Forse (who teaches history at Bowling Green University) has two fair parameters. One: the penny admission for groundlings is estimated to be about equivalent to the price of a movie ticket (*not* a theater ticket!). Two: we have average figures for annual incomes in Elizabethan England. An artisan averaged £ 15, the 58 titled peers of the realm each averaged a gross income of £ 3360. Thus the average annual wage of the artisan who plunked down his penny to see *Hamlet* at the Globe was equivalent to $19,800—almost identical to the average American wage in 1988.

The commercial theaters accommodated 2000-3000 auditors, averaging 15,000 paid admissions each week. At the lowest rate of the penny admission for groundlings (there were also 2d. and 3d. admissions) the weekly gross was at least $82,000 for The Globe and Blackfriar's theaters. Shakespeare was an actor-partner as well as a playwright, so he shared in house-receipts as well as collecting playwright's fees. He also got his cut of concessions. In addition, his lands at Stratford were valued at £ 300 in annual income, "a figure which by itself ranks him equal to many of the lower gentry," but Forse estimates Shakespeare's theater income at almost twice that amount.

Shakespeare, by the year of his retirement, was a millionaire in cash income, and he was not the most wealthy of the actors. Therefore, there was high motivation to enter the acting trade. Forse finds that almost every actor or manager for whom biographical information is available had left some trade outside London to come into theaters. Not vagabonds, not jugglers, not gentry, not artists, but men with jobs averaging ten pennies a day (often limited by laws generated by the great guilds, as well as limited by village demography). So much for the personal profit motive; how did business affect Shakespeare's art?

For one thing, Bill, like all the other theater people, pulled his own plays out of production if they weren't bringing in crowds. He also re-used sure-fire crowd-pleasers—feigned madness, stranglings, eye-gouging, sword-play. It is significant that one of Shakespeare's lowest-rated plays, *Titus*

Andronicus—filled with murder, mutilation and rape—was, like *Hamlet*, revived again and again. Since The Globe was a partnership of actors, he designed characters not solely for art's sake, but for the actors, and saved money by having the actors play double and triple roles. Moreover, "Shakespeare operated on the principle, 'You've read the book; now see the play'." Forse demonstrates that Londoners were much more literate than most people think, and that the annual output of London's publishers of as much as a quarter-million copies indicates that sales and readers extended well beyond peers, gentry, clergy and libraries. He thereupon charts Shakespeare's shift from history plays to classical subjects in comparison to the appearance of popular translated books. The English didn't cease to be patriotic after *Henry V*, but pop reading had shifted to new translations of Plutarch, Pliny and Suetonius. Certainly the most compelling example of Shakespeare's best-seller exploitation is *The Tempest*, based on an exciting current event, and a virtually plagiarized passage from recently translated Montaigne's *Essays*.

This article is recommended not only for the cross-disciplinary perspectives that it gives to Elizabethan theater, but as an example of recent trends in historical writing, "demystifying" revered heroes of the humanities by means of the New Social History's employment of demographic and economic statistics. (F.S.)

DO NOT REMOVE THIS TAG!

"Take a Long Look" by Nancy Tieken in *Museum News* May/June 1991. AAM, 1225 Eye Street NW, Washington D.C. 20005. $6/issue, $34/year.

Some people in museums would like the objects to speak for themselves. Others want guided audio-visual tours without anything to read. Most want labels to be short and factual; almost everyone skims or ignores long labels, but every museum-goer has been frustrated by looking for information when an object or picture piques his or her curiosity. Clearly, you can't satisfy everyone. This short article describes an NEH-funded project in label-writing that Tieken worked on while she was director of education at the Currier Gallery of Art in Manchester, New Hampshire. The purpose, ultimately, was to use labels as a medium for helping visitors to spend more time looking at the artworks themselves.

Tieken began by finding out what people wanted to know. There were some surprises, such as people wanting to know what the accession numbers meant, whether the frame was original, how long it took to make a tapestry. Others seem obvious, yet too rarely appear on labels, such as what is the "story line" in a narrative painting. An assistant assembled files of information about each artwork and wrote a rough draft which Tieken condensed into what she thought would be engaging and informative. This text went to other staff members for comments, and then Tieken rewrote and formatted on a PC and laser-printed the labels. Several examples are provided, including one for a color illustration of a 17th century Dutch landscape which is included with the article. The key element in the labels is to refer to things in the picture, so that the reader is obliged to look at the picture—something that doesn't happen in the ordinary art museum, where labels have lives of their own. (F.S.)

BLEAK (SCHOOL) HOUSE

"The Ho Hum Revolution" by Chester E. Finn, Sr. in *Wilson Quarterly* XV:3 (Summer 1991). P.O. Box 52211, Boulder CO 80321-2211. $24/year.

Professor Finn is a good person to "keynote" this section of *The Wilson Quarterly* on "Why the Schools Still Don't Work." As an assistant secretary of education under William Bennett, Finn was among the leaders in the "excellence movement," and he continues as director of a privately funded excellence network. Although the entire article is well worth reading, this abstract only summarizes the "10 classic types of school reform" produced by this movement, all of which have been tried somewhere, with some success, but with only spotty replication in other systems. The first two reforms use standardized testing, for students (including raised graduation requirements), and for teachers. The third type of reforms include changes in teacher recruitment and licensure. Some changes have been programs to attract able people by way of special scholarships, etc., boosting the liberal arts "content" for teacher education majors, and, in 48 states, opening alternatives to university professional education degrees as a requirement for licensure. The fourth kind of reform is improved curricula—beefing up cultural literacy, geographic knowledge, mathematics skills, and so on. Fifth are improved testing and assessment programs, but with Finn's citing a 1987 study that showed that the "six commercially prepared tests widely used in the nation's elementary schools" are structured so that "no state's scores appeared to be below average!" There's a long way to go before testing is likely to produce excellence. Sixth are programs of incentive and awards, but America's teachers and schools are not very friendly toward singled-out stars, unless they happen to have been singled out themselves. Seventy are business and university partnerships—there are reportedly 140,000 such arrangements, but Finn sees signs of a backlash: educators will take money, but not "interference." Eighth is a currently dominant catchword, "school restructuring." Ninth is a bit vague, "making more schools 'effective'." Unfortunately, schools that year after year prove to be "effective" by way of high college entrance scores, etc., "tend to be home-grown, idiosyncratic, defiant of that classical

1659

bureaucracy"—magical blends of community support, parental commitment, highly motivated teachers and charismatic administrators. The last kind of reform is empowering parents to select their child's school.

So we can say that there is no shortage of ideas. But there are also powerful forces that may frustrate any widespread improvement. In a companion article, high school teacher Patrick Welsh provides a bleak picture of the American high school subculture, and says the only real common denominator in student excellence is an excellent home. An inserted passage from Jacques Barzun's recent *Begin Here: The Forgotten Condition of Teaching and Learning* expands the view to American society *in toto*. We don't really *want* excellence, except in sports. (F.S.)

ERODING CLASSICS

"Cicero and American Education" by Michael Mooney in *Italian Journal* V:2. 278 Clinton Avenue, Dobbs Ferry N.Y. 10522. $36/year.

That classical studies were once the center of education in America we all know, but when and how did it begin to disintegrate? Mooney, who is president of Lewis and Clark College answered this question at the close of a conference devoted to the great Roman Cicero. Actually, he is not dealing with Cicero as a person so much as "Cicero" as a "pedagogical program, based in oratory, built on the linkage of thought and expression, and directed to the formation of good and effective citizens." From early in the nation's history, though, American educators encountered both a practical, professional bent to teaching classics as tools for lawyers and clergy, and lively competition with business and technical studies for student's interest. With the 1862 Morrill Act, establishing land-grant colleges for agricultural study, classics began more and more to be only one of many departments. By the century's end, the erosion accelerated in the Ivy League. Charles Eliot introduced the "elective system" at Harvard, and Columbia reduced the liberal arts requirement to only two years before students moved on to professional schools.

In 1917, the erosion had turned to actual attacks on compulsory Latin and on the idea of foreign language study for any purpose other than practical communication. In response, a blue-ribbon classics conference was convened at Princeton. Its report, entitled *Value of the Classics*, offered defensive arguments that are familiar to today's humanities teachers: the classics are valuable "in disciplining the mind and conveying the values of western civilization," Latin especially has practical utility (e.g., in the languages of law, medicine, biology, as well as general vocabulary-building, etc.), and, spurred in part by the World War, a new value was introduced, "to inculcate the wisdom 'which springs from undying faith in truth and freedom'."

John Dewey's pedagogical philosophy served further to take the classics from a central position by dissolving the line between liberal and practical arts. Today, says Mooney, even "literary scholars and humanists generally have not been very helpful," as they reduce literature to mere texts without any vestiges of authority, and expunge classical works to make room for new voices. Yet, to Mooney, Cicero's voice still has power and sense, for the great orator allowed that while he preferred inarticulate wisdom to ignorant fluency, if the choice is available, "the prize must go to the orator who possesses learning." THE NATIONAL ASSOCIATION FOR HUMANITIES EDUCATION

BOARD OF DIRECTORS

President	James Mehl, Humanities, Missouri Western State College, St. Joseph, MO
President-Elect	Darrell Bourque, English, University of Southwestern Louisiana, Lafayette, LA
Past President	Sharon Scholl, Humanities, Jacksonville University, FL
At-large Directors	Vaughan Burdin Baker, Interdisciplinary Humanities, University of Southwestern Louisiana, Lafayette, LA
	Mark Edward Clark, Classics, University of Southern Mississippi, Hattiesburg, MS
	Carolyn Craft Leech, Communications, Jefferson Technical College, Steubenville, OH
	David M. Orenstein, Graduate Program in the Humanities, Wright State University, Dayton, OH
	Ronald W. Phillips, Humanities, Northeastern State University, Tahlequah, OK
	Mary Louise Shannon, Humanities, Florida Community College, Jacksonville, FL
Executive Secretary	Fred E. H. Schroeder, Interdisciplinary Programs, University of Minnesota, Duluth

SPECIAL SUPPLEMENT:

THE EIGHT-YEAR INDEX OF HUMANITIES EDUCATION VOLS. I - VIII

Title Index to Volumes I through VIII (January 1984-Fall 1991)

"Accessing Old Visions: American Mythology as a Unified Approach to American Studies". Hilsabeck, Steven A. and Legget, Susanne J., Vol. V, No. 3, pp. 3-12, Summer, 1988

"Adam and Romeo: The Many Meanings of Natural Things". LaMaster, Teresa K., Vol. VI, No. 3, pp. 15-18, Summer, 1989.

"Advanced Placement Humanities in the High School". Wallenberg, Nancy E., Vol. III, No. 2, pp. 27-29, May, 1986.

"African Thought in African Art". Scholl, Sharon, Vol. VIII, No. 3, pp. 19-26, Summer, 1991.

"All Things Fall And Are Built Again: Environmental Education in a Literary Context". Cowan, Laura, Vol. VII, No. 3, pp. 17-24, Summer, 1990.

"America on Trial: Studies in Values in Conflict". Parks, John G., Vol. IV, No. 3, pp. 5-12, Summer, 1987.

"ART WARE: Computers in the Art Museums". Williams, Jennifer, Vol. IV, No. 1, pp. 33-36, Winter, 1987.

"Arts, Humanities & the Criticism of Harold Bloom. Stimulating Thoughts about the Arts". Thorpe, Peter, Vol. III, No. 1, pp. 3-9, January, 1986.

"The Arts in New York City: Experiencing the Arts Live". Hulstrand, Janet, and Paoli, Dennis, Vol. VIII, No. 2, pp. 19-26, Spring, 1991.

"Beatles and Humanities, The". Gallian, Joseph, Vol. I, No. 3, pp. 21-27, September, 1984.

"Best Translations: The Color Purple". Jenny, Yolande, Vol. IV, No. 2, pp. 29-32, Spring, 1987.

"Best Translations" (Divine Comedy and Christian Morgenstern), Raffel, Burton, Vol. I, No. 3, pp. 32-35, Summer, 1984.

"Best Translations: Different Roads", (Guillevic). Raffel, Burton, Vol. IV, No. 3, pp. 33-34, Summer, 1987.

"Best Translations: The Importance of Being Laclos". Raffel, Burton, Vol. IV, No. 4, pp. 35-36, Fall, 1987.

"Best Translations: Mannly Prose". Raffel, Burton, Vol. IV, No. 2, pp. 27-28, Spring, 1987.

"Best Translations: Medieval German Narrative Verse". Conant, Jonathan B., Vol. II, No. 3, pp. 42-44, September, 1985.

"Best Translations: Prevert, Flaubert and Homer". Raffel, Burton, and Reedy, Jeremiah, Vol. II, pp. 40-46, May 1985.

"Best Translations: Roland and Oedipus". Raffel, Burton, and Reedy, Jeremiah, Vol. III, No. 1, pp. 53-60, January, 1986.

"Best Translations: Translating Prose: Sartre". Raffel, Burton, Vol. III, No. 2, pp. 31-32, May, 1986.

"Best Translations: Untranslatable? The Poetry of Stefan George". Raffel, Burton, Vol. V, No. 1, pp. 37-38, Winter, 1988.

"Best Translations: Villon and Goethe". Raffel, Burton, Vol. II, No. 1, pp. 43-46, January, 1985.

"Best Translations: Voltaire's Candide". Jenny, Yolande, Vol. V, No. 2, pp. 31-34, Spring, 1988.

"Best Translations: Whale Roads and Mead-Seats: Four Ways of Translating Beowulf". Bragg, Lois, Vol. III, No. 3, pp. 63-80, September 1986.

"Beyond the Pursuit of Geographic Trivia: Using U-Haul's *America's Moving Adventure* to Teach About Physical and Cultural Landscapes". Rallis-Reeder, Helen and Henderson, Martha, Vol. VII, No. 3, pp. 51-54, Summer, 1990.

"Bridging the Generation Gap With Humanities". Hoelting, Leona, Vol. IV, No. 2, pp. 21-26, Spring, 1987.

"Broader Understanding of Cultures Through Folk Literature". Davis, John C., Palmer, Jesse, and Smith, Ben A., Vol. VI, No. 3, pp. 31-38, Summer, 1989.

"Business Perceptions of Courses in the Humanities". Arno, Elsie, and Satlof, Marilyn R., Vol. I, No. 2, pp. 13-21, May, 1984.

"Christianity and Culture: Integrative Studies in the Core Curriculum". Labriola, Albert C. and Worgul, George S. Jr., Vol. VIII, No. 2, pp. 3-10, Spring, 1991.

"Christianity and the Cult of Dionysus". Dutra, John A., Vol. III, No. 3, pp. 5-11, September, 1986.

"The City as Theme in the Humanities Classroom—and as Unpopular Theme in Fine Arts." Schroeder, Fred E. H., Vol. VII, No. 3, pp. 31-38, Summer, 1990.

"Classical Literature in a Non-Classical Time: Ancient Ideas as a Sounding Board for Thinking and Writing". Martin, Jill, Vol. VI, No. 2, pp. 23-26, Spring, 1989.

"A Classicist's Guide to Defining Liberal Arts Education", Reedy, Jeremiah, Vol. I, No. 2, pp. 37-40, May, 1984.

"Community & Junior Colleges Humanities". Scholl, Sharon, Vol. IV, No. 2, pp. 31-32, Spring, 1987.

"A Compromise Approach to the Related Arts". Metz, Donald, Vol. VIII, No. 2, pp. 27-32, Spring, 1991.

"Computer is a Tool, Not a Subject". Shaffer, Stephen A., Vol. IV, No. 1, pp. 13-18, Winter, 1987.

"Computers & Humanities Education: Observations & Resources". Reding, Nancy C., Vol. IV, No. 1, pp. 37-39, Winter, 1987.

"Computing and the Humanities: A Curmudgen's View". Gulick, Walter B., Vol. VIII, No. 1, pp. 19-24, Winter, 1991.

"Computing and the Humanities: Three Perspectives". Introduction by Ess, Charles, Vol. VIII, No. 1, p. 3, Winter, 1991. (Entire Section pp. 3-28).

"Computers vs. Human Values?" Stringer, David H., Vol. IV, No. 1, pp. 19-21, Winter, 1987.

"Computing With Women in History". Gross, Susan H., Vol. II, No. 1, p. 58, January, 1985.

"Connecting Art and Science: A Conference Report". Scholl, Sharon, Vol. II, No. 1, pp. 57-58, January, 1985.

"Connections: Mathematics and the Humanities". Haack, Joel K., Vol. VI, No. 2, pp. 3-6, Spring 1989.

"Constructs of Human Experience: A Course in Interdisciplinary Humanities". Betanzos, Ramon, Vol. V, No. 3, pp. 19-24, Summer, 1988.

"Copyright Issues in the Humanities". (Videocassettes). Nevins, Francis M., Vol. I, No. 3, pp. 39-46, September, 1984.

"Copyright Issues in the Humanities: The Photocopy Issue". Nevins, Francis M., Vol. II, No. 1, pp. 49-55, January, 1985.

"Copyright Issues in the Humanities III: Videocassettes Revisited". Nevins, Francis M., Vol. II, No. 2, pp. 50-52, May, 1985.

"Copyright Issues in the Humanities IV: Copying Museum Pieces". Nevins, Francis M., Vol. II, No. 3, pp. 37-38, September, 1985.

"Copyright Issues in the Humanities V: Who Owns What Academics Create?" Nevins, Francis M., Vol. III, No. 1, pp. 49-51, January, 1986.

Please allow up to four weeks for delivery.

EDITORIAL POLICIES

How do we define "humanities education"? Any learning activities with **content** that draws upon the human cultural heritage, **methods** that derive from the humanistic disciplines, and a **purpose** that is concerned with human values. Academic courses don't have to be labeled "humanities" to be interdisciplinary. Integrated courses and units are often disguised under such names as World History, Freshman English, Music Appreciation, Beginning Spanish, Introduction to Religion, Senior Honors, etc. Integration can range from the use of a novel in a history course to team teaching to comprehensive thematic extravaganzas that combine the arts, literatures, philosophy and social sciences.

What "grade levels" do we include? All, from elementary to teacher education, adult public programs, graduate seminars, educational radio and television, museums and historic parks. Humanities education is a lifelong activity.

How about writing style? Write as if you are talking to a group of intelligent professionals who may not have the same background as yours. Treat your audience with respect and your topic with dignity. Feel free to employ first and second person, but do not feel constrained to be colloquial. Avoid sexist implications in your diction by referring to **humanity**, **humans** or **people** rather than **man** or **mankind**. Usually awkward "he/she" constructions can be avoided by recasting pronouns in the plural. Avoid jargon, but if you must use technical language supply a glossary or define as you go along. Rather than using formal footnotes append a brief list of recommended readings and/or resources, providing ordering information where necessary. If your article is applicable to one specific age group or educational setting, make this clear to your readers. In short, make it understandable, practical and useful.

Format? Typed or word-processed double-spaced on standard paper, original or photocopy. Place your name and affiliation as you wish to have it in print in the upper right-hand corner of the first page (no cover sheet) along with your mailing address and telephone number. Camera-ready line illustrations are very welcome. We can use written material of two lengths: one to three page commentaries, etc.; and articles of eight to ten pages (3500 word maximum). Because of the wide audience it is essential that we print a variety of shorter pieces, although from time to time longer materials may be used such as reports of major surveys of interest to all readers. Always retain a copy for your files and enclose a self-addressed envelope and loose return postage with your submissions. If you have **word-processed** your article, please specify the program you used (we use **WordPerfect**). If your article is accepted we'd like a copy on disk.

Copyright? With rare exceptions all material will be available to subscribers for personal non-profit educational uses without permission. Republication in any form, whether or not for profit is the exclusive right of the individual author and the editor.

WHAT KINDS OF ARTICLES WOULD WE LIKE TO PUBLISH?

The statement of purpose on the masthead says it all. The key words are HUMANITIES, EDUCATION and INTERDISCIPLINARY, but we are not necessarily limited to classroom practices and curricula. Thus, for example we are interested in:

- THEORY "Piaget and Theories of Integrated Study"
- ADMINISTRATION "Crediting Departments for Team Teaching"
- HISTORY "Nineteenth-Century Multi-Media at Chautauqua"
- RESEARCH "A Comparative Study of Writing Skills Development in Freshman Composition and Western Civilization"
- PEDAGOGY "Helping Students to Formulate Interdisciplinary Questions"

Also, things done in a strictly disciplinary mode are valid if they are presented as strategies for use in other settings:

- "What you should know about teaching novels in a philosophy course"
- "Pre-teaching history students for an art museum field trip"
- "How to help non-musicians to follow a score"
- "A designer speaks of humanities bulletin boards"
- "Getting adults to role-play in public humanities programs"
- "Understanding Oedipus: An Actor's View"

What we don't want:

- Creative writing by teachers or students (it doesn't relate to our purpose)
- Syllabus outlines (curricula should be explained, not listed)
- "The Structural Form of Camus' THE STRANGER" (send it to a literary journal or revise to relate it to interdisciplinary classroom teaching)
- "Influence of Botticelli on the Pre-Raphaelites" (same reasons, for art history)
- "Humanistic counseling in the admissions office" (this is a behavioral definition of humanism, not a cultural one)
